A thermophysical property correlation package of hydrogen, carbon monoxide, carbon dioxide and methane has been constructed from a critical evaluation of theoretical or empirical correlations available in the literature. The properties include density, isobaric specific heat, viscosity and thermal conductivity. Selected package correlations are summarized below: (1) For density, Peng-Robinson-Redlich-Kwong equation of state, (2) for specific heat, an expression from thermodynamic theory with the van der Waals equation of state and (3) for viscosity and thermal conductivity, generalized relationships by the use of dimensional analysis that were developed by G. Thodos group. From a comparative evaluation of the package correlations with measurements and selected values available, it has been concluded that except for specific heat these correlations are predictable with an acceptable accuracy. (author).

26928 (LUTMDN-TMVK–3157) **Mathematical models for heat exchangers.** Andersson, Sven. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. Mar 1993. 135p. (In Swedish). Order Number DE93500693. Source: OSTI; NTIS.

This report gives a theoretical treatment of the dynamics and control of heat exchangers, with special emphasis on thermostatic regulation of district heating connected through-flow tap water heaters. With the aid of Laplace transformation analytical expressions for different kinds of transfer functions are calculated. Inverse transforms is calculated as infinite series, where Bessel functions are included. The solutions agree well with results from computer simulations of a discrete heat exchanger model. It is shown, that the greatest risk for instabilities arises at medium-fast temperature sensing. The report also present an investigation of a return-reducing valve, which is shown to be stable in all conditions. (9 refs., 28 figs., 4 tabs.).

26929 (UCRL-JC–109143) **Dynamical simulations of sedimentation.** Ladd, A.J.C. Lawrence Livermore National Lab., CA (United States). Dec 1991. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9110369–3: 3. Joint Department of Energy/National Science Foundation (DOE/NSF) workshop on flow of particulates and fluids, Worcester, MA (United States), 22-24 Oct 1991). Order Number DE93013838. Source: OSTI; NTIS; GPO Dep.

In previous work I have developed a numerical technique for computing the hydrodynamic interactions between suspended solid spheres [1-31]. By averaging appropriate elements of the mobility matrix over random (non-overlapping) configurations of hard spheres, the high-frequency or short-time hydrodynamic transport coefficients can be calculated; the results are in excellent agreement with experiment [3]. During sedimentation. microstructure rearrangements take place; thus the steady-state sedimentation velocity can differ from its initial value. Moreover the suspension does not sediment as a homogeneous unit; rather there is a substantial dispersion of the particle velocities due to microscopic inhomogeneities in panicle position. In this paper I present results arising from the dynamical simulation of sedimenting spheres; I limit myself to results at a single packing fraction, $\phi = 0.05$, to compare with the experimental results of Ham and Homsy [5]. The methodology is a straightforward development of that described in Refs. [1-3] for creeping flow hydrodynamic interactions. Given the location and the force (gravity) on each particle. the velocity and angular velocity are calculated. In this work it has been assumed that the force density on the surface of each sphere, arising from its interactions with the fluid, can be represented by a force, a torque and a stresslet.

26930 (UCRL-JC-111404) **A Baroclinic Model of turbulent dusty flows.** Kuhl, A.L. Lawrence Livermore National Lab., El Segundo, CA (United States). Apr 1992. 54p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. Contract DNA IACRO-92-824. (CONF-9204142–2: DNA numerical methods symposium, Menlo Park, CA (United States), 28 Apr 1992). Order Number DE93017122. Source: OSTI; NTIS; GPO Dep.

The problem considered here is the numerical simulation of the turbulent dusty flow induced by explosions over soil surfaces. Some of the unresolved issues are: (1) how much dust is scoured from such surfaces; (2) where does the dust go in the boundary layer; (3) what is the dusty boundary layer height versus time; (4) what are the dusty boundary layer profiles; (5) how much of the dust mass becomes entrained into the dust stem; and (6) where does the dust go in the buoyant cloud? The author proposes a Baroclinic Model for flows with large density variations that actually calculates the turbulent mixing and transport of dust on an adaptive grid. The model is based on the following idealizations: (1) a loose dust bed; (2) an instantaneous shock fluidization of the dust layer; (3) the dust and air are in local equilibrium (so air viscosity enforces the no-slip condition); (4) the dust-air mixture is treated as a continuum dense fluid with zero viscosity; and (5) the turbulent mixing is dominated by baroclinically-generated vorticity. These assumptions lead to an inviscid set of conservation laws for the mixture, which are solved by means of a high-order Godunov algorithm for gasdynamics. Adaptive Mesh Refinement (AMR) is used to capture the turbulent mixing processes on the grid. One of the unique characteristics of these flows is that mixing occurs because vorticity is produced by an inviscid, baroclinic mechanism. A number of examples are presented to illustrate these baroclinic effects including shock interactions with dense-gas layers and dust beds, and dusty wall jets of airblast precursors. The conclusion of these studies is that dusty boundary layers grow because of mass entrainment from the fluidized bed (and not because of viscous wall drag) as proven by the Mass Integral Equation.

26931 (SAND-92-2090C) **Simulation of orbital debris impacts on bumper shields.** Hertel, E.S. Jr. Sandia National Labs., Albuquerque, NM (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9304135–2: 1. European conference on space debris, Darmstadt (Germany), 5-8 Apr 1993). Order Number DE93013773. Source: OSTI; NTIS; GPO Dep.

A series of numerical simulations have been performed using CTH to predict secondary debris formation and rear structure damage for typical bumper shields under a variety of impact geometries The simulations span a range of velocities from ~3 to 12 km/s and are compared to the experiment data for the lower velocities (3 to 7 km/s). For one velocity (~7 km/s), CTH was used to demonstrate the effects of bumper thickness on secondary debris formation and rear structure damage. CTH was also used to stimulate a 12 km/s impact of a sphere on a simple Whipple bumper shield and this result will be compared to analytic damage predictions at that velocity. It has been found that CTH accurately predicts secondary debris propagation and rear damage for velocities throughout the experimentally accessible range. The CTH damage predictions at 12 km/s result in a higher ballistic limit than would be predicted from the analytic techniques.

26932 (SAND-92-2460C) **Experimental technique to simulate orbital-debris impact on space shields at impact velocities over 10 km/s.** Chhabildas, L.C.; Boslough, M.B. Sandia National Labs., Albuquerque, NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9304135–1: 1. European conference on space debris, Darmstadt (Germany), 5-8 Apr 1993). Order Number DE93011619. Source: OSTI; NTIS; GPO Dep.

With the development of a new HyperVelocity Launcher, HVL, at Sandia, it is now possible to perform experiments over the velocity range of 7 to 12 km/s. This velocity range has not been previously accessible for gram-size plates. This meets the requisite mass-velocity criteria established for the orbital debris environment. In this paper, the technique employed to launch thin flier plates to velocities not previously accessible on a two-stage light-gas gun is reported. In particular, this technique has been used on a two-stage light-gas gun to launch nominally 0.5 to 1.0-mm thick aluminum, titanium, and magnesium flier plates intact to velocities up to 12.2 km/s. Since the mass-velocity capability of the newly developed HVL meets the average specifications of the space debris environment, it is expected to be a useful tool to evaluate the effects of debris impact on space structures and debris shields. Examples of a plate impact i.e., orbital debris impact on a thin Whipple shield are presented in this paper.

26933 (SAND-92-2712C) **Isolation of a piezoresistive accelerometer used in high acceleration tests.** Bateman, V.I.; Brown, F.A.; Davie, N.T. Sandia National Labs., Albuquerque, NM (United States). [1992]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9306170–1: 17. transducer workshop, San Diego, CA (United States), 22-24 Jun 1993). Order Number DE93013764. Source: OSTI; NTIS; GPO Dep.

Both uniaxial and triaxial shock isolation techniques for a piezoresistive accelerometer have been developed for pyroshock and impact tests. The uniaxial shock isolation technique has demonstrated acceptable characteristics for a temperature range of −50°F to +186°F and a frequency bandwidth of DC to 10 kHz. The triaxial shock isolation technique has demonstrated acceptable results for a temperature range of −50°F to 70°F and a frequency bandwidth of DC to 10 kHz. These temperature ranges, that are beyond the accelerometer manufacturer's operational limits of −30°F and +150°F, required the calibration of accelerometers at high shock levels and at the temperature extremes of −50°F and +160°F. The purposes of these calibrations were to insure that the accelerometers operated at the field test temperatures and to provide an accelerometer sensitivity at each test temperature. Since there is no NIST-traceable (National Institute of Standards and Technology traceable) calibration capability at shock levels of 5,000 g - 15,000 g for the temperature extremes of −50°F and +160°F, a method for calibrating and certifying the Hopkinson bar with a transfer standard was developed. Time domain and frequency domain results are given that characterize the Hopkinson bar. The NIST-traceable accuracy for the standard accelerometer in shock is ±5%. The Hopkinson bar has been certified by the Sandia Secondary Standards Division with an uncertainty of 6%.

26934 (CBL-40) **Densified cement ultra-fine particle-based materials.** Bache, H.H. Aalborg Portland (Denmark). Cement- og Betonlaboratoriet. 1981. 35p. (CONF-8106349–1: 2. International conference on superplasticizers in concrete, Ottawa (Canada), 10-12 Jun 1981). Order Number DE93500154. Source: OSTI; NTIS.

This paper describes a new class of materials with binders of densely packed cement and ultra-fine particles arranged in the spaces between the cement. The new materials are shaped from a viscous mass in a low stress field - in spite of an extremely low water content (0.13 - 0.18 by weight of cement + ultra-fine particles). The dense packing is achieved by using a large quantity of superplasticizer. Concrete made with the new binder is far more durable than ordinary concrete and has a 3-5 times higher compressive strength than this (120-270 MPa). The geometric, kinematic and

dynamic principles for arranging the fine particles in a dense structure are discussed, with special reference to the role of dispersing agents. The chapters on the hardened materials and applications concentrate mainly on the principles for developing new composite materials and structures that combine the excellent properties of the new binder with properties which this does not posses, for example, high tensile strength and ductility. (au) (21 refs.).

26935 (ENEA-RT-INN–91-17) **Progress in excimer lasers.** Letardi, T.; Fu, S. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Jun 1991. 31p. (CONF-9107262–1: 20. international conference on phenomena in ionized gases, Pisa (Italy), 8-12 Jul 1991; RT/INN–91-17). Order Number DE93799289. Source: OSTI; NTIS (US Sales Only); INIS.

The most attractive feature of excimer lasers is their capability to efficiently produce e.m. radiation in the UV region with high average or peak power, low divergence, narrow bandwidth and good spatial uniformity. These lasers are seen as good candidates as drivers in internal confinement fusion due to their good beam focussing capability and radiation absorption characteristics. A general look at developments which have occurred during the last decade in the commercialization of excimer lasers indicates an overall growing interest in these devices in the sectors of scientific research and industry. However, a more detailed examination of the most recent commercialization trend shows a decrease in applications. This paper examines the factors that may be causing this unexpected downturn in excimer laser applications and analyzes the current performance demands that are being placed on the high power density sources used in the lasers. Developments in excimer laser numerical codes and laser parameter measuring are also discussed. Two directions of development are suggested, i.e., F2 lasers and excimer fluorescent lamps, which appear to offer many interesting applications.

26936 (ETDE-IT–93-161) **ENEA compact millimetre wave FEL.** Doria, A.; Gallerano, G.P.; Giovenale, E.; Kimmitt, M.F.; Messina, G.; Renieri, A. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. 1993. 3p. (CONF-9309124–2: 18. annual international conference on infrared and millimeter waves, Colchester (United Kingdom), 6-10 Sep 1993). Order Number DE93799185. Source: OSTI; NTIS (US Sales Only).

This paper reports the performance characteristics of a compact Free Electron Laser (FEL) operating in the spectral range between 2 and 3.5 mm. A new scheme of laser pulse temporal-profile control is discussed together with the experimental results.

26937 (ETDE-IT–93-162) **Use of NAG routines for numerical simulation of free electron laser.** Dipace, A.; Sabia, E.; Vaccari, M. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta; ENEA, Bologna (Italy). 1992. 7p. (CONF-9209367–1: NAGUA '92 users conference, Canterbury (United Kingdom), 9-11 Sep 1992). Order Number DE93799232. Source: OSTI; NTIS (US Sales Only); INIS.

The simulation of a FEL (free electron laser) amplifier relies on the coupled Maxwell equations and on the Lorentz force expression. A simplified simulation code can be obtained with a 1-D approximation, neglecting the dependence of laser field, undulator field and beam density on transverse variables. In this case,one simply obtains a set of 2n + 2 coupled Ordinary Differential Equations (ODE), n being the number of metaparticles considered (typically 64 to 256) for the dynamical evolution of FEL variables. The simulation in this case uses the D02CBF routine from NAG (Nottingham Algorithms Group) Fortran Library. The Adams method is very accurate and fast for each integration step. Moreover, the interpolation routine OUTC is very useful in saving further work because it allows dynamical variables to be computed while using a very long integration step. The implementation of the complete 3-D model is not an easy task. The main difference is that laser field equations become PDE's. This system of equations, plus boundary conditions, is transformed into a mixed algebraic-differential system by a Galerkin-type finite element method. Solution of the resulting set of algebraic and differential equations is obtained through the package D02NGF of the NAG Fortran Library well suited for MAD systems. To our knowledge, D02NGF is the best available routine for this purpose: efficient, easy to use and equipped with very clear diagnostics.

26938 (ETDE-IT–93-169) **Laser mirrors with variable reflected intensity and uniform phase shift.** Piegari, A.; Emiliani, G. ENEA, Casaccia (Italy). 1992. 3p. (CONF-9206138–3: 5. topical meeting on optical interference coating, Tucson, AZ (United States), 1-5 Jun 1992). Order Number DE93799190. Source: OSTI; NTIS (US Sales Only).

Mirrors with gaussian or super-gaussian reflected intensity profiles, used as output couplers of unstable laser resonators, give high-power diffraction-limited laser beams. Unfortunately, these devices often introduce a phase distortion of the transmitted wave front that can reduce the advantages of having a smooth intensity profile. Therefore, the phase profile should be controlled with proper design techniques. This paper illustrates this point by studying the optimum design of a coating for a high power carbon dioxide laser with a required intensity profile and a rather small radial phase variation. The paper explains why a multi-layer coating with only one variable layer is preferred, and suggests an alternative approach, consisting in the use of a mirror having a partial reflectance region in its center and an anti-reflection region in the surrounding area, to avoid the phase front distortion.

26939 (ETDE-IT–93-170) **Optimisation procedures using 'eye' merit function.** Piegari, A.; Emiliani, G. ENEA, Casaccia (Italy). 1992. 2p. (CONF-9206138–4: 5. topical meeting on optical interference coating, Tucson, AZ (United States), 1-5 Jun 1992). Order Number DE93799191. Source: OSTI; NTIS (US Sales Only).

An easy to use and versatile design tool, which reduces the risk of having undesired reflectance values at wavelengths not covered by conventional calculations, is suggested for the optimization of optical coatings. It consists of the use of a merit function combined with the simplex optimization method to simulate the action of the human eye evaluating how much a calculated optical coating performance curve approaches the desired curve. An illustrative example is given of the design of wide band antireflection coating for the infrared range.

26940 (ETDE-IT–93-180) **Numerical simulation of FEL amplifiers by NAG routines.** Dipace, A.; Sabia, E.; Vaccari, M. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta; ENEA, Bologna (Italy). 1992. 7p. (CONF-9202182–1: NAG European technical seminar: Numerical and symbolic computations, Bologna (Italy), 18 Feb 1992). Order Number DE93799267. Source: OSTI; NTIS (US Sales Only); INIS.

The Free Electron Laser (FEL) is a device which converts the kinetic energy of a relativistic electron beam into coherent radiation. FEL interaction is represented by a coupled set of ordinary and partial differential equations describing laser field evolution. These numerical problems can be efficiently solved by NAG (Nottingham Algorithms Group) routines D02NGF and D02CBF, as shown in this communication.

26941 (ETDE-IT–93-190) **Saturation and cavity losses optimization in free electron lasers.** Dattoli, G.; Giannessi, L.; Torre, A. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. 1992. 12p. Order Number DE93799200. Source: OSTI; NTIS (US Sales Only).

This paper reconsiders the problem of optimum cavity losses for FEL (Free Electron Laser) operation. It uses the results of a recently proposed 1-dimensional saturation model and shows that, for large intra-cavity intensities, the FEL behaves as a conventional laser system.

26942 (KCP–613-5041) **Elimination of sodium cyanide and vapor degreasing from the passivation process.** Stimetz, C.J.; McKay, W.P. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Apr 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE93013937. Source: OSTI; NTIS; GPO Dep.

This report is an examination of the vapor degreasing and alkaline descaling steps in the passivation process. Since parts that are to be passivated are fairly clean, the vapor degreasing step may be redundant. Sodium cyanide is a component of the alkaline descaling solution and would be desirable to eliminate because of environmental concerns. Evaluations were performed to determine if the vapor degreasing step could be eliminated and the cyanide removed from the descaling solution. The stainless steels used in these evaluations were 15-5 PH and 303 SE wrought materials and 17-4 PH casting material. Samples of these stainless steels were contaminated with five materials normally encountered prior to the passivation process. The contaminated samples were then passivated with the standard process and the modified process in which the vapor degreasing step was eliminated and the sodium cyanide removed from the descaling solution. After the passivation of these contaminated samples, Auger Electron Spectroscopy (AES) was used to measure the effectiveness of the standard and modified passivation processes.

26943 (KCP–613-5043) **Rigid-flexible printed wiring boards: Final report.** Sydow, E.V. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. May 1993. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE93013938. Source: OSTI; NTIS; GPO Dep.

Rigid-flexible printed wiring board materials, fabrication processes, product requirements, and reliability were established. Considerable effort was spent testing plated-through holes, analyzing plated-through hole failure mechanisms, and then incorporating materials, processes, and product requirements to provide adequate control and reduce failures. The principal processes developed were tooling concepts, process sequence, lamination, drilling, plasma etchback, copper electroplating, and solder coating. Product requirements and reliability were established with thermal shock, thermal stress, innerlayer adhesion, and fold flexibility tests. Plated-through hole failure mechanisms were analyzed with thermal mechanical and finite element analyses.

26944 (KCP–613-5078) **Miniature mechanism assembly: Final report.** Stubenhofer, R.L. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. May 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE93015595. Source: OSTI; NTIS; GPO Dep.

Miniature assembly operations were reviewed to provide candidates for improvements to part handling, assembly, fixturing, equipment setup, and work verification. Four areas of emphasis were chosen – two specific products and two generic processes. The work done in conjunction with this project resulted in improvements to flowtimes and yields. Groundwork for further improvements in miniature assembly operations is now in place.

26945 (LA-UR–93-1212) **Optical degradation issues for XUV projection lithography systems.** Newnam, B.E. Los Alamos National Lab., NM (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-921047–3: Symposium on optical materials for high-power lasers, Boulder, CO (United States), 28-30 Oct 1992). Order Number DE93012658. Source: OSTI; NTIS; GPO Dep.

We review the degradation susceptibility of the various optical components proposed for use in XUV projection lithography systems at 13–20 nm. Contamination by laser plasma target debris and carbonaceous films are two primary hazards that must be essentially nullified. Pertinent experimental results of a number of researchers illustrate the present status.

26946 (LBL–33886) **Changes in electrical device characteristics during the formation of dislocations in situ in the TEM.** Ross, F.M. (Lawrence Berkeley Lab., CA (United States)); Hull, R.; Bahnck, D.; Bean, J.C.; Peticolas, L.J.; King, C.A.; Kola, R.R. Lawrence Berkeley Lab., CA (United States). Mar 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9304150–1: 8. conference on microscopy of semiconducting materials, Oxford (United Kingdom), 5-8 Apr 1993). Order Number DE93013910. Source: OSTI; NTIS; GPO Dep.

By adding electrical connections to a specimen heating holder for a transmission electron microscope, we have measured the characteristics of electronic devices such as diodes while they remain under observation in the microscope. We have made electron-transparent specimens from metastable GeSi/Si p-n junction diodes and introduced dislocations by heating in situ. The combination of electrical measurement and real-time observation of dislocation formation allows us to examine the electrical properties of dislocations in individual devices and the influence of defects on device performance.

26947 (SAND–92-2512C) **Thermal stress analyses of a header plate with a 51-PIN electrical feed-thru.** Bergmann, V.L.; McCollister, H.L. Sandia National Labs., Albuquerque, NM (United States). [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9309129–1: American Society of Mechanical Engineers (ASME) international electronics packaging conference, Binghampton, NY (United States), 29 Sep - 2 oct 1993). Order Number DE93011683. Source: OSTI; NTIS; GPO Dep.

An electronic package currently under development requires a hermetically-sealed electrical connection through a metal header plate. The electrical feedthru consists of 51 RA333 pins in an S-type glass ceramic insulator. Because the feedthru contains a large number of pins spaced closely together, a single glass preform rather than individual glass beads at each pin has been proposed. Finite element analyses were conducted to gain insight into the stress distribution in the header plate, glass, and pins. To verify the finite element analyses, a prototype part was manufactured and examined for cracking in the glass ceramic and for leakage of the glass-to-metal seal. Finite element analyses were then used to investigate effects of the plate geometry and yield strength on stresses in the assembly. This paper illustrates one way that finite element analyses can be used along with selective prototype manufacturing for a timely and cost-effective method of evaluating design parameters of electronic packages.

26948 (SAND–93-0910) **Evaluation of midband analog fiber optic telemetry links.** Hansen, G.J. Sandia National Labs., Albuquerque, NM (United States). May 1993. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93015128. Source: OSTI; NTIS; GPO Dep.

Midband (1KHz – 500MHz) analog fiber optic data links were purchased for evaluation from three suppliers. Ortel Corp., Alhambra, CA, provided units built to the specifications. Kaman Sciences Corp, Colorado Springs, CO and Laser Diode Inc., Princeton, NJ, provided units similar to the specification but with significant differences. The final version of the Ortel units met the specification but were marginal in dynamic range. The other units failed to meet the specification but showed promise for future application.

26949 (SAND–93-1280C) **Development of uhf spark-switched L-C Oscillators.** Rinehart, L.F.; Aurand, J.F.; Lundstrom, J.M.; Frost, C.A.; Buttram, M.T.; Patterson, P.E.; Crowe, W.R. Sandia National Labs., Albuquerque, NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930616–2: 9. IEEE pulsed power conference, Albuquerque, NM (United States), 21-23 Jun 1993). Order Number DE93015019. Source: OSTI; NTIS; GPO Dep.

Spark switched L-C Oscillator (LCO) transmitters have operated in the Low, Medium, and High Frequency Bands (10's of kHz to 10's of MHz) throughout the history of radio. In the 1970's they were pushed into the vhf Band by Moran, et al. By applying ultra-fast gas switching techniques and by overcoming spark gap losses the authors have operated LCO transmitters in the uhf (300 MHz to 3 GHz) region. Repetition rates >1 kHz with peak voltages >100 kV have been achieved. Uhf oscillators are inherently small because of the low inductance and capacitance required to generate ultra-high frequencies. This size constraint forces the device to operate at very high voltage in order to store enough energy to drive the antenna in spite of series switch losses and parallel corona and stray capacity losses. The spark gap must close in a time short compared to one half an R-F cycle for efficient switching; this equates to a few hundred picoseconds at uhf. The LCO output is a damped sinusoid of a few cycles duration. While the fractional

bandwidth (3-dB bandwidth divided by the center frequency) can be 10% to 80% depending on the Q, it is much smaller than the bandwidth of UWB impulse sources (100% bandwidth with multioctave coverage). Compared to UWB, the narrower bandwidth permits the use of higher gain antennas which can efficiently increase the effective radiated power (ERP) over a given frequency range. The authors have constructed L-C Oscillators with center frequencies of 450 MHz up to 800 MHz. The Q of these oscillators varies from 6 to 8 for the 450 MHz device, down to 1 to 2 for the 800 MHz unit. Q is increased when a resonant antenna or antenna-reflector combination is added. Prototypes with simple fat-dipole antennas and small parabolic reflectors (8 inches x 20 inches) have radiated normalized electric field strengths of 30 kV/m at 1 meter (measured in far-field and extrapolated back to 1 meter).

26950 (UCRL-ID–113182) **Design and performance of the terawatt Cr:LISrAlF$_6$ laser system.** Ditmire, T.; Nguyen, H.; Herman, S.; Perry, M.D. Lawrence Livermore National Lab., CA (United States). 28 Jan 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014678. Source: OSTI; NTIS; GPO Dep.

The authors have developed a compact, flashlamp-pumped Cr:LiSrAlF$_6$ laser system capable of producing peak powers in excess of one terawatt. The chirped pulse amplification approach has been optimized for amplification of femtosecond pulses in Cr:LiSrAlF$_6$. The system includes a Cr:LiSAF regenerative amplifier followed by a Cr:LiSAF power amplifier chain. The regenerative amplifier produces 12 mJ pulses at a 5 Hz repetition rate which are further amplified to energies above 300 mJ at a 0.5 Hz repetition rate. Recompression results in a pulse energy of 150 mJ and pulse duration of under 135 fsec.

26951 (UCRL-JC–109341) **Design, fabrication and testing of a miniature peristaltic membrane pump.** Folta, J.A.; Raley, N.F.; Hee, E.W. Lawrence Livermore National Lab., CA (United States). Apr 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9206172–4: Solid state sensor and actuator workshop, Hilton Head Island, SC (United States), 21-25 Jun 1992). Order Number DE93013040. Source: OSTI; NTIS; GPO Dep.

A miniaturized peristaltic membrane pump has been designed, fabricated, and tested. Sequentially bulging three membranes into a flow channel will provide peristaltic pumping action. The deflection response of various membrane materials to applied pressure was measured to provide specifications for the flow channel which was designed and fabricated to closely match the shape of the bulging membranes. The pump has been designed to be driven with thermopneumatic actuators. Currently, an external pneumatic system is used to actuate the membranes to allow measurement and control of the actuation pressures required to demonstrate pumping action.

26952 (UCRL-JC–109388) **Recent results from material processing studies on new generation lasers.** Kautz, D.D.; Dragon, E.P.; Werve, M.E.; Hargrove, R.S. Lawrence Livermore National Lab., CA (United States). 9 Dec 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930658–1: 5. international conference on welding and melting by electron and laser beams, La Baule (France), 14-18 Jun 1993). Order Number DE93013841. Source: OSTI; NTIS; GPO Dep.

High power and radiance dye lasers developed at Lawrence Livermore National Laboratory show promise for material processing tasks. Evaluation using welding heat flow models suggests significant increases in precision and speed are expected. We started processing studies to determine the viability of these lasers for cutting and drilling. Titanium and stainless steel alloys were chosen as materials for the preliminary studies. Results show that cuts and holes with extremely fine features can be made with dye and copper-vapor lasers. High radiance beams produce low distortion and small heat affected zones. We have accomplished very high aspect ratios and micron scale kerfs and holes in both stainless steel and titanium alloys.

26953 (UCRL-JC–110706) **The Livermore X-ray Laser Program.** Matthews, D.L. Lawrence Livermore National Lab., CA (United States). 20 Aug 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920523–14: 3. international colloquium on x-ray lasers, Schliersee (Germany), 18-22 May 1992). Order Number DE93014118. Source: OSTI; NTIS; INIS; GPO Dep.

I will report on the status of x-ray laser development and its applications at Livermore. I will review some of our recent results and comment on where our future research is headed including plans for developing a compact x-ray laser users facility. Finally, I will briefly summarize the results of an X-ray Laser Applications Workshop that was held in San Francisco in January 1992.

26954 (UCRL-JC–111213) **Multi-frame x-ray imaging with a large area 40ps camera.** Bell, P.M. (Lawrence Livermore National Lab., CA (US)); Kilkenny, J.D.; Landen, O.L.; Hanks, R.L.; Wiedwald, J.D.; Bradley, D.K. Lawrence Livermore National Lab., CA (United States). 9 Nov 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920792–65: 37. annual Society of Photo-Optical Instrumentation Engineers (SPIE) international symposium on optical and optoelectronic applied science and engineering, San Diego, CA (United States), 19-24 Jul 1992). Order Number DE93017179. Source: OSTI; NTIS; GPO Dep.

The authors have developed a large area short pulse framing camera that is capable of sixteen frames and shutter times of 40ps per frame. This is accomplished with a high fidelity electrical circuit and a L/D = 20 microchannel plate, driven by a short pulse (80ps) high amplitude electrical driver. They show results of this work they have done to support this type of shutter time and the difficulties associated with large area high speed shuttering.

26955 (UCRL-JC–111851) **Optical and physical properties of the LiSrAlF$_6$:Cr laser crystal.** Smith, L.K.; Payne, S.A.; Tassano, J.B.; DeLoach, L.D.; Kway, W.L.; Krupke, W.F. Lawrence Livermore National Lab., CA (United States). 18 May 1993. 5p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9302116–2: 8. Optical Society of America (OSA) meeting on advanced solid-state lasers, New Orleans, LA (United States), 1-3 Feb 1993). Order Number DE93014657. Source: OSTI; NTIS; GPO Dep.

We have measured several of the physical and optical parameters of the LiSrAlF$_6$:Cr or Cr:LiSAF laser material that are important to its laser performance, including the thermomechanical properties, water durabilities and Auger upconversion constants. A thermomechanical figure-of-merit has been determined from measurements of the fracture toughness, expansion coefficient, thermal conductivity, Young's modulus, and heat capacity. Tests of water durability suggest that a neutral pH of 7 is optimum to minimize water dissolution. The Auger effect was found to be a significant factor at higher Cr concentration, where excited-state migration leads to an increase in the upconversion rate. 17 refs, 1 fig, 4 tabs.

26956 (UCRL-JC–112163) **Repair of opaque defects on reflection masks for soft x-ray projection lithography.** Hawryluk, A.M. (Lawrence Livermore National Lab., CA (United States)); Stewart, D. Lawrence Livermore National Lab., CA (United States). Nov 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920575–1: Symposium on electron, ion and photon beams, Orlando, FL (United States), 26-29 May 1992). Order Number DE93015114. Source: OSTI; NTIS; GPO Dep.

We have developed a new technique for the repair of opaque defects on soft x-ray projection lithography reflection masks using ion beam etching. This technique clears the defect without damaging the multilayer mirror or introducing an absorptive element into the multilayer. Our procedure uses a thin, Si overcoat to protect the multilayers from the kinetic energy of the in beam, reduced ion beam energy, and a Ar or Si ion beam to avoid absorption losses.

26957 (UCRL-JC–112217) **Full-wave simulation of the thumbtack laser.** Hawkins, R.J.; Madsen, N.K.; Kallman, J.S.; Feit, M.D.; Shang, C.C.; Shore, B.W.; DeFord, J.F. Lawrence Livermore National Lab., CA (United States). Nov 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract

W-7405-ENG-48. (CONF-930332–1: Optical Society of America integrated photonics research topical meeting, Palm Springs, CA (United States), 22-25 Mar 1993). Order Number DE93015110. Source: OSTI; NTIS; GPO Dep.

The whispering-gallery mode microdisk – or thumbtack – laser is a novel, strongly confining, microstructure with "potential for the integrability and low-power operation required for large-scale photonic integration". It is a thin dielectric ($n \approx 3.5$) cylinder – or disk – on top of a rhomboid post. Analysis of the optical modes of this structure have, to date, consisted of scaling arguments drawn from the theory of whispering-gallery spheres. While this analysis has proved useful in understanding the basic aspects of the operation of this laser, it is limited. The authors have undertaken a complete electromagnetic analysis of the thumbtack laser using 2-D, 2.5-D and 3-D Finite-Difference Time-Domain (FDTD) codes which range in complexity from 2-D studies of the mode structure of the disk to a geometrically complete 3-D analysis of the radiation emitted from the laser. The goal of this project is to predict changes in the optical behavior that accompany structural changes in and about the laser described elsewhere in these proceedings, and to guide optimized device design.

26958 (UCRL-JC–113290) **Experimental measurements of selenium x-ray laser spectral line profiles.** Koch, J.A. (Lawrence Livermore National Lab., CA (US)); MacGowan, B.J.; Da Silva, L.B.; Matthews, D.L.; London, R.A.; Lee, R.W.; Mrowka, S.; Underwood, J.H.; Batson, P.J. Lawrence Livermore National Lab., CA (United States); Lawrence Berkeley Lab., CA (United States). 1 Mar 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;AC03-76SF00098. (CONF-921256–5: 1992 international conference on lasers, Houston, TX (United States), 7-11 Dec 1992). Order Number DE93016543. Source: OSTI; NTIS; GPO Dep.

The authors discuss their recent measurements of the spectral width of the 206.38 Å x-ray laser transition in Ne-like Se. These measurements used a high-resolution grating spectrometer and were performed over a wide range of laser amplifier lengths. The data have enabled them to extrapolate the intrinsic line width and to observe the effects of gain-narrowing and saturation on the line profile. They find an intrinsic width which is 1.4 times the Doppler width, they observe gain-narrowing in intermediate length amplifiers, and they observe no re-broadening in long, saturated amplifiers. These results suggest that collisional line-broadening has a significant effect on the line profile and saturation behavior of this laser.

26959 (UCRL-JC–113407) **Laser and spectroscopic properties of Yb-doped apatite crystals.** DeLoach, L.D. (Lawrence Livermore National Lab., CA (United States)); Payne, S.A.; Krupke, W.F.; Smith, L.K.; Kway, W.L.; Tassano, J.B.; Chai, B.H.T. Lawrence Livermore National Lab., CA (United States). 18 May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9302116–1: 8. Optical Society of America (OSA) meeting on advanced solid-state lasers, New Orleans, LA (United States), 1-3 Feb 1993). Order Number DE93014656. Source: OSTI; NTIS; INIS; GPO Dep.

Favorable spectroscopic and laser properties were measured in several Yb-doped apatite crystals: $Ca_5(PO_4)_3F$, $Sr_5(PO_4)_3F$, and $Ca_{5-x}Sr_x(PO_4)_3F$ (x=1-3). The properties included absorption and emission spectra, and laser pumping (slope efficiency).

26960 (IFVE-OMVT–92-39) **The possibility of expert system application to accelerator control.** Afonin, A.G.; Volkov, B.S.; Ukhov, V.I. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. [16p.] (In Russian). Order Number DE93628247. Source: OSTI; NTIS (US Sales Only); INIS.

This report gives the introduction to expert system and its utilization in high energy physics. Some examples of expert system applications to the accelerator control are considered. Approach to expert system development for U-70 extraction system is suggested. 11 refs.; 3 figs.

26961 (LA-UR–93-1704) **Rigid-beam model of a high-efficiency magnicon.** Rees, D.E. (Los Alamos National Lab., NM (United States)); Tallerico, P.J.; Humphries, S.J. Jr. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–87: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014431. Source: OSTI; NTIS; INIS; GPO Dep.

The magnicon is a new type of high-efficiency deflection-modulated amplifier developed at the Institute of Nuclear Physics in Novosibirsk, Russia. The prototype pulsed magnicon achieved an output power of 2.4 MW and an efficiency of 73% at 915 MHz. This paper presents the results of a rigid-beam model for a 700-MHz, 2.5-MW 82%-efficient magnicon. The rigid-beam model allows for characterization of the beam dynamics by tracking only a single electron. The magnicon design presented consists of a drive cavity; passive cavities; a pi-mode, coupled-deflection cavity; and an output cavity. It represents an optimized design. The model is fully self-consistent, and this paper presents the details of the model and calculated performance of a 2.5-MW magnicon.

26962 (ANL/EP/CP–79507) **The Continuous Wave Deuterium Demonstrator (CWDD) design and status.** Todd, A.M.M. (Grumman Space and Electronics Corp., Princeton, NJ (United States)); Nightingale, M.P.S.; Yule, T.J. Argonne National Lab., IL (United States). [1992]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Contract DASG60-88-C-0060. (CONF-930511–4: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93012940. Source: OSTI; NTIS; GPO Dep.

The design of the Continuous Wave Deuterium Demonstrator (CWDD) and the status of the fabricated hardware is presented. The CWDD is a high brightness, 352 MHz, CW linear accelerator designed to deliver a 7.54 MeV, 80 mA D^- beam at a transverse normalized rms emittance of 0.11 π mm-mrad and a longitudinal rms emittance of 0.20 π mm-mrad. End-to-end beam dynamics analysis for nominal and off-design conditions is described. The tuning and predicted operational performance os the as-built device are also discussed. These results all indicate that the present design can meet the output performance specifications in the presence of combined errors at the limits of the specified engineering tolerances. Preliminary injector operations have been conducted at AEA Technologies, Culham Laboratory and at Argonne National Laboratory, where the CWDD is sited. Initial RGQ beam experiments at Argonne are projected for October 1993. DTL installation and commissioning will be completed in 1994.

26963 (BNL–48220) **Operation of the Brookhaven AGS with the Booster.** Weng, W.T. Brookhaven National Lab., Upton, NY (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–160: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015405. Source: OSTI; NTIS; INIS; GPO Dep.

The Brookhaven Alternating Gradient Synchrotron (AGS) received protons directly from a Linac and heavy ions directly from a Tandem Van de Graaff before 1992. The newly constructed Booster has been brought on line to serve as an injector for the AGS. The operational status of the acceleration of proton and heavy ions through the Booster and the AGS is reviewed. Accelerator improvement programs to increase proton intensity for physics research and to prepare heavy ion beams for RHIC injection are discussed.

26964 (DOE/ER/40648–2) **Experimental and theoretical investigation of high gradient acceleration: Progress report, February 1, 1992–January 31, 1993.** Wurtele, J.S.; Bekefi, G.; Chen, C.; Chen, S.C.; Temkin, R.J. Massachusetts Inst. of Tech.,

Cambridge, MA (United States). Plasma Fusion Center. Jan 1993. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40648. Order Number DE93015883. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains a technical progress summary of the research conducted under the auspices of DOE Grant No. DE-AC02-91-ER40648, "Experimental and Theoretical Investigations of High Gradient Acceleration". This grant supports three research tasks: Task A consists of the design, fabrication and testing of a 17GHz RF photocathode gun, which can produce 2ps electron pulses with up to 1nC of charge at 2MeV energy and at a 1OHz repetition rate. Task B supports the testing of high gradient acceleration at 33GHz structure, and Task C comprises theoretical investigations, both in support of the experimental tasks and on critical physics issues for the development of high energy linear colliders.

26965 (ENEA-RTI-INN–92-20) **Autofocussing LINAC: ENEA study.** Picardi, L.; Ronsivalle, C.; Vignati, A. ENEA, Frascati (Italy). 1992. 16p. (In Italian). (RTI-INN–92-20). Order Number DE93799243. Source: OSTI; NTIS (US Sales Only); INIS.

Recent industrial demand for a mobile radiographic system has led to the study and development, by ENEA (the Italian Agency for New Technology, Energy and the Environment) and the IRVIN Electronics Company, of a 5 MeV radiographic LINAC operating in the S band. The necessity of having a compact system to drastically reduce the overall weight of the equipment led to the design of a dynamic autofocussing system which eliminates the need for the usual focalizing solenoid. This paper outlines the key design, operation and performance features of this compact LINAC.

26966 (FNAL/C–93/123) **Multibunch operation in the Tevatron Collider.** Holt, J.A.; Finley, D.A.; Bharadwaj, V. Fermi National Accelerator Lab., Batavia, IL (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-930511–139: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014924. Source: OSTI; NTIS; INIS; GPO Dep.

The Tevatron Collider at Fermilab is the world's highest energy hadron collider, colliding protons with antiprotons at a center of mass energy of 1800 GeV. At present six proton bunches collide with six antiproton bunches to generate luminosities of up to 9 x 10^{30} $cm^{-2}s^{-1}$. It is estimated that to reach luminosities significantly greater than 10^{31} $cm^{-2}s^{-1}$ while minimizing the number of interactions per crossing, the number of bunches will have to be increased. Thirty-six bunch operation looks like the most promising plan. This paper looks at the strategies for increasing the number of particle bunches, the new hardware that needs to be designed and changes to the operating mode in filling the Tevatron. An interactive program which simulates the filling of the Tevatron collider is also presented. The time scale for multibunch operation and progress towards running greater than six bunches is given in this paper.

26967 (LAL-RT–93-01) **RF system options for the τ-C factory.** Huang Nan (Institute of High Energy Physics, Beijing, BJ (China). The Electron LINAC Dept.). Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire. Feb 1993. [42p.] Order Number DE93631021. Source: OSTI; NTIS (US Sales Only); INIS.

The properties of seven cavities are compared and three of them may be recommended for the τ-c factory. The simple approximate formulae to estimate the threshold impedances of couple-bunch instabilities for HOM resonances in RF cavities are given.

26968 (LA-UR–93-1387) **Future facilities for high-resolution (π, K) and other pion reactions at 1 GeV.** Thiessen, H.A.; Zumbro, J.D. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930389–9: Future directions in particle and nuclear physics at multi-GeV hadron beam facilities, Upton, NY (United States), 4-6 Mar 1993). Order Number DE93012680. Source: OSTI; NTIS; INIS; GPO Dep.

In 1991, the LAMPF Users considered a facility based on a pion linac (PILAC) to provide pions of up to 1 GeV for (π, K) and other pion reactions at LAMPF. We have extended this proposal to a version appropriate for high-energy proton accelerators by raising the pion injection energy and shortening the pion linac so that it is used as a rf separator and bunch rotator (SCRUNCHER). We have then estimated the yield of pions on target expected at LAMPF (PILAC), LAMPF assuming a proton energy upgrade to 2 GeV at 1 mA, the proposed KAON facility at TRIUMF, the Brookhaven AGS with booster, and the Fermilab Main Injector.

26969 (LA-UR–93-1879) **Operation of the high brightness linac for the advanced free-electron laser initiative at Los Alamos.** Sheffield, R.L.; Austin, R.H.; Chan, K.C.D.; Gierman, S.M.; Kinross-Wright, J.M.; Kong, S.H.; Nguyen, D.C.; Russell, S.J.; Timmer, C.A. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–42: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014471. Source: OSTI; NTIS; INIS; GPO Dep.

Free-electron lasers and high energy physics accelerators have increased the demand for very high-brightness beam sources. This paper describes the design of an accelerator which has produce beams of less than 2.1 π mm-mrad at 1 nC and emittances of 3.7 and 6.5 π mm-mrad for 2 and 3 nC, respectively. The accelerator has been operated between 10 and 18 MeV.The beam emittance growth in the accelerator is minimized by using a photoinjector electron source integrated into the design of the linac, a focusing solenoid to correct the emittance growth caused by space charge, and a special design of the coupling slots between accelerator cavities to minimize quadrupole effects.

26970 (LA-UR–93-2090) **Design study for a superconducting proton linac from 20 to 100 MeV.** Wangler, T.P.; Garnett, R.; Krawczyk, F.; Billen, J.; Bultman, N.; Christensen, K.; Fox, W.; Wood, R. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–211: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93016626. Source: OSTI; NTIS; INIS; GPO Dep.

Advances in superconducting radiofrequency technology during the past 15 years have made possible the large-scale application of superconducting niobium accelerators. So far this development has been restricted to rather low-current electron and heavy-ion accelerators. In addition to the power savings, the improved capability of superconducting cavities to provide acceleration of high currents with low beam losses, which follows from the ability to use larger beam apertures without a large economic penalty from increased rf losses, could make superconducting proton linacs very attractive for high-intensity applications, where activation of the accelerator is a major concern. During the past year, at Los Alamos, the authors have been looking at a possible upgrade to the 800-MeV LAMPF proton accelerator, to provide higher intensity injection into a new storage ring for a new high-intensity pulsed neutron source. As part of this upgrade to the LAMPF accelerator, the entire linac below 100 MeV would be rebuilt to provide improved beam quality, improved reliability, and to include funneling at 20 MeV for higher beam currents. Both a room-temperature and a superconducting option are being considered for the section from 20 to 100 MeV. At present, this section is a 201.25 MHz room-temperature copper drift-tube linac (DTL). For this new upgrade scenario the frequency from 20 to 100 MeV was fixed at 805 MHz. The new duty factor is assumed to be 7.2%, and the authors show some results at two currents, 30 mA and 150 mA, that span the range of interest. Their superconducting linac concept consists of individual multicell cavities, each driven by a klystrode. Focusing would be provided by superconducting quadrupole lenses between cavities. In the remainder of the paper they describe their study to evaluate the potential of a superconducting proton linac section for this application, and address some of the many design choices.

26971 (LBL–33089) **The Bevalac long flattop.** Celata, C.M.; Abbott, S.; Bennett, M.; Bordua, M.; Calvert, J.; Dwinell, R.; Howard, D.; Hunt, D.; Feinberg, B.; Force, R.; Frias, R.; Kalnins, J.; Lewis, S.; Nyman, M.; Shalz, L.; Solomons, S.R.; Tekawa, M. Lawrence Berkeley Lab., CA (United States). Oct 1992. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract

AC03-76SF00098. Order Number DE93015223. Source: OSTI; NTIS; INIS; GPO Dep.

Until July of 1992, the maximum length of the Bevalac flattop was 2 seconds, limiting the beam spill to 1.5 seconds. The normal running condition was a 1.5 second flattop, with a 1.0 second beam spill. If we define the duty factor as the spill length (in time) divided by the synchrotron pulse length, that is, the percentage of time the Bevalac can deliver beam to experiments, the duty factor for the 1.5 second flattop ranged from 17% (at full field, i.e., 12575 G) to 25% (low field). The purpose of the Long Flattop Project was to increase the length of the flattop, thus increasing the duty factor of the machine, and its efficiency for experiments. This has been done, with resultant increase in the duty factor and experimental data rate. It is now possible to run with duty factor of about 80% for low fields, falling to about 60% at 10 kG, and 34% at full field. This report documents what was done, and its limitations. It should be noted that increasing the length of the beam spill is only possible if the source can produce more beam per pulse than is usable by the experimenter. Experimenters running at full intensity with a short flattop (1.5 seconds) cannot benefit from a longer flattop. This paper describe the changes that have been made to Bevalac systems to make the long flattop possible, the limits put on the length of the flattop by existing hardware, and the procedure for tuning for the long flattop.

26972 (LBL–33664) **The development of colliders.** Sessler, A.M. Lawrence Berkeley Lab., CA (United States). Feb 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930293–2: International symposium on 30 years of neutral currents, Los Angeles, CA (United States), 3-5 Feb 1993). Order Number DE93013907. Source: OSTI; NTIS; INIS; GPO Dep.

Don Kerst, Gersh Budker, and Bruno Touschek were the individuals, and the motivating force, which brought about the development of colliders, while the laboratories at which it happened were Stanford, MURA, the Cambridge Electron Accelerator, Orsay, Frascati, CERN, and Novosibirsk. These laboratories supported, during many years, this rather speculative activity. Of course, many hundreds of physicists contributed to the development of colliders but the men who started it, set it in the right direction, and forcefully made it happen, were Don, Gersh, and Bruno. Don was instrumental in the development of proton-proton colliders, while Bruno and Gersh spearheaded the development of electron-positron colliders. In this brief review of the history, I will sketch the development of the concepts, the experiments, and the technological developments which made possible the development of colliders. It may look as if the emphasis is on theoretical concepts, but that is really not the case, for in this field – the physics of beams – the theory and experiment go hand in hand; theoretical understanding and advances are almost always motivated by the need to explain experimental results or the desire to construct better experimental devices.

26973 (SLAC-PUB–6097) **Chemical approaches to zero blowdown operation (TP93-05).** Geiger, G.E. (Betz Industrial, Trevose, PA (United States)); Ogg, J.; Hatch, M.R. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9302124–1: 1993 Cooling Tower Institute annual meeting, New Orleans, LA (United States), 17-19 Feb 1993). Order Number DE93015252. Source: OSTI; NTIS; INIS; GPO Dep.

Zero blowdown operation was evaluated at a cooling tower at the Stanford Linear Accelerator Center in an attempt to eliminate cooling water discharge. Testing was performed with and without acid feed for pH control using a state-of-the-art treatment which contained polymer, phosphonate, and azole. Supplemental additional of a proprietary calcium carbonate scale inhibitor was also evaluated.

26974 (SSCL-Preprint–207) **The Superconducting Super Collider: A status report.** Schwitters, R.F. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–56: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014062. Source: OSTI; NTIS; INIS; GPO Dep.

The design of the Superconducting Super Collider (SSC) is briefly reviewed, including its key machine parameters. The scientific objectives are twofold: (1) investigation of high-mass, low-rate, rare phenomena beyond the standard model; and (2) investigation of processes within the domain of the standard model. Machine luminosity, a key parameter, is a function of beam brightness and current, and it must be preserved through the injector chain. Features of the various injectors are discussed. The superconducting magnet system is reviewed in terms of model magnet performance, including the highly successful Accelerator System String Test Various magnet design modifications are noted, reflecting minor changes in the collider arcs and improved installation procedures. The paper concludes with construction scenarios and priority issues for ensuring the earliest collider commissioning.

26975 (SSCL-Preprint–217) **Business opportunities in the SSCL Global Control System.** Heefner, J.; Bork, R.; Gurd, D. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–9: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93012302. Source: OSTI; NTIS; INIS; GPO Dep.

The SSC consists of a series of six accelerators: an injector complex made up of a LINAC, a Low Energy Booster (LEB), a Medium Energy Booster (MEB), and High Energy Booster (HEB), as well as two storage rings together known as the "Collider." Although controls requirements and issues related to this complex of accelerators are not inherently different from those of other large accelerator laboratories, some special problems result from the large number of control points involved (greater than 500,000), the great distances between the various components (up to 100 Km), and the very high reliability required (.986 availability for the global control system). The SSCL will employ an integrated control system, which at the highest level is called the Global Accelerator Control System (GACS). The GACS is defined as that system which provides the infrastructure and environment in which all systems directly affecting the accelerated beam are integrated, operated and controlled. The GACS is divided into two primary subsystems, Beam Controls and Process Controls. Beam Controls are those required to operate systems which directly support beam acceleration, steering, focusing and diagnostics. The precisely timed and synchronized, high speed, high quality Beam Controls are required only during beam operations. In contrast, the Process Controls operate independently, update at slower and do not require precise timing or synchronization.

26976 (SSCL-Preprint–253) **What the quality philosophy brings to a research and development environment like the SSC.** Davis, S.; Wentz, J. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–12: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014079. Source: OSTI; NTIS; INIS; GPO Dep.

In achieving major schedule and performance milestones with a project as technologically advanced as the Superconducting Super Collider, many activities must be coordinated simultaneously without the luxury of a conventional design review process. Because the design may change several times prior to the delivery of a one-of-a-kind or prototype component or subsystem, close verification and monitoring of design, manufacturing and test processes are needed on a real-time basis. This verification and monitoring is performed on two levels by Quality Assurance at the SSC Laboratory; Division and General Management. The Division level is involved in day-today activities at the Laboratory and the Suppliers; the General Management level performs the independent oversight function for all the Laboratory quality processes. In the divisions, continuous monitoring of design, procurement, manufacturing, installation, and testing activities is performed. At the General Management level, quality program development and implementation is evaluated within each division. Critical suppliers involved in system design, manufacturing, and testing are evaluated against contract and program requirements to assure systems safely perform their

intended functions. Responsibilities for quality are extended by the participation of the SSCL Quality Assurance Office in Accelerator Readiness Reviews (ARR) previously known as Operational Readiness Reviews (ORR) for each major machine developed and designed at the Laboratory. Quality Assurance promoted continuous awareness of DOE contract requirements, SSC Laboratory Quality Assurance requirements and the Safety Analysis Report requirements which is not an easy task in the scientific community. A result has been a new cooperative attitude in which physicists, scientists, engineers, safety and quality professionals can work together towards a common goal.

26977 (SSCL-Preprint–343) **Status of the SSC.** Johnson, D.E. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE93016184. Source: OSTI; NTIS; INIS; GPO Dep.

The Superconducting Super Collider (SSC) is a high-luminosity proton-proton colliding-beam accelerator, providing access to particle collision energies at least an order of magnitude greater than are available at existing facilities. The SSC will have a maximum energy of 40 TeV in the center-of-mass and a luminosity of $10^{33}cm^{-2}s^{-1}$ when completed. This paper will describe the current status of the design and construction of the SSC.

26978 (SSCL-Preprint–370) **The effect of global survey misalignment on the SSC.** Garavaglia, T.; Mahale, N.; Peterson, J. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–35: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014178. Source: OSTI; NTIS; INIS; GPO Dep.

Survey errors in the global alignment of the SSC can affect its performance. These errors can result in an uncertainty in the circumference of the collider, and this can produce a mismatch in the transfer of bunches from the HEB to the SSC. An uncertainty in the half-circumference of the Collider will reduce the luminosity. To estimate this effect, an expression is given for the luminosity as a function of crossing angle and half-circumference difference. In addition, estimates are given for closed orbit distortion, vertical dispersion, and tune shift, resulting from circumferential errors. Suggestions are made for correcting the effects resulting from global survey errors.

26979 (SSCL-Preprint–428) **Accelerator physics issues at the SSC.** Dugan, G.F. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–206: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93016246. Source: OSTI; NTIS; INIS; GPO Dep.

Realization of the design energy and luminosity goals of the Superconducting Super Collider (SSC) will require proper resolutions of a number of challenging problems in accelerator physics. The status of several salient issues in the design of the SSC will be reviewed and updated in this paper. The emphasis will be on the superconducting accelerators.

26980 (ANL/ASD/CP–78288) **Required cavity HOM deQing calculated from probability estimates of coupled bunch instabilities in the APS ring.** Emery, L. Argonne National Lab., IL (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930511–147: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015164. Source: OSTI; NTIS; INIS; GPO Dep.

A method of determining the deQing requirement of individual cavity higher-order modes (HOM) for a multi-cavity RF system is presented and applied to the APS ring. Since HOM resonator frequency values are to some degree uncertain, the HOM frequencies should be regarded as random variables in predicting the stability of the coupled bunch beam modes. A Monte Carlo simulation provides a histogram of the growth rates from which one obtains an estimate of the probability of instability. The damping of each HOM type is determined such that the damping effort is economized, i.e. no single HOM dominates the specified growth rate histogram.

26981 (ANL/ASD/CP–78298) **Establishment of a tolerance budget for the Advanced Photon Source storage ring.** Bizek, H.; Crosbie, E.; Lessner, E.; Teng, L. Argonne National Lab., IL (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930511–148: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015165. Source: OSTI; NTIS; INIS; GPO Dep.

The limitations on the dynamic aperture of the Advanced Photon Source storage ring due to magnet misalignments and fabrication errors are presented. The reduction of the dynamic aperture is analyzed first for each error considered individually, and then for combined error multipole fields in dipole, quadrupole, and sextupole magnets, excluding and including magnet misalignments. Since misalignments of the strong quadrupoles in the ring induce large orbit distortions, the effects on the dynamic aperture are investigated before and after orbit correction. Effects of off-momentum particles and the tune dependence with momentum are also presented. This extensive analysis leads to the establishment of a tolerance budget. With all the errors set at the tolerance level and with the orbit distortions corrected, the dynamic aperture reduction is no greater than 50% of that of the ideal machine.

26982 (BNL–48233) **A new formulation of longitudinal coherent instabilities.** Zhang, S.Y.; Weng, W.T. Brookhaven National Lab., Upton, NY (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–127: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014288. Source: OSTI; NTIS; INIS; GPO Dep.

The quadrature response of longitudinal impedance is shown to be the effective impedance for the beam instability. The results of the application of this formulation are compared with that obtained using the Robinson-Pedersen approach and the Sacherer integral equation. The formulation is further generalized to the rigid bunch motion using signal analysis method, where a form factor shows up naturally. Finally, the formulation is applied to solve the coupled bunch instabilities. Examples of the AGS Booster and the AGS coupled bunch instabilities are used to illustrate the applications of the formulation.

26983 (BNL–48235) **Wiggler as spin rotators for RHIC.** Luccio, A.; Conte, M. Brookhaven National Lab., Upton, NY (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–74: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014312. Source: OSTI; NTIS; INIS; GPO Dep.

The spin of a polarized particle in a circular accelerator can be rotated with an arrangement of dipoles with field mutually perpendicular and perpendicular to the orbit. To achieve spin rotation, a given field integral value is required. The device must be designed in a way that the particle orbit is distorted as little as possible. It is shown that wigglers with many periods are suitable to achieve spin rotation with minimum orbit distortions. Wigglers are also more compact than more established structures and will use less electric power. Additional advantages include their use for non distructive beam diagnostics. Results are given for the Relativistic Heavy Ion Collider (RHIC) in the polarized proton mode.

26984 (BNL–48237) **Measurement of the spin of a particle using undulator radiation.** Luccio, A. Brookhaven National Lab., Upton, NY (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–75: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014334. Source: OSTI; NTIS; INIS; GPO Dep.

Use of many period wigglers to rotate the spin of particles in accelerators has been proposed. An added advantage of this scheme is that a spectrum of synchrotron radiation will be produced that contains a contribution due to the spin, so that the device can be effectively used as spin polarimeter, with advantages compared to Compton backscattering methods. Results are presented for two high energy proton storage rings: RHIC and the SSC.

26985 (BNL–48239) **Time domain solutions for a coasting beam with impedance feedback.** Blaskiewicz, M. Brookhaven National Lab., Upton, NY (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–125: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014296. Source: OSTI; NTIS; INIS; GPO Dep.

Time domain solutions for a coasting beam interacting with a longitudinal or transverse impedance are presented. The treatment is limited to first order perturbation theory, but it includes Landau damping.

26986 (BNL–48240) **Longitudinal impedance and stability thresholds of the AGS Booster.** Blaskiewicz, M. Brookhaven National Lab., Upton, NY (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–159: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015407. Source: OSTI; NTIS; INIS; GPO Dep.

The various sources of longitudinal impedance in the AGS Booster are identified and the effects of the total impedance are estimated. In particular, the parasitic effects of the rf cavities during proton acceleration are explored. Dynamics are treated using a first order Vlasov analysis in the weak synchrotron coupling approximation.

26987 (BNL–48373) **Confinement and stability of a Crystal Beam.** Ruggiero, A.G. Brookhaven National Lab., Upton, NY (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–152: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015400. Source: OSTI; NTIS; INIS; GPO Dep.

The following is an analysis of the confinement and stability issues of a Crystal Beam. A method is described to determine the equilibrium configuration of a beam of highly charged particles. It is required that the beam has a uniform distribution in the direction of motion, which is stable and does not need therefore confinement with external means. It is shown that this can be obtained only for a relatively longitudinally compact beam. Confinement in the plane transverse to the direction of motion is obtained with external means, which also provide stability. It is important that particles are distributed so that the resulting space charge forces are linear with respect to the particle transverse coordinates.

26988 (BNL–48374) **Nuclear fusion of protons with ions of boron.** Ruggiero, A.G. Brookhaven National Lab., Upton, NY (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–124: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014284. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes a method of extracting energy from the fusion events occurring between the collision of a beam of protons with a beam of ions of Boron 11. The two beams are circulating in separated and intersecting storage rings where they collide beadon in a common long-straight section. Requirements on the luminosity of the low-energy collider are shown. Limitations due to space-charge and intrabeam scattering are described. Very fast electron cooling is needed to compensate these effects.

26989 (BNL–48375) **Broadband impedance of azimuthally symmetric devices in RHIC.** Mane, V. Brookhaven National Lab., Upton, NY (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–72: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014329. Source: OSTI; NTIS; INIS; GPO Dep.

The interaction between the beam and its environment leads to beam instabilities, and is characterized by coupling impedance. The longitudinal coupling impedance of some RHIC devices with azimuthal symmetry such as bellows, pipe transition, gate valve and collimator have been calculated numerically using the time domain code TBCI. The objective is to keep the broadband impedance below a threshold so that it satisfies the microwave stability criteria; and make sure there is no contribution to narrowband impedance from any of these structures.

26990 (BNL–48386) **Comparison of aperture determinations on RHIC for single particles tracked 10^6 turns and 100 particles, having randomly generated initial coordinates, tracked for 1000 turns.** Dell, G.F. Brookhaven National Lab., Upton, NY (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–155: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015401. Source: OSTI; NTIS; INIS; GPO Dep.

Aperture determinations from 100 particles tracked for 1000 turns using randomly selected initial coordinates are compared with results from 10^6 turn runs when initial coordinates are defined by $\epsilon_x = \epsilon_y$ and $X_i' = Y_i' = 0$. Measurements were made with ten distributions of magnetic field errors. The results from tracking 100 particles for 10^3 turns are equivalent to those from 10^6 turn runs, have a distribution of considerably less width, and require only one tenth the computer time.

26991 (BNL–48388) **Software development with two port calibration techniques for RHIC impedance measurements.** Mane, V.; Shea, T. Brookhaven National Lab., Upton, NY (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–73: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014328. Source: OSTI; NTIS; INIS; GPO Dep.

The coupling impedance of accelerator devices is measured by simulating the beam with a central wire and measuring the scattering parameters of the system. The wire pipe system forms a mismatch with the 50 ohm transmission line. An integrated software environment has been developed in LabVIEW, for the Macintosh. The program measures the scattering parameters of some known standards, determines the connect scattering parameters of a device using TRL calibration technique and gives the impedance of the device. Its performance has been tested for some known microwave devices.

26992 (BNL–48894) **A γ_t-jump scheme for the Brookhaven AGS.** Ahrens, L.; Auerbach, E.; Hardt, W.; Raka, E.; Ratner, L.; Yamin, P. Brookhaven National Lab., Upton, NY (United States). 23 Apr 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93014301. Source: OSTI; NTIS; INIS; GPO Dep.

Accelerator Division technical note No. 265.

AGS beam losses at transition are now tolerable (<5%), but as the present improvement plans are implemented and the intensity is increased, new mechanisms will become important and the losses will increase. This Note describes studies directed towards minimizing these losses. Werner Hardt has studied these losses at the CERN PS. In particular, he found that by sharply reducing the time spent going through transition he could reduce the losses. Hardt visited Brookhaven in early June, 1986, in order to help us better understand the AGS. As a result of work inspired by his visit, we now believe that intensities of $\sim 5 \times 10^{13}$ circulating protons are attainable in the AGS without significant losses at transition.

26993 (BNL–48958) **Wake-field and space charge effects on high brightness beams calculations and measured results for the laser driven photoelectrons at BNL-ATF.** Parsa, Z. Brookhaven National Lab., Upton, NY (United States). May 1993. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CAP–95-ATF-93C;CONF-9109349–2: Accelerator physics and modeling, Upton, NY (United States), 17 Sep 1991). Order Number DE93015787. Source: OSTI; NTIS; INIS; GPO Dep.

We discuss the formalism used to study the effects of the interactions between the highly charged particles and the fields in the accelerating structure, including space charge and wake fields. Some of our calculations and numerical simulation results obtained for the Brookhaven National Laboratory (BNL) high-brightness photoelectron beam at the Accelerator Test Facility (ATF) and the measured data at ATF are also included.

26994 (CEA-LNS-GT–92-09) **Numerical simulation of spin motion in circular accelerators using spinor formulation.** Nghiem, P.; Tkatchenko, A. Laboratoire National Saturne - Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Jul 1992. [31p.] Order Number DE93631091. Source: OSTI; NTIS (US Sales Only); INIS.

A simple method is presented based on spinor algebra formalism for tracking the spin motion in circular accelerators. Using an analytical expression of the one-turn transformation matrix including the effects of perturbating fields or of siberian snakes, a simple and very fast numerical code has been written for studying spin motion in various circumstances. In particular, effects of synchrotron oscillations on final polarization after one isolated resonance crossing are simulated. Results of these calculations agree very well with those which have been obtained previously from analytical approaches or from other numerical-simulation programs. (author) 8 refs.; 14 figs.

26995 (CEA-LNS-GT-ME–92-08) **Spreader and recombiner for 15-30 GeV electron accelerator.** Doornbos, J. Laboratoire National Saturne - Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Mar 1992. [20p.] Order Number DE93631090. Source: OSTI; NTIS (US Sales Only); INIS.

The spreader and the recombiner systems for a linear accelerator are described in detail. The beams in the spreader and recombiner have to be matched on one side to the beams in the linac and on the other to the beams in the arcs. The beam forming system and the optical arrangement of the spreader and recombiner is described, and beam dynamical calculations are presented. (K.A.) 16 figs.

26996 (DOE/ER/40374–72) **Research in accelerator physics (Theory): Final technical report, May 15, 1992–May 14, 1993.** Ohnuma, S. Houston Univ., TX (United States). 10 Jun 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER40374. Order Number DE93014765. Source: OSTI; NTIS; INIS; GPO Dep.

Work during the period November 1, 1992 through May 14, 1993 emphasized the following topics: final test of HESQ as a transport element at the SSC, analytical studies of Taylor maps for symplectic systems, and physics of magnet sorting in large rings. Earlier work has already been reported.

26997 (DOE/ER/40747–2) **Minimizing linear coupling in AGS with skew quads.** Huang, H. (Indiana Univ., Bloomington, IN (United States). Dept. of Physics); Lee, S.Y.; Ratner, L.G. Indiana Univ., Bloomington, IN (United States). Dept. of Physics. [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER40747. Order Number DE93017206. Source: OSTI; NTIS; INIS; GPO Dep.

Skew quadrupoles and solenoids can introduce linear betatron coupling into the beam. Since the linear coupling causes emittance growth, it should be minimized. Linear coupling caused by a solenoid can be corrected with skew quadrupoles by minimizing the coupling coefficient. It requires two orthogonal skew quadrupole families. The major source of linear coupling arises from the 5% partial solenoidal snake to be installed in the section I10 of the AGS. To correct the effect of linear coupling, 4 families of skew quadrupoles are proposed. 3 figs.

26998 (ENEA-RT-INN–92-31) **Analysis of optical-Klystron gain depression induced by inhomogeneous broadening effects.** Ciocci, F.; Dattoli, G.; Giannessi, L.; Torre, A. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Dec 1992. 21p. (RT/INN–92-31). Order Number DE93799302. Source: OSTI; NTIS (US Sales Only); INIS.

Optical-Klystron (O.K.) configuration have been successfully exploited to enhance the gain of free electron lasers operating with storage rings. With the aim of presenting simple formulae which may be helpful in designing an actual O.K., this paper analyzes the modification induced in the Optical- Klystron gain by an e-beam with non-negligible energy spread and emittances. The analysis is carried out including the inhomogeneous broadening contributions due to the undulators and dispersive parts. The paper deals essentially with the low gain regime. The corrections due to the high gain effects are also discussed.

26999 (ETDE-IT–93-194) **High gain optical klystron.** Dattoli, G.; Galli, M.; Ottaviani, P.L.; Torre, A. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. 1992. 19p. Order Number DE93799299. Source: OSTI; NTIS (US Sales Only); INIS.

This paper analyzes the high-gain optical klystron regime, and discusses the conditions under which deviations occur from the linear theory. It shows that scaling relations, of the same type exploited for the conventional FEL (free electron laser) gain, hold for optical-klystron devices. It also explores problems related to inhomogeneous broadening gain reduction and finds that, analogous to conventional FEL's, the high gain corrections to optical-klystron operation are more severely reduced than the linear contributions.

27000 (FNAL/C–93/119) **Transition crossing in the Fermilab Main Ring, past and present.** Kourbanis, I.; Ng, K.Y. Fermi National Accelerator Lab., Batavia, IL (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-930511–140: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014923. Source: OSTI; NTIS; INIS; GPO Dep.

A recent installation of passive mode dampers in the Booster has eliminated most of the longitudinal emittance blowup of intense bunches due to coupled-bunch instabilities. As a result, high intensity effects (negative-mass instability) dominate the present transition crossing in the Main Ring for the high-intensity cycles. A negative-mass stability limit is derived for transition crossing in the Main Ring and recent observations of high frequency signals around transition is presented. Finally, some predictions about the effect of the negative mass instability on the transition in the Main Ring with the future upgrades are attempted.

27001 (FNAL/C–93/126) **Observation of the coalescing of beam into an asymmetric rf bucket by stochastic cooling.** Halling, A.M.; Lu, Xian Ping. Fermi National Accelerator Lab., Batavia, IL (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-930511–135: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015133. Source: OSTI; NTIS; INIS; GPO Dep.

Antiprotons in the debuncher ring at Fermilab have been observed to be bunched outside of the "barrier bucket" when cooled to small $\Delta p/p$ with the stochastic cooling. This bunching occurs in the same location as a very small stable bucket in the RF wave form. The stochastic cooling appears to be causing beam that is originally uniformly distributed to be captured by this stable bucket.

27002 (FNAL/C–93/130) **The appearance of beam lines.** Carey, D.C. Fermi National Accelerator Lab., Batavia, IL (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-930511–162: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015533. Source: OSTI; NTIS; INIS; GPO Dep.

The combination of an existing graphics package with a large program like TRANSPORT has often resulted in considerable modification to the large program. Use of other graphics package has resulted in essentially having to repeat the work. This difficulty has been avoided in a modification of TRANSPORT which produce layouts of beam lines. Drawings of the reference trajectory and three-dimensional images of all magnets are made by the graphics package TOP DRAWER. Nothing specific to TOP DRAWER or any other graphics has been incorporated into TRANSPORT. If a user is with a different graphics package he or she can then begin usage of this alternate package essentially immediately.

27003 (FNAL/C–93/135) **Automatic differentiation of limit functions.** Michelotti, L. Fermi National Accelerator Lab., Batavia, IL (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-930511–209: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93016376. Source: OSTI; NTIS; INIS; GPO Dep.

Automatic differentiation can be used to evaluate the derivatives of and set up Taylor series for implicitly defined functions and maps. The author provides several examples of how this works, within the context of the MXYZPTLK class library, and discusses its extension to inverse functions. The techniques of automatic differentiation and differential algebra are rapidly becoming a standard part of accelerator physicists' arsenals.

27004 (GANIL-P–92-28) **Secondary beams at GANIL.** Doubre, H. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)). Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1992. [14p.] Order Number DE93631092. Source: OSTI; NTIS (US Sales Only); INIS.

GANIL, a user's facility since 1983, can deliver a broad spectrum of heavy-ion beams, from He to U, to well-equipped experimental areas. Their very large intensities are to be exploited to produce secondary beams, either using the fragmentation method (beams at energy per nucleon larger than 30 MeV/u), or the ISOL method. With the latter one, these ions have to be re-accelerated. The project of a cyclotron as a post-accelerator is described. (author) 11 refs.; 7 figs.; 3 tabs.

27005 (IFVE-OKU–92-94) **Particle bunch forming in IHEP PS for UNK colliding beams.** Myaeh, Eh.A.; Nelipovich, E.S.; Pashkov, P.T.; Smirnov, A.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. [12p.] (In Russian). Order Number DE93628250. Source: OSTI; NTIS (US Sales Only); INIS.

A possibility to form in the IHEP machine the particle bunches whose longitudinal parameters would satisfy (0.4x3) TeV p-p program is analyzed. The compensation method of the RF voltage induced on the accelerating cavities when stretching the beam is suggested. The second and the fourth RF harmonics are used to extend the linearity domain of the accelerating field and, in consequence, to diminish bunch distortions during the subsequent compression process. The main parameters of the RF system needed for the creation the RF harmonics in the IHEP PS have been calculated as well. 6 refs.; 2 figs.; 1 tab.

27006 (IFVE-OUNK–91-141) **Bunch compression in the U-70 prior to beam extraction to provide UNK operation in beam colliding mode.** Balbekov, V.I.; Malovitskij, A.Yu. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1991. [15p.] (In Russian). Order Number DE93629613. Source: OSTI; NTIS (US Sales Only); INIS.

Bunch compression technique is considered which is supposed to be done before the beam transfer from the U-70 to be UNK. The latter is supposed to operate in the (0.4x3) TeV beam colliding mode. The technique includes the mismatching of the beam prior to its rotation in phase space around the stable fixed point. In addition to microwave instability two main problems are treated in detail - the nonlinearity of the synchrotron motion and the interaction of the beam with the RF cavities during the compression. Possible cures are investigated such as using an harmonic cavity at double of the RF frequency in order to linearise the main voltage. Also the suppression of the 1-st harmonic of the beam current is shown to be necessary for successful compression of the bunch. The influence of higher-order harmonic of the induced voltage is evaluated. 6 refs.; 9 figs.; 2 tabs.

27007 (IFVE-OUNK–91-158) **Beam-chamber interaction in accelerators. Methods for calculating coupling impedances.** Kurennoj, S.S. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1991. [63p.] (In Russian). Order Number DE93629614. Source: OSTI; NTIS (US Sales Only); INIS.

A review of methods for calculating the coupling impedances of the vacuum chamber of accelerators is given. The definitions of the coupling impedances, their properties and relations to the wake potentials are discussed in detail. The main attention is paid to the techniques applied at low frequencies and in the resonant region. An attempt to classify these methods is made. The paper presents a collection of formulae and can be used as a reference guide. 126 refs.; 1 fig.; 1 tab.

27008 (IFVE-OUNK–92-69) **Magnetic field quality in the pilot industrial batch's SC dipoles for the UNK.** Bal'bekov, V.I. (and others); Gertsev, K.F.; Zlobin, A.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. [15p.] (In Russian). Order Number DE93628251. Source: OSTI; NTIS (US Sales Only); INIS.

Now the pilot industrial batch of superconducting magnets is being manufactured at IHEP. The magnetic measurements of 25 dipoles have been performed. This paper contains the measured characteristics of the field quality: systematic and r.m.s. values of nonlinearities and field integral as functions of the supply current. The defects of these field errors on betatron tune spread and an increase of beam emittances are determined. The features of the UNK correction systems for this magnetic field quality are analyzed. 13 refs.; 5 tabs.

27009 (JAERI-M–92-211) **Properties of the transfer matrices of deflecting magnet systems for free electron laser.** Takao, Masaru (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1993. 17p. (In Japanese). Order Number DE93508257. Source: OSTI; NTIS; INIS.

The oscillation of the free electron laser (FEL) requires the high current and low emittance electron beam. The beam transport system should be achromatic and isochronous to preserve the brightness and the emittance of the electron beam. In this paper we clarify the algebraic properties of the transfer matrices of the magnetic deflection system, which is a key component in the beam transport line. (author).

27010 (JINR-E–9-92-227) **Eigenpotentials of self-consistent cylindrical Brillouin relativistic electron beam (REB).** Matora, I.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1992. [10p.] Order Number DE93629615. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nucl. Instrum. Methods.

The calcualtion results are given of the vector and scalar eigenpotentials in the self-consistent, high-current, cylindrical Brillouin REB and of its other radius dependent parameters. In combination with well-known earlier results on other dependences and constant values in these REB's and with the exact relativistic equation for electron trajectories in axisymmetrical laminar REB's, the data of this work could be applied to exact calculations of self-consistent cylindrical Brillouin REB formation. 4 refs.; 1 tab.

27011 (LA-UR–93-1686) **Beam halo in high-intensity beams.** Wangler, T.P. Los Alamos National Lab., NM (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930269–14: Computational accelerator physics conference (CAP93), Pleasanton, CA (United States), 22-26 Feb 1993). Order Number DE93014565. Source: OSTI; NTIS; INIS; GPO Dep.

In space-charge dominated beams the nonlinear space-charge forces produce a filamentation pattern, which in projection to the 2-D phase spaces results in a 2-component beam consisting of an inner core and a diffuse outer halo. The beam-halo is of concern for a next generation of cw, high-power proton linacs that could be applied to intense neutron generators for nuclear materials processing. The author describes what has been learned about beam halo and the evolution of space-charge dominated beams using numerical simulations of initial laminar beams in uniform linear focusing channels. Initial results are presented from a study of beam entropy for an intense space-charge dominated beam.

27012 (LA-UR–93-1816) **Design for low beam loss in accelerators for intense neutron source applications.** Jameson, R.A.

Los Alamos National Lab., NM (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States); Japan Atomic Energy Research Inst., Tokyo (Japan). DOE Contract W-7405-ENG-36. (CONF-930511–82: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014557. Source: OSTI; NTIS; INIS; GPO Dep.

Control of beam loss in intense ion linacs involves keeping beam spill below parts in 10^{-5}–10^{-8}/m by preventing total beam size from extending to the limiting apertures. Starting from good rms design practices, new analysis of the machine architecture is described in terms of the effects of the machine tune with space-charge, free-energy constraint, and halo-producing mechanisms. It is shown that halos are produced by the time- (or position-) varying nature of common linac aspects (such as misalignment, mismatching, acceleration, and construction techniques) through collective core/single-particle interaction dynamics plus resonances.

27013 (LA-UR–93-1919) **Beam halo formation from space-charge dominated beams in uniform focusing channels.** O'Connell, J.S. (Booz, Allen and Hamilton, Inc., Arlington, VA (United States)); Wangler, T.P.; Mills, R.S.; Crandall, K.R. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–49: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014458. Source: OSTI; NTIS; INIS; GPO Dep.

In space-charge dominated beams the nonlinear space-charge forces produce a filamentation pattern, which results in a 2-component beam consisting of an inner core and an outer halo. The halo is very prominent in mismatched beams, and the potential for accelerator activation is of concern for a next generation of cw, high-power proton linacs that could be applied for intense neutron generators to process nuclear materials. We present new results about beam halo and the evolution of space-charge dominated beams from multiparticle simulation of initial laminar beams in a uniform linear focusing channel, and from a model consisting of single particle interactions with a uniform-density beam core. We study the energy gain from particle interactions with the space-charge field of the core, and we identify the resonant characteristic of this interaction as the basic cause of the separation of the beam into the two components. We identify three different particle-trajectory types, and we suggest that one of these types may lead to continuous halo growth, even after the halo is removed by collimators.

27014 (LBL–32435-Draft) **Closed orbit distortion and the beam-beam interaction.** Furman, M. (Lawrence Berkeley Lab., CA (United States)); Chin, Y.H.; Eden, J.; Kozanecki, W.; Tennyson, J.; Ziemann, V. Lawrence Berkeley Lab., CA (United States). 1 Jun 1992. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (ESG–193;SLAC-ABC–49). Order Number DE93015284. Source: OSTI; NTIS; INIS; GPO Dep.

We study the applicability of beam-beam deflection techniques as a tuning tool for the SLAC/LBL/LLNL B factory, PEP-II. Assuming that the closed orbits of the two beams are separated vertically at the interaction point by a local orbit bump that is nominally closed, we calculate the residual beam orbit distortions due to the beam-beam interaction. Difference orbit measurements, performed at points conveniently distant from the IP, provide distinct coordinate- or frequency-space signatures that can be used to maintain the beams in collision and perform detailed optical diagnostics at the IP. A proposal to test this method experimentally at the TRISTAN ring is briefly discussed.

27015 (LBL–33091) **User's guide for New ABCI version 6.2: Azimuthal Beam Cavity Interaction.** Chin, Yong Ho. Lawrence Berkeley Lab., CA (United States). Nov 1992. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CERN-SL–92-49(AP);ESG–216). Order Number DE93015294. Source: OSTI; NTIS; INIS; GPO Dep.

ABCI described here is a computer program which solves the Maxwell equations directly in the time domain when a Gaussian beam goes through an axi-symmetrical structure on or off axis. Many new features have been implemented in this version of ABCI, including the "moving mesh" and Napoly's method of calculation of wake potentials. The mesh is now generated only for the part of the structure inside a window, and moves together with the window frame. This moving mesh option drastically reduces the number of mesh points, and therefore allows calculation of wake potentials in very long structures and/or for very short bunches. In terms of Napoly's integration method, the calculation of transverse and longitudinal wake potentials in a structure such as a collimator, where parts of the cavity material come down below the beam pipe radius, can be carried out now correctly with beam pipes of short length at both ends. For the monopole wake potential, ABCI can be applied even with structures with unequal beam pipe radii. A newly installed mesh generator performs automatic circular and elliptical connections of input points just as TBCI does. In addition to the conventional method, ABCI permits the input of the structure geometry by giving the increments of coordinates from the previous positions. In this method, one can use the repetition commands to repeat input blocks when the same structure repeats many times. Plots of a cavity shape and wake potentials can be obtained in the form of a Top Drawer file. ABCI is available as a source code in the CERN IBM VM/CMS system.

27016 (SAND–93-7067C) **Beam emittance from coherent Cherenkov radiation in a solid dielectric.** Richardson, R.D. (Science Applications International Corp., Albuquerque, NM (United States)); Platt, R.C.; Crist, C.E. Sandia National Labs., Albuquerque, NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930511–158: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015022. Source: OSTI; NTIS; INIS; GPO Dep.

We report experimental insults of a technique for direct measurement of the emittance in high energy beams. This technique is analogous to the well known "pepper pot" masking approach, but with no upper limit on particle energy. Single shot emittance profiles were obtained on the 10 kA, 4 MeV SNL electron Recirculating Linear Accelerator showing agreement with theory and with alternate emittance measurements. Coherent (i.e., not strongly scattered or diffused) Cherenkov radiation from a flat, transparent, range-thin dielectric foil was split by an array of mirrors in order to view the emission profile up to a divergence angle of 70°. The mirrors were imaged by a distant telescope attached to an intensified, 2 ns video framing camera. The relative intensity profiles of the multiple images were unfolded using the properties of classical Cherenkov emission and geometric optics to obtain directly, without precise knowledge of other beam parameters, the transverse velocity distribution in the viewing plane. In our case the rms emittance was directly proportional to the product of the beam diameter and the transverse velocity spread. This and prior research efforts indicate applicability over a wide range of high energy beam parameters.

27017 (SLAC-PUB–6123) **Broadband impedance of the B factory.** Heifets, S. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Apr 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-930511–164: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015602. Source: OSTI; NTIS; INIS; GPO Dep.

The broadband impedance is described phenomenologically by expansion over $\sqrt{\omega}$. It is shown that different terms of the expansion correctly describe particular impedance-generating elements. The broadband impedance and the wake function of the B factory are reconstructed with numeric code TBCI. The losses at the interaction region due to excitation of the higher order modes (HOM) are estimated.

27018 (SSCL–614) **Simulation studies of the transverse dipole mode multibunch instability for the SSC Collider.** Chen, S.; Lopez, G. Superconducting Super Collider Lab., Dallas, TX (United States). Jan 1993. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE93016044. Source: OSTI; NTIS; INIS; GPO Dep.

A computer program that assumes a point-like structure of the bunches, called TADIMMI, has been devised to study the dipole mode multibunch instability in the Superconducting Super Collider (SSC) Collider ring due to a single Positron-Electron Project (PEP) test rf cavity and the resistive wall. For the rf cavity, the following cases are considered: symmetric filling, where good agreement is

obtained with ZAP code; nonsymmetric filling; elimination of the most dangerous mode of the cavity; De-Q of the cavity, where a damping ratio is obtained for the cavity; and the feedback system, where it is verified that the proposed system for the Collider will work. For the resistive wall, a resonator impedance model approximation is used, which allows use of the same computer program to study the instabilities and the associated feedback system. Comparison with the analytical approach (ZAP) is also made.

27019 (SSCL-Preprint–149-Rev.2) **A parallel implementation of particle tracking with space charge effects on an INTEL IPSC/860.** Chang, L.; Bourianoff, G.; Cole, B.; Machida, S. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–54-Rev.2: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014163. Source: OSTI; NTIS; INIS; GPO Dep.

Particle-tracking simulation is one of the scientific applications that is well-suited to parallel computations. At the Superconducting Super Collider, it has been theoretically and empirically demonstrated that particle tracking on a designed lattice can achieve very high parallel efficiency on a MIMD Intel iPSC/860 machine. The key to such success is the realization that the particles can be tracked independently without considering their interaction. The perfectly parallel nature of particle tracking is broken if the interaction effects between particles are included. The space charge introduces an electromagnetic force that will affect the motion of tracked particles in 3-D space. For accurate modeling of the beam dynamics with space charge effects, one needs to solve three-dimensional Maxwell field equations, usually by a particle-in-cell (PIC) algorithm. This will require each particle to communicate with its neighbor grids to compute the momentum changes at each time step. It is expected that the 3-D PIC method will degrade parallel efficiency of particle-tracking implementation on any parallel computer. In this paper, we describe an efficient scheme for implementing particle tracking with space charge effects on an INTEL iPSC/860 machine. Experimental results show that a parallel efficiency of 75% can be obtained.

27020 (SSCL-Preprint–238) **Echo effect in accelerators.** Stupakov, G.; Kauffmann, K. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–32: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014138. Source: OSTI; NTIS; INIS; GPO Dep.

The echo effect has been known for many years in different fields of physics. Examples are the spin echo in solids, photon echo in solids and gases, plasma wave echo, and the echo in a liquid with gas bubbles. The media that exhibit the echo characteristically consist of (or contain in them) an ensemble of oscillators with different eigenfrequencies and negligibly small dissipation. An initial perturbation applied to such a medium excites oscillations (or waves) that slowly damp due to dephasing. This kind of damping differs essentially from that which would result from a dissipative mechanism; in particular, dephasing does not increase the entropy of the medium. It has the remarkable feature that even after the oscillations are completely damped out, the system keeps a "recollection" about them, and a special kind of a disturbance applied to the medium can transiently restore the oscillations in the form of an echo signal. The betatron echo in a hadron accelerator can be observed in a situation where the beam is injected off-center into the ring at time $n = 0$ (n is the time measured in the number of turns), causing its centroid to undergo betatron oscillations. After these oscillations have completely damped out due to beam decoherence, the beam is excited by a quadrupole kick at time $n = n_1$. This kick does not produce any visible displacement of the beam at that time, but it turns out that close to time $n = 2n_1$, the beam centroid undergoes transient betatron oscillations with an amplitude which is a fraction of the initial beam offset.

27021 (SSCL-Preprint–367) **The provision of IP crossing angles for the SSC.** Nosochkov, Y. (Superconducting Super Collider Lab., Dallas, TX (United States)); Ritson, D. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–27: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014264. Source: OSTI; NTIS; INIS; GPO Dep.

Luminosity is to be produced at the SSC collider by crossing with finite angle the counter circulating proton beams at each interaction point (IP). Such a crossing angle introduces unwanted dispersion in the high beta triplet quadrupoles adjacent to the IPs which must be corrected out. We propose to produce variable crossing conditions at each IP with local steering dipoles adjusted to give required slopes and displacements for each IP. The anomalous dispersion introduced by these orbit displacements will be corrected in the arcs (dispersive region) just prior to entry and exit into the IPs with opposite polarity quadrupole pairs separated by 900 in phase, a "late" correction scheme. Such pairs cause minimal change to the betatron functions but produce dispersion that can be set to cancel the anomalous dispersion. The IR design is such that the phase advance between correctors and the IP triplet gives efficient full local anomalous dispersion cancellation. The proposed system is to be formed from standard SSC corrector elements and will provide the range of crossing conditions required for collision optics and for separating the beams at injection.

27022 (SSCL-Preprint–368) **Current design of the SSC Interaction Regions.** Nosochkov, Y. (Superconducting Super Collider Lab., Dallas, TX (United States)); Garren, A.; Sen, T.; Stiening, R.; Courant, E.; Ritson, D.M. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–131: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014262. Source: OSTI; NTIS; INIS; GPO Dep.

We review the important changes made to the optics of the Interaction Regions (IRs) in the collider since the conceptual design (SCDR) of 1990. The most significant modification is a new procedure for the β squeeze. Three additional families of independently powered quadrupoles change the optics from injection to collision while the strengths of the final focus triplet quadrupoles are held constant. The phase advance from the interaction point (IP) to the arc quadrupoles is optimized to provide more effective positions of the local correctors for the IR. Two secondary foci where the IP is imaged have been incorporated symmetrically on both sides of the IP. Other changes include a significant reduction in the β_{peak} at injection, optimized configuration of the $M = -I$ section, quadrupoles with 5 cm bore, minimized number of quad families, standard design of the vertical bends and reduced total length of the magnets. The optics allows for a wide range of values for a detector space at each IP. The time scenario for the β squeeze is considered as well.

27023 (SSCL-Preprint–369) **Decoupling schemes for the SSC Collider.** Cai, Y.; Bourianoff, G.; Cole, B.; Meinke, R.; Peterson, J.; Pilat, F.; Stampke, S.; Syphers, M.; Talman, R. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–45: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014069. Source: OSTI; NTIS; INIS; GPO Dep.

A decoupling system is designed for the SSC Collider. This system can accommodate three decoupling schemes by using 44 skew quadrupoles in the different configurations. Several decoupling schemes are studied and compared in this paper.

27024 (SSCL-Preprint–372) **Longitudinal instabilities in the MEB.** Palkovic, J.A. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–108: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014067. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper longitudinal instability parameters are calculated for the SSC Medium Energy Booster (MEB). Both single and multiple bunch instabilities are investigated. With a beam intensity of 1.0×10^{10} the longitudinal coupling impedance threshold, $|Z_{\|}(\omega)/n|$, is

found to be ~60 Ω at the injection momentum 12 GeV/c, and 12 Ω at the ejection momentum, 200 GeV/c. Coupled bunch instability growth rates are calculated for the λ/4 cavity higher order mode (HOM) spectrum.

27025 (SSCL-Preprint–391) **Emittance growth due to dipole ripple and sextupole.** Shih, H.J.; Ellison, J.A.; Syphers, M.J.; Newberger, B.S. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–202: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93016181. Source: OSTI; NTIS; INIS; GPO Dep.

Ripple in the power supplies for storage ring magnets can have adverse effects on the circulating beams: orbit distortion and emittance growth from dipole ripple, tune modulation and dynamic aperture reduction from quadrupole ripple, etc. In this paper, we study the effects of ripple in the horizontal bending field of the SSC in the presence of nonlinearity, in particular, the growth in beam emittance.

27026 (SSCL-Preprint–399) **SSC High Energy Booster resonance corrector and dynamic tune scanning simulation.** Zhang, P.; Machida, S. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–171: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93016123. Source: OSTI; NTIS; INIS; GPO Dep.

A resonance correction system for the High Energy Booster (HEB) of the Superconducting Super Collider (SSCL) was investigated by means of dynamic multiparticle tracking. In the simulation the operating tune is scanned as a function of time so that the bunch goes through a resonance. The performance of the half integer and third integer resonance correction system is demonstrated.

27027 (SSCL-Preprint–409) **Proton-proton scattering contribution to emittance growth.** Garavaglia, T. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–186: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93016090. Source: OSTI; NTIS; INIS; GPO Dep.

Proton-proton scattering contributes to the emittance growth of the SSC. A formulation is given and used to estimate the mean scattering angle, which is used to determine the contribution to SSC emittance growth resulting from elastic pp scattering. The method is based upon Lorentz invariants, and it permits the determination of the cross-section for scattering in the center of mass (c.m.) system, as well as scattering from a fixed target (f.t.). Also an example is given for the case of electromagnetic pp scattering, which results from single virtual photon exchange.

27028 (SSCL-Preprint–411) **Second order chromaticity of the interaction regions in the collider.** Sen, T.; Syphers, M. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–170: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93016109. Source: OSTI; NTIS; INIS; GPO Dep.

The collider in the SSC has large second order chromaticity (ξ_2) with the interaction regions (IRs) contributing substantially to it. We calculate the general expression for ξ_2 in a storage ring and find that it is driven by the first order chromatic beta wave. Specializing to the interaction regions, we show that ξ_2 is a minimum when the phase advance ($\Delta\mu_{IP-IP}$) between adjacent interaction points is an odd multiple of $\pi/2$ and both IRs are identical. In this case the first order chromatic beta wave is confined within the IRs. Conversely, ξ_2 is large either if $\Delta\mu_{IP-IP} = (2n + 1)\pi/2$ and the two IRs are very far from equality or if the two IRs are equal but $\Delta\mu_{IP-IP} = n\pi$.

27029 (SSCL-Preprint–412) **Effect of power supply ripple on emittance growth in the collider.** Sen, T.; Syphers, M. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–182: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93016107. Source: OSTI; NTIS; INIS; GPO Dep.

Power supply ripple at frequencies of 720 Hz and its harmonies is expected to affect the motion of particles in the collider. These ripple frequencies are nearly resonant with the betatron frequencies. To estimate the tolerable ripple levels, we have tracked particles through the complete nonlinear lattice for 10^4 turns with ripple fed from 10 different power stations and including up to 7 different ripple frequencies. We presently estimate that relative ripple amplitudes must be below the 10^8 level for there to be no significant impact on the emittance over the short term.

27030 (UCRL-JC–110203) **Beam control in the ETA-II linear induction accelerator.** Chen, Yu-Jiuan. Lawrence Livermore National Lab., CA (United States). 21 Aug 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9208109–86: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93013427. Source: OSTI; NTIS; GPO Dep.

Corkscrew beam motion is caused by chromatic aberration and misalignment of a focusing system. We have taken some measures to control the corkscrew motion on the ETA-11 induction accelerator. To minimize chromatic aberration, we have developed an energy compensation scheme which reduces energy sweep and differential phase advance within a beam pulse. To minimize the misalignment errors, we have developed a time-independent steering algorithm which minimizes the observed corkscrew amplitude averaged over the beam pulse. The steering algorithm can be used even if the monitor spacing is much greater than the system's cyclotron wavelength and the corkscrew motion caused by a given misaligned magnet is fully developed, i.e., the relative phase advance is greater than 27π.

27031 (ANL/ASD/CP–78167) **An I/O subnet for the APS control system: The BITBUS Universal Gateway.** Nawrocki, G.J.; Arnold, N.D.; Hoffberg, M.G.; Winans, J.R.; Benes, S.J. Argonne National Lab., IL (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930511–132: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015152. Source: OSTI; NTIS; GPO Dep.

The Advanced Photon Source (APS) control system is based an a distributed topology of microprocessor-based Input/Output Controllers (IOCs). Since the cost effectiveness of placing an IOC near every point where an interface to the control system is required may be prohibitive, I/O subnets implemented via message passing network protocols are utilized. For greatest flexibility, such a subnet must support connections to equipment via discrete I/O points, connections to standard interfaces such as GPIB and RS232, and be a practical network for custom-designed interfaces to intelligent equipment. This paper describes the BITBUS Universal Gateway (BUG), a device which supports the different interfaces mentioned above with a connection to a single BITBUS distributed subnet. The BUG utilizes an interchangeable set of circuit boards, which allow for a commonality among interface points, and the ability to use commercially available modules for I/O. This approach also circumvents several limitations of GPIB and RS232, which restrict their use in industrial electrically harsh environments, via an implementation of the BITBUS protocol over optical fibers.

27032 (ANL/ASD/CP–78290) **Abort interlock diagnostic for protection of APS vacuum chamber.** Decker, G. Argonne National Lab., IL (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38.

(CONF-930511–137: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015151. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Photon Source (APS) vacuum system has been designed to be passively safe from bending magnet radiation heating at positron beam currents up to 30 mA. Above this value, certain components may be damaged from vertical beam missteering, although work is proceeding to raise the safe current threshold. Because of this, a system for preventing the misalignment of high power density beams is required. This report details a system for protection from dipole radiation only. Work on a system for ID radiation is continuing.

27033 (ANL/ASD/CP–78299) **Optimal magnet sorting procedure and application to the APS injector synchrotron.** Koul, R.K.; Lopez, F.; Mills, F.E. Argonne National Lab., IL (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930511–149: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015166. Source: OSTI; NTIS; INIS; GPO Dep.

A magnet sorting procedure for accelerators is developed. It is implemented in two steps. The first step is completely analytical in character while the second step involves the comparison of computed values with the measured error values. The method has been implemented for sorting the Advanced Photon source (APS) injector synchrotron dipoles and quadrupoles with excellent results.

27034 (ANL/ASD/CP–78347) **A 2-Megawatt load for testing high voltage dc power supplies.** Horan, D.; Kustom, R.; Ferguson, M.; Primdahl, K. Argonne National Lab., IL (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930511–134: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015141. Source: OSTI; NTIS; GPO Dep.

A high power water-cooled resistive load, capable of dissipating 2 Megawatts at 95 kilovolts is being designed and built. The load utilizes wirewound resistor elements suspended inside insulating tubing contained within a pressure vessel which is supplied a continuous flow of deionized water for coolant. A sub-system of the load is composed of non-inductive resistor elements in an oil tank. Power tests conducted on various resistor types indicate that dissipation levels as high as 22 times the rated dissipation in air can be achieved when the resistors are placed in a turbulent water flow of at least 15 gallons per minute. Using this data, the load w.as designed using 100 resistor elements in a series arrangement A single-wall 316 stainless steel pressure vessel with flanged torispherical heads is built to contain the resistor assembly and deionized water. The resistors are suspended within G-11 tubing which span the cylindrical length of the vessel. These tubes are supported by G-10 baffles which also increase convection from the tubes by promoting turbulence within the surrounding water.

27035 (ANL/ASD/CP–78370) **Status and design of the Advanced Photon Source control system.** McDowell, W.; Knott, M.; Lenkszus, F.; Kraimer, M.; Arnold, N.; Daly, R. Argonne National Lab., IL (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930511–146: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015148. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the current status of the Advanced Photon Source (APS) control system. It will discuss the design decisions which led us to use industrial standards and collaborations with other laboratories to develop the APS control system. The system uses high performance graphic workstations and the X-windows Graphical User Interface (GUI) at the operator interface level. It connects to VME/VXI-based microprocessors at the field level using TCP/IP protocols over high performance networks. This strategy assures the flexibility and expansibility of the control system. A defined interface between the system components will allow the system to evolve with the direct addition of future, improved equipment and new capabilities.

27036 (ANL/ASD/CP–78371) **Beam position monitor data acquisition for the Advanced Photon Source.** Lenkszus, F.R.; Kahana, E.; Votaw, A.J.; Decker, G.A.; Chung, Y.; Ciarlette, D.J.; Laird, R.J. Argonne National Lab., IL (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930511–145: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015149. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the Beam Position Monitor (BPM) data acquisition scheme for the Advanced Photon Source (APS) storage ring. The storage ring contains 360 beam position monitors distributed around its 1104-meter circumference. The beam position monitor data acquisition system is capable of making turn-by-turn measurements of all BPMs simultaneously. It is VXI-based with each VXI crate containing the electronics for 9 BPMS. The VXI Local Bus is used to provide sustained data transfer rates of up to 13 mega-transfers per second to a scanner module. The system provides single-bunch tracking, bunch-to-bunch measurements, fast digital-averaged positions, beam position history buffering, and synchronized multi-turn measurements. Data is accessible to the control system VME crates via an MXI bus. Dedicated high-speed ports are provided to supply position data to beam orbit feedback systems.

27037 (ANL/PHY/CP–79517) **Experiments using the Argonne Fragment Mass Analyzer.** Davids, C.N. (Argonne National Lab., IL (United States)); Back, B.; Carpenter, M.P.; Henderson, D.J.; Henry, R.G.; Janssens, R.V.F.; Khoo, T.L.; Lauritsen, T.; Liang, Y.; Birdra, K.; Chung, W. Argonne National Lab., IL (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930169–2: 16. nuclear physics symposium, Oaxtepec (Mexico), 5-8 Jan 1993). Order Number DE93012902. Source: OSTI; NTIS; INIS; GPO Dep.

The Fragment Mass Analyzer (FMA) at the ATLAS accelerator has been operational for about one year. During that period a number of test runs and experiments have been carried out. The test runs have verified that the ion optics of the FMA are essentially as calculated. A brief facility description is followed by recent experimental results.

27038 (BNL–47596) **Axial variations in the magnetic field of superconducting dipoles.** Ghosh, A.K.; Robins, K.E.; Sampson, W.B. Brookhaven National Lab., Upton, NY (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920331–74: 4. international industrial symposium on the Super Collider, New Orleans, LA (United States), 4-6 Mar 1992). Order Number DE93014322. Source: OSTI; NTIS; INIS; GPO Dep.

Periodic variations in the field along the axis have been observed in a large number of superconducting dipoles. Both long and short versions of the SSC magnet have been examined as well as prototypes for the RHIC accelerator and coils from the CBA and ISABELLE projects. This field oscillation is present in all the components of the field. The period of the longitudinal pattern was found to match the conductor transposition length over a wide range of pitches. The amplitude of variation increases with time spent at high field and its decay has a complex time dependence. Unbalanced currents in the individual strands of the cable appear to be the cause of this effect and may also give rise to the unusually high sextupole drift observed near injection field in most dipoles.

27039 (BNL–48208) **On the high intensity aspects of AGS Booster proton operation.** Reece, R.K.; Ahrens, L.A.; Bleser, E.J.; Brennan, J.M.; Gardner, C.; Glenn, J.W.; Roser, T.; Shoji, Y.; van Asselt, W.; Weng, W.T. Brookhaven National Lab., Upton, NY (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–128: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014289. Source: OSTI; NTIS; INIS; GPO Dep.

Observations of high intensity effects on the proton performance of the AGS Booster are presented, including present operational limits and correction methods. The transverse emittances, optimum tune working points, damping of coherent transverse oscillations

and correction of stopband resonances through third-order are discussed in addition to the observed tune spread due to space charge forces. The initial longitudinal phase space distribution, capture and acceleration parameters and measurements are also given. Operational tools and strategies relevant to the high intensity setup are mentioned.

27040 (BNL–48236) **Ring diagnostics and consistency test of the model for the AGS Booster.** Luccio, A.; Auerbach, E.H. Brookhaven National Lab., Upton, NY (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–126: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014297. Source: OSTI; NTIS; INIS; GPO Dep.

From a systematic analysis of readings of the beam position monitors in the AGS Booster ring, combined with the transfer matrices between a few locations in the ring, calculated with MAD, the consistency of the model of the lattice has been tested. This technique has enabled us to (1) detect errors in the machine that subsequent survey during shutdown has confirmed, and (2) to measure the actual circulating beam momentum offset The method has proved rather general and convenient for accelerator diagnostics as part of a model-based accelerator control system and extensions are suggested.

27041 (BNL–48260) **Results from the AGS Booster transverse damper.** Russo, D.; Brennan, M.; Meth, M.; Roser, T. Brookhaven National Lab., Upton, NY (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–70: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014314. Source: OSTI; NTIS; INIS; GPO Dep.

To reach the design intensity of 1.5×10^{13} protons per pulse in the AGS Booster, transverse coupled bunch instabilities with an estimated growth rate of $1500s^{-1}$ have to be dampened. A prototype transverse damper has been tested successfully using a one turn digital delay and closed orbit suppression implemented in a programmable gate array. An updated damper, which includes an algorithm to optimize damping for a changing betatron rune, will also be presented.

27042 (BNL–48272) **Preliminary studies on a magneto-optical procedure for aligning RHIC magnets.** Goldman, M.A.; Sikora, R.E.; Shea, T.J. Brookhaven National Lab., Upton, NY (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–167: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015786. Source: OSTI; NTIS; INIS; GPO Dep.

Colloid dispersions of magnetite were used at SLAC and KEK to locate multipole magnet centers. We study the possible adaption of this method, to align RHIC magnets. A procedure for locating magnetic centers with respect to external fiducial markers, using electronic coordinate determination and digital TV image processing is described.

27043 (BNL–49073) **BNL volume H^- sources.** Alessi, J.G.; Prelec, K.; McCafferty, D. Brookhaven National Lab., Upton, NY (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-921145–8: Production and neutralization of negative ions and beams, Upton, NY (United States), 9-13 Nov 1992). Order Number DE93015793. Source: OSTI; NTIS; INIS; GPO Dep.

An H^- current of up 30 mA has been extracted from a 1 cm^2 aperture in a 20 cm diameter volume source with a conical filter field. From a 9.7 cm diameter version of this source, an H^- current of up to 35 mA was extracted from a 0.5 cm^2 aperture.In both sources, the electron-to-H^- ratio is typically < 10, and often < 5.

27044 (DOE/FTR–93013017) **[Travel to Germany and Switzerland to discuss the progress and further development of the TESLA collaboration, and to present a paper and attend the European particle accelerator conference in Berlin, under the auspices of the Technische Hochschule Berlin]: Foreign trip report, March 17–April 5, 1992.** Colestock, P.L. Fermi National Accelerator Lab., Batavia, IL (United States). 1992. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93013017. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The trip consisted of three parts. The first was a meeting at the Deutsches Elektronen-Sychrotron (DESY) to discuss the progress and further development of the TESLA collaboration, a joint project with Fermilab, DESY, Cornell, among others, to develop a superconducting linac option for future collider applications. Milestones in the fabrication and testing of a prototype cavity module were adopted. The second part was attendance at the European Particle Accelerator Conference in Berlin, under the auspices of the Technische Hochschule Berlin. A paper was delivered there on recent developments in nonlinear phenomena studied in the Tevatron. The third part consisted of a brief visit to CERN, conferring with members of the rf group there on several topics of mutual interest, including impedance measurements, instability studies, stochastic cooling, and rf systems.

27045 (ENEA-RT-NUCL–91-19, pp. 13-22) **Radiation protection at Frascati neutron generator.** Lucci, F.; Sandri, S. ENEA, Frascati (Italy). Oct 1991. (CONF-911105–Exc.: Symposium on implications of the new ICRP recommendations on radiological protection practices, Salamanca (Spain), 26-29 Nov 1991; RT/NUCL–91-19). In *Contributions to international conference of implications of new ICRP recommendations on radiation protection practice and interventions.* 22p. Order Number DE93799291. Source: OSTI; NTIS (US Sales Only); INIS.

The paper presents the radiation protection proposal for the D-T Frascati Neutron Generator (FNG) of ENEA (Italian Agency for Energy, New Technologies and the Environment). The proposal was submitted to the Italian regulatory authority examination, approved and is now nearly complete. Planned and potential exposure situations are described and the consequent system of protection is compared with that described in the revised basic recommendations of the ICRP (International Commission on Radiation Protection). The technical characteristics of the FNG, the results of the calculations performed for shield design and activation evaluation are reported considering typical applications and material composition of the generator, together with a schematic design of the plant layout.

27046 (ETDE-IT–93-184) **Environmental conservation by radiation technology: New Italian multi-purpose demonstration centre.** Tata, A.; Manni, S. ENEA, Rome (Italy); Officine Galileo SpA, Florence (Italy). 1992. 10p. (CONF-920909–: 8. international meeting on radiation processing, Beijing (China), 14-19 Sep 1992). Order Number DE93799272. Source: OSTI; NTIS (US Sales Only); INIS.

The new Italian R&D/Demonstration Centre, named CE.S.T.I.A. (CEntro Sperimentazione Tecnologie di Irraggiamento per l'Ambiente, namely, Experimental Centre for Environmental Applications of Radiation Technology), presented in this paper should represent the largest project in the world for research on environmental applications of radiation technology. The Center will be located in the South of Italy and foresees, over an area of 35,000 square meters, four independent irradiation plants, each one with a dedicated electron beam machine. The foreseen EB-machines features allow a large operative flexibility; the first research cycle will regard five activity lines: hazardous wastes, waste water, flue gases, hospital wastes, clean technologies. The Centre technical and economic features are described, together with an analysis of realistic spreading perspectives of linear accelerator radiation technology on the Italian industrial wastes management market.

27047 (FNAL/C–92/94) **Friction and wear of radiation resistant composites, coatings and ceramics in vacuum and low temperature environment.** Lipski, A.; Ruschman, M. Fermi National Accelerator Lab., Batavia, IL (United States). Apr 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9106431–1: CEC/ICMC conference, Huntsville, AL (United States), 11-14 Jun 1991). Order Number DE93014016. Source: OSTI; NTIS; INIS; GPO Dep.

Superconducting magnets used in accelerators such as the Superconducting Super Collider (SSC) are exposed to fast neutron

and gamma irradiation. Some of the components used in the SSC cryostat are fabricated from organic materials with low radiation resistance. The slide bearing material presently supporting the magnet assembly contains Teflon and must be replaced with a material of improved radiation resistance. A group of sliding materials, most of which have suitable radiation resistance, were tested under conditions of pressure, temperature, velocity, and vacuum typically encountered in normal cryostat operation. As this was a preliminary screening test, the samples were only cooled to liquid nitrogen temperature. The group of materials tested consists of composites, coated base metals, and ceramics. The criteria was to maintain a low coefficient of friction throughout the experiment in spite of changes in temperature and vacuum. Subsequent tests will expose finalist materials to fast neutron irradiation at liquid helium temperatures. This paper describes the experimental setup and presents data of the friction coefficient measurements taken for the various samples.

27048 (FNAL/C–92/98) **Alternate manufacturing processes and materials for the SSC dipole magnet coil end parts.** Lipski, A. (Fermi National Accelerator Lab., Batavia, IL (United States)); Bossert, R.; Brandt, J.; Hoffman, J.; Kobliska, G.; Zweibohmer, J.; Higinbotham, W.; Shields, R.; Sims, R. Fermi National Accelerator Lab., Batavia, IL (United States). Apr 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (SSCL-Preprint–97;CONF-920331–73: 4. international industrial symposium on the Super Collider, New Orleans, LA (United States), 4-6 Mar 1992). Order Number DE93014029. Source: OSTI; NTIS; INIS; GPO Dep.

Modern magnet designs such as the SSC dipole utilize smaller bore diameter and wider superconducting cable. Challenging winding techniques place greater emphasis on the role of the coil end parts. Their complex configuration is derived from their function of confining the conductors to a consistent given shape and location. Present end parts, made of G-10 composite, are manufactured utilizing complex and expensive 5-axis machining techniques. Several alternate manufacturing processes and materials described in this paper will result in a substantial cost reduction for mass producing the end parts. The alternate processes are divided into two major groups. The composite group consists of Resin Transfer Molding (RAM), Compound Transfer Mold (CAM), Injection Molded Composite (IMP) and Compression Molded Composite (CC). The base metal coated group consists of Chemical Vapor Deposition (CAD) dip coating and hard coatings/anodizing. The paper will provide an overview of the various processes and compare test performance and cost to that of the process currently used.

27049 (FNAL/C–93/075) **Study of stability of beam in the Fermilab main injector.** Mishra, C.S.; Harfoush, F. Fermi National Accelerator Lab., Batavia, IL (United States). Apr 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-921077–5: Stability of particle motion in storage rings, Upton, NY (United States), 18-24 Oct 1992). Order Number DE93014920. Source: OSTI; NTIS; INIS; GPO Dep.

The Fermilab Main Injector is a new 150 GeV proton synchrotron, designed to replace the Main Ring and improve the high energy physics potential of Fermilab. The status of the Fermilab accelerator complex upgrade will be discussed. Study of the stability of the beam in the Main injector will be discussed. Detuning and corrector scheme to improve the dynamic aperture of the Main Injector will be presented. Tune modulation caused by octupolar detuning will be discussed.

27050 (FNAL/C–93/108) **SSC 50 mm dipole magnet cryostat thermal measurement results.** Boroski, W.N.; Nicol, T.H.; Ruschman, M.K.; Schoo, C.J. Fermi National Accelerator Lab., Batavia, IL (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-930537–55: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93015534. Source: OSTI; NTIS; INIS; GPO Dep.

A prototype Superconducting Super Collider (SSC) 50 mm dipole magnet cryostat, DCA323, was instrumented at Fermilab and delivered to the SSC Laboratory for installation into the accelerator systems string test facility. In series with other magnets, the instrumented cryostat will be used to quantify and verify cryostat thermal performance with respect to design requirements. Prior to leaving Fermilab, DCA323 was subjected to magnetic testing at the Magnet Test Facility (MTF). This presented an opportunity to obtain preliminary thermal performance data under simulated operating conditions. It should be noted that measurements of overall cryostat thermal performance were not possible during the MTF measurements as the magnet test stands are designed for magnetic rather than thermal testing. They are not designed to limit heat inleak to the ends of the cryostat, which has been shown to have a significant effect on overall measured thermal performance. Nonetheless, these measurements do offer insight into the performance of several of the cryostat components and sub-systems.

27051 (FNAL/C–93/110) **The design and performance of a high sensitivity loss monitor system for use in the Fermilab antiproton rings.** Halling, A.M.; Zagel, J.R.; Hahn, A. Fermi National Accelerator Lab., Batavia, IL (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-930511–142: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014921. Source: OSTI; NTIS; INIS; GPO Dep.

As part of a general laboratory cleanup of hazardous materials from the accelerator enclosures we have replaced the liquid scintillator based paint can type beam loss monitors with improved loss monitors based on plastic centiliter. This paper describes the design of these counters and their performance in the PBAR source.

27052 (FNAL/C–93/113) **Experience with the Source Evaluation Board method of procuring technical components for the Fermilab Main Injector.** Harding, D.J.; Collins, J.P.; Kobliska, G.R.; Chester, N.S.; Pewitt, E.G.; Fowler, W.B. Fermi National Accelerator Lab., Batavia, IL (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-930511–141: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014922. Source: OSTI; NTIS; GPO Dep.

Fermilab has adopted the Source Evaluation Board (SEB) method for procuring certain major technical components of the Fermilab Main Injector. The SEB procedure is designed to ensure the efficient and effective expenditure of Government funds at the same time that it optimizes the opportunity for attainment of project objectives. A qualitative trade-off is allowed between price and technical factors. The process involves a large amount of work and is only justified for a very limited number of procurements. Fermilab has gained experience with the SEB process in awarding subcontracts for major subassemblies of the Fermilab Main Injector dipoles.

27053 (FNAL/C–93/118) **Impedance budget and beam stability analysis of the Fermilab Main Injector.** Martens, M.A.; Ng, K.Y. Fermi National Accelerator Lab., Batavia, IL (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-930511–138: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014925. Source: OSTI; NTIS; INIS; GPO Dep.

The impedance budget of the Fermilab Main Injector (MI) is estimated, which includes the contributions from the resistive walls, bellows, rf cavities, steps, Lambertsons, etc. Beam stability during ramping and bunch coalescence is analyzed. The transverse resistive-wall coupled bunch growth is found to be somewhat worse than the situation in the Main Ring (MR).

27054 (IFVE-OKU–91-151) **The development of software application at the IHEP accelerator beam extraction control system.** Afonin, A.G.; Prisyazhnykh, S.G.; Sokolov, S.V.; Sokolova, O.A.; Sukhomlinov, V.F. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1991. [10p.] (In Russian). Order Number DE93629633. Source: OSTI; NTIS (US Sales Only); INIS.

The development of the software application for the minicomputer SM-4, that helps to decide the task of processing and

displaying informations at the IHEP accelerator beam extraction control system is considered. The software runs under OS RSX11M with using the FORTRAN and MACRO-11 programming languages. 7 refs.; 5 figs.

27055 (IFVE-OKU–91-157) **Pickup for the radial position of the beam center of gravity in the master oscillator system of the accelerator field frequency of the IHEP proton synchrotron.** Vazhenin, V.A.; Ignashin, N.A.; Lebedev, O.P. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1991. [7p.] (In Russian). Order Number DE93628260. Source: OSTI; NTIS (US Sales Only); INIS.

The presence of one radial pickup in the accelerator azimuth assigned for the master oscillator system of the accelerating field frequency makes the mean radius of particle accelerating dependent of the orbit harmonics orbits. This, in its turn, imposes streak requirements for the correction technique of the magnetic field harmonics. An additional radial pick up with a corresponding processing of the beam signal was introduced into beam feedback circuit. 1 ref.; 4 figs.

27056 (IFVE-OLU–92-115) **Automatic inspection of linear accelerator system operation.** Borovikov, A.A.; Khromova, G.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. [9p.] (In Russian). Order Number DE93628255. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper there is suggested the procedure for the automatic control of the linear accelerator systems operation situation. The simple data model for the estimate of time variation linac systems parameters is used to represent an operating situation with the formalistic data. The knowledge-based algorithm is proposed to automatic discover time points and signs of arising infringements. 4 refs.; 3 figs.

27057 (IFVE-ONF–92-106) **Magnetized muon filter for beam-dump experiments.** Ammosov, V.V.; Garkusha, V.I.; Zaruchejskij, V.G.; Kartashev, V.P.; Kotov, V.I.; Mokhov, N.V.; Novoskol'tsev, F.N.; Uzunyan, A.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. [12p.] (In Russian). Order Number DE93628261. Source: OSTI; NTIS (US Sales Only); INIS.

The design of magnetized muon filter was elaborated for τ-neutrino research in beam-dump experiment. The parameters of muon fiter were optimized for 3000 GeV initial proton beam and 2 meters detector radius installed at the distance 300 of meters from the target. The main sources determining muon background on the detector were analyzed. It is shown that the filter provides the muon flux on the detector less than 10^{-11} muonxproton^{-1}. 11 refs.; 10 figs.

27058 (IFVE-ORI–91-160) **Radiation situation in the region of block 27 of the U-70 main ring.** Borodin, V.E.; Gurchin, V.Yu. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1991. [16p.] (In Russian). Order Number DE93629644. Source: OSTI; NTIS (US Sales Only); INIS.

This note describes results of stadying radiation situation in region of IHEP proton synchrotron where materials are irradiated for the study of radiation damage. 7 refs.; 28 figs.; 2 tabs.

27059 (IFVE-ORI–92-64) **The hadron flux inside of experimental hall-2 of UNK hadron area.** Bajshev, I.S.; Bityukov, S.I.; Kryuchkov, V.P.; Mokhov, N.V.; Uzunyan, A.V.; Chepegin, V.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. [8p.] (In Russian). Order Number DE93628262. Source: OSTI; NTIS (US Sales Only); INIS.

The results on calculating of radiation hadron flux distributions inside and around of UNK experimental hall-2 are presented. The radiation source is the inelastic interactions of hadron beam with the elements of experimental equipment. Ways for decreasing scattered radiation dose rate are given. 6 refs.; 10 figs.

27060 (INS–956) **A new cooling and focusing device for ion guide.** Xu Hongjie; Wada, Michiharu; Tanaka, Jinichi; Kawakami, Hirokane; Katayama, Ichiro; Ohtani, Shunsuke. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Dec 1992. 22p. Order Number DE93508254. Source: OSTI; NTIS; INIS.

A highly efficient focusing device using RF multipole field 'sextupole-ion-beam-guide (SPIG)' has been developed for the ion guide isotope separator on-line (IGISOL). The SPIG, placed after the nozzle, consists of the six circular rods uniformly distributed on a circle in the plane perpendicular to the symmetry axis. Under the combined action of the sextupole RF electric field produced by the rods and helium gas flow, a good focusing and cooling of ions from the Ion Guide with highly efficient transmission are achieved in the SPIG. The experimental results using a discharge ion source show that almost nearly 90 % of the ions out of the nozzle can be transported through the SPIG, and the width of the kinetic energy distribution after the SPIG is about 0.8 eV (FWHM). These experimental results coincide well with the Monte-Carlo simulation results and the simulation also predicts the size of the spatial distribution in the plane perpendicular to the symmetry axis is smaller than 1 mm$^{\phi}$ at the end of the SPIG. (author).

27061 (IYaF–91-113) **The VLEPP final focus system.** Seryj, A.A. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. [33p.] (In Russian). Order Number DE93629645. Source: OSTI; NTIS (US Sales Only); INIS.

The results of the VLEPP final focus system investigation are presented. The common limitations for such systems are drown. Problems connected with background in the interaction region. IP design, optics, tolerances are discussed. The test low aperture final quadrupole with high gradient, the method and the results of the field distribution measurements for such a quadrupole are also presented. 24 refs.; 10 figs.; 1 tab.

27062 (IYaF–92-76) **Optimal choice of a target for producing e^+e^- polarized beams for a linear collider.** Bukin, A.D.; Mikhajlichenko, A.A. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1992. [36p.] (In Russian). Order Number DE93629646. Source: OSTI; NTIS (US Sales Only); INIS.

For polarized particles generation with the help of radiation from helical wiggler, applicable in linear collider, new calculations are represented. This calculations are made with the codes UNIMOD2, CONVER and OBRA, concerning the choice of optimal thickness and form of the target for different energy of initial beam. Optimized target gives maximal yield of polarized particles. Heating conditions of the target are described also. Estimations were made also how to test this method of particle production at SLAC Linac. 18 refs.; 16 figs.; 13 tabs.

27063 (JAERI-M–93-047) **JAERI TIARA annual report vol. 1 (1992): April 1991 - March 1992.** Ishigaki, Isao (Japan Atomic Energy Research Inst., Takasaki, Gunma (Japan). Takasaki Radiation Chemistry Research Establ); Nashiyama, Isamu; Naramoto, Hiroshi; Omichi, Hideki; Tanaka, Ryuichi; Watanabe, Hiromasa; Watanabe, Hiroshi (eds.). Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 208p. Order Number DE93508317. Source: OSTI; NTIS; INIS.

This annual report describes research activities which have been performed with the JAERI TIARA (Takasaki Ion Accelerators for Advanced Radiation Application) facilities from April 1, 1991 to March 31, 1992, and also gives an outline of the ion accelerators and surrounding apparatus which have been constructed and prepared for various experiments. As well as an outline of the characteristics of AVF cyclotron, 3 MV tandem electrostatic accelerator and other ones, included are 25 summary reports on preparation of experimental apparatus and on the preliminary results of experimental studies using the 3 MV tandem accelerator in the different research fields of beam technology, materials for space environment and nuclear fusion reactor, organic and inorganic functional materials, biology, medicine, radiation chemistry, radioisotope production and nuclear chemistry. Lists of publication, staff of TIARA and cooperated researchers are also given. (author).

27064 (KCP–613-5221) **High density harp for SSCL linac.** Fritsche, C.T. (Allied-Signal, Inc., Kansas City, MO (United States). Bendix Kansas City Div.); Krogh, M.L.; Crist, C.E. Allied-Signal,

Inc., Kansas City, MO (United States). Bendix Kansas City Div. May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-930511–7: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93013434. Source: OSTI; NTIS; INIS; GPO Dep.

AlliedSignal Inc., Kansas City Division, and the Superconducting Super Collider Laboratory (SSCL) are collaboratively developing a high density harp for the SSCL linac. This harp is designed using hybrid microcircuit (HMC) technology to obtain a higher wire density than previously available. The developed harp contains one hundred twenty-eight 33-micron-diameter carbon wires on 0.38-mm centers. The harp features an onboard broken wire detection circuit. Carbon wire preparation and attachment processes were developed. High density surface mount connectors were located. The status of high density harp development will be presented along with planned future activities.

27065 (KEK–92-21) **Collective issues related to B-factories.** Pestrikov, D.V. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Feb 1993. 41p. Order Number DE93508336. Source: OSTI; NTIS; INIS.

This report reviews the limitations on the performance of the planned B- and Φ-factories due to the collective interactions of stored bunches. Together with the traditional revision of the limitations due to the single- and multi-bunch interaction with surrounding electrodes, we briefly discuss in this report the limitations on the performance due to collective beam-beam instabilities of colliding beams and instabilities due to the collective interaction of beams with the ions. (author).

27066 (LA-UR–93-1737) **Injector design for high-current CW proton linacs.** Stevens, R.R. Jr.; Sherman, J.D.; Schneider, J.D. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–101: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014575. Source: OSTI; NTIS; INIS; GPO Dep.

We present an injector design for high-power cw proton linacs with particular emphasis on intense neutron-spallation sources. Long-term operational reliability and availability dominate over specific beam parameters for these accelerators. We discuss technical requirements for the ion source and low-energy beam transport line and compare different options. A prototype design for a 75-kV, 110-mA cw proton injector is presented.

27067 (LA-UR–93-1743) **Initial operation of the CW 8X H^- ion source discharge.** Smith, H.V. Jr.; Allison, P.; Geisik, C.; Schmitt, D.R.; Schneider, J.D.; Stelzer, J.E. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–81: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014574. Source: OSTI; NTIS; INIS; GPO Dep.

A pulsed 8X source was built and the H^- beam current, emittance, and power efficiency were measured. These results were promising, so a cooled, dc version designed for operation at arc power levels up to 30 kW was built. Testing of the CW 8X source discharge is underway. The design dc power loading on the cathode surface is 900 W/cm^2, considerably higher than achieved in any pervious Penning surface-plasma source (SPS). Thus, the electrode surfaces are cooled with pressurized, hot water. We describe the source and present the initial operating experience and arc test results.

27068 (LA-UR–93-1778) **Monitoring production target thickness.** Oothoudt, M.A. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–103: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014568. Source: OSTI; NTIS; INIS; GPO Dep.

Pion and muon production targets at the Clinton P. Anderson Meson Physics Facility consist of rotating graphite wheels. The previous target thickness monitoring Procedure scanned the target across a reduced intensity beam to determine beam center. The fractional loss in current across the centered target gave a measure of target thickness. This procedure, however, required interruption of beam delivery to experiments and frequently indicated a different fractional loss than at normal beam currents. The new monitoring Procedure compares integrated ups and downs toroid current monitor readings. The current monitors are read once per minute and the integral of readings are logged once per eight-hour shift. Changes in the upstream to downstream fractional difference provide a nonintrusive continuous measurement of target thickness under nominal operational conditions. Target scans are now done only when new targets are installed or when unexplained changes in the current monitor data are observed.

27069 (LA-UR–93-1782) **Comprehensive beam jitter study for the commissioning of the intermediate matching section and drift tube linac at ground test accelerator.** Barr, D.S.; Gilpatrick, J.D. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–102: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014567. Source: OSTI; NTIS; INIS; GPO Dep.

An experiment on the Ground Test Accelerator (GTA) for the Neutral Particle Beam (NPB) at Los Alamos commissioned the intermediate matching section (IMS) and a single 3.2-MeV drift tube linac (DTL). A diagnostic platform or D-plate was used at the output of the DTL in order to measure various beam parameters. The D-plate and other diagnostic devices located in the IMS, provided measurement of the horizontal and vertical beam position, current, energy, and output phase. These instruments were installed to perform a complete beam jitter analysis based on the current beamline configuration to better understand the causes of any jitter sources as well as to prepare for the initial design of future feedback control systems. The study explored all types of jitter for various beamline configurations. Both interpulse jitter (jitter from pulse to pulse) and intrapulse jitter (jitter within each macropulse) were investigated. Spectral and statistical time analyses were used. Spectral analysis was employed to gain an understanding of the spectral contributions of various jitter sources to determine the degree of correction possible. Statistical time analysis gave a good overall representation of the jitter magnitude and allowed easy comparison of jitter for different beamline configurations, as well as an easy method for determining consistent problems.

27070 (LA-UR–93-1821) **Pulsed taut-wire measurement of the magnetic alignment of the ITS induction cells.** Melton, J.G.; Burns, M.J.; Honaberger, D.J. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–105: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014555. Source: OSTI; NTIS; INIS; GPO Dep.

The mechanical and magnetic alignment of the first eight induction-cell, solenoid magnets of the Integrated Test Stand (ITS) for the Dual-Axis Radiographic Hydrodynamic Test (DARHT) facility were measured by observing the deflection of a fine, taut wire carrying a pulsed current. To achieve the required alignment (less than 0.25 mm offset and less than 5 mrad tilt), the magnet design uses quadrufilar windings and iron field-smoothing rings. After detailed measurements of each solenoid magnet, the cells are assembled and then mechanically aligned using a laser and an alignment target moved along the cell centerline. After the cells are in final position, the pulsed wire method is used to verify the magnetic alignment. The measurements show an average offset of the magnetic axes from the mechanical axis of 0. 15 mm, with a maximum offset of 0.3 mm. The average tilt of the magnetic axis was 0.7 mrad with a maximum tilt of 1.4 mrad. Tilts are corrected to less than 0.3 mrad, using dipole trim magnets assembled into each cell. Correction is limited noise.

27071 (LA-UR–93-1827) **Prototype flying-wire beam-profile monitor.** Barlow, D.B.; Fortgang, C.M.; Gilpatrick, J.D.; Meyer, R.E.; Rendon, A.M.; Warren, D.S.; Wilke, M.D. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE

Contract W-7405-ENG-36. (CONF-930511–98: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014651. Source: OSTI; NTIS; INIS; GPO Dep.

A prototype flying-wire beam-profile monitor has been designed, fabricated and tested to measure profiles of highcurrent high-duty electron beams. The device measures the beam's horizontal and vertical profile with a pair of thin carbon filaments mounted on a wheel. The beam that intercepts the filaments, or wires, produces electrons by secondary emission in proportion to the incident beam current. The secondary electron signal is detected either by measuring the charge depletion current on the wires or by measuring the current collected on a pair of positively biased charge collectors. A servo motor is used to accelerate the wheel from rest to a speed of 25 RPS in less than half a revolution passing the wires through the path of the beam at a speed of ~10 m/s. The wheel is then decelerated back to rest before completing one full revolution. The precise timing requirements of this application lead to the development of an indexer capable of controlling the servo motor position with less than 20 μs of timing jitter.

27072 (LA-UR–93-1828) **Commissioning of the first drift tube linac module in the Ground Test Accelerator.** Johnson, K.F.; Sander, O.R.; Atkins, W.H.; Bolme, G.O.; Bowling, S.; Cole, R.; Connolly, R.; Denney, P.; Erickson, J.; Gilpatrick, J.D.; Ingalls, W.B.; Kersteins, D.; Kraus, R.; Lysenko, W.P.; McMurry, D.; Mottershead, C.T.; Power, J.; Rose, C.; Rusthoi, DLos Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–106: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014551. Source: OSTI; NTIS; INIS; GPO Dep.

The Ground Test Accelerator (GTA) has the objective of verifying much of the technology required for producing high-brightness, high-current H^- beams. GTA commissioning is staged to verify the beam-dynamics design of each major accelerator component as it is brought on-line. The major components are the 35-keV H^- injector, the 2.5-MeV radio-frequency quadrupole (RFQ), the intertank matching section (IMS), the 3.2 MeV first $2\beta\lambda$ drift tube linac (DTL-1) module, and the 24-MeV GTA with 10 DTL modules. Results from the DTL-1 beam experiments will be presented.

27073 (LA-UR–93-1833) **High bandwidth beam current monitor.** Baltrusaitis, R.M. (Los Alamos National Lab., NM (United States)); Ekdahl, C.A.; Cooper, R.G.; Peterson, E.; Warn, C.E. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36 ;AC08-88NV10617. (CONF-930511–96: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014737. Source: OSTI; NTIS; GPO Dep.

A stripline directional coupler beam current monitor capable of measuring the time structure of a 30-ps electron beam bunch has been developed. The time response performance of the monitor compares very well with Cherenkov light produced in quartz by the electron beam. The four-pickup monitor is now used on a routine basis for measuring the beam duration, tuning for optimized beam bunching, and centering the bunch in the beam pipe.

27074 (LA-UR–93-1847) **The Los Alamos VXI-based modular RF control system.** Jachim, S.P.; Ziomek, C.; Natter, E.F.; Regan, A.H.; Hill, J.; Eaton, L.; Gutscher, W.D.; Curtin, M.; Denney, P.; Hansberry, E.; Brooks, T. Los Alamos National Lab., NM (United States). [1993]. 6p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–97: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014548. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the design and implementation of the Los Alamos modular RF control system, which provides high-performance feedback and/or feedforward control of RF accelerator cavities. This is a flexible, modular control system which has been realized in the industry-standard VXI cardmodular format. A wide spectrum of system functionality can be accommodated simply by incorporating only those modules and features required for a particular application. The fundamental principles of the design approach are discussed. Details of the VXI implementation are given, including the system architecture and interfaces, performance capabilities, and available features.

27075 (LA-UR–93-1848) **The effects of temperature and rf power level on the tuning of the water-cooled SSC Low-Energy Booster cavity.** Friedrichs, C. (Los Alamos National Lab., NM (United States)); Hulsey, G. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–107: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014547. Source: OSTI; NTIS; INIS; GPO Dep.

The SSC Low-Energy Booster (LEB) cavity must rapidly tune from 47.52 to 59.78 MHz. The cavity tuner will use transversely biased ferrite control of the cavity resonance. The thermal expansion of a cavity's materials affects its resonance. There are two other known temperature mechanisms that affect resonance in the water-cooled LEB cavity. The saturation magnetization of the ferrite is a function of temperature, and since the ferrite permeability is dependent on the saturation magnetization, the ferrite permeability is also temperature dependent. The ferrite cooling water is present in the tuner rf field, hence the water permittivity, which is very temperature dependent, also affects cavity resonance. While taking data on the SSC Test Cavity to quantify the effect of temperature on the resonance, we observed that the rf power level also perturbed the resonance. It was readily apparent from the data that the power level affected the resonance much more strongly at low values of control bias than at high values. In fact, when we calculate an apparent modified control-bias H field that produces the observed resonance shift, we noticed an almost perfect, though non-linear, correlation between the ratio of H_{rf} to H_{bias} and the apparent modified bias field, H_{app}. This paper will present a set of equations to predict the resonance shifts produced by changes in temperature and rf power level. It will also present the techniques, both theoretical and empirical, by which these equations are derived. Finally, some of the methods for dealing with these resonance shifts will be discussed.

27076 (LA-UR–93-1853) **Control system architecture: The standard and non-standard models.** Thuot, M.E.; Dalesio, L.R. Los Alamos National Lab., NM (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–115: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014546. Source: OSTI; NTIS; INIS; GPO Dep.

Control system architecture development has followed the advances in computer technology through mainframes to minicomputers to micros and workstations. This technology advance and increasingly challenging accelerator data acquisition and automation requirements have driven control system architecture development. In summarizing the progress of control system architecture at the last International Conference on Accelerator and Large Experimental Physics Control Systems (ICALEPCS) B. Kuiper asserted that the system architecture issue was resolved and presented a "standard model". The "standard model" consists of a local area network (Ethernet or FDDI) providing communication between front end microcomputers, connected to the accelerator, and workstations, providing the operator interface and computational support. Although this model represents many present designs, there are exceptions including reflected memory and hierarchical architectures driven by requirements for widely dispersed, large channel count or tightly coupled systems. This paper describes the performance characteristics and features of the "standard model" to determine if the requirements of "non-standard" architectures can be met. Several possible extensions to the "standard model" are suggested including software as well as the hardware architectural feature.

27077 (LA-UR–93-1867) **Stripper-foil scan studies of the first-turn beam loss mechanism in the LAMPF proton storage ring (PSR).** Hutson, R.: Fitzgerald, D.; Frankle, S.; Macek, R.; Plum, M.; Wilkinson, C. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC

(United States). DOE Contract W-7405-ENG-36. (CONF-930511–46: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014478. Source: OSTI; NTIS; INIS; GPO Dep.

First-turn beam losses in the LAMPF Proton Storage Ring were measured as a function of the left-right position of the carbon foil used to strip neutral hydrogen atoms to H^+ for proton injection into the PSR. Two foil thicknesses, 200 and 300 $\mu g/cm^2$, were tested. Results indicated that first-turn loss is caused predominately by magnetic field stripping of a small fraction of the H_0 atoms that pass through the stripper foil without being stripped to protons, and the results were not consistent with a mechanism involving protons originating from atoms in the halo of the neutral beam incident on the stripper foil.

27078 (LA-UR–93-1871) **Results of adaptive feedforward on GTA.** Ziomek, C.D.; Denney, P.M.; Regan, A.H.; Lynch, M.T.; Jachim, S.P.; Eaton, L.E.; Natter, E.F. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–93: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014475. Source: OSTI; NTIS; GPO Dep.

This paper presents the results of the adaptive feedforward system in use on the Ground Test Accelerator (GTA). The adaptive feedforward system was shown to correct repetitive, high-frequency errors in the amplitude and phase of the RF field of the pulsed accelerator. The adaptive feedforward system was designed as an augmentation to the RF field feedback control system and was able to extend the closed-loop bandwidth and disturbance rejection by a factor of ten. Within a second implementation, the adaptive feedforward hardware was implemented in place of the feedback control system and was shown to negate both beam transients and phase droop in the klystron amplifier.

27079 (LA-UR–93-1880) **Measuring emittance using beam position monitors.** Russell, S.; Carlsten, B. Los Alamos National Lab., NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–48: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014470. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos Advanced Free Electron Laser uses a high charge (greater than InC), low emittance (normalized rams emittance less than 5π mm mrad) photoinjector driven accelerator. The high brightness achieved is due, in large part, to the rapid acceleration of the electrons to relativistic velocities. As a result, the beam does not have time to thermalize its distribution and its universe profile is, in general, non-Gaussian. This, coupled with the very high brightness, makes it difficult to measure the transverse emittance. Techniques used must be able to withstand the rigors of very intense electron beams, and not be reliant on Gaussian assumptions. Beam position monitors are ideal for this. They are not susceptible to beam damage, and it has been shown previously that they can be used to measure the transverse emittance of a beam with a Gaussian profile. However, this Gaussian restriction is not necessary and, in fact, a transverse emittance measurement using beam position monitors is independent of the beam's distribution.

27080 (LA-UR–93-1881) **Measured performance of the GTA rf systems.** Denney, P.M.; Jachim, S.P. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–100: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014469. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the performance of the RF systems on the Ground Test Accelerator (GTA). The RF system architecture is briefly described. Among the RF performance results presented are RF field flatness and stability, amplitude and phase control resolution, and control system bandwidth and stability. The rejection by the RF systems of beam-induced disturbances, such as transients and noise, are analyzed. The observed responses are also compared to computer-based simulations of the RF systems for validation.

27081 (LA-UR–93-1893) **Superconducting multicell cavity development program at Los Alamos.** Rusnak, B. (Los Alamos National Lab., NM (United States)); Spalek, G.: Gray, E.; DiMarco, J.N.; DeHaven, R.; Novak, J.; Walstrom, P.; Zumbro, J.; Thiessen, H.A.; Langenbrunner, J. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–43: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014467. Source: OSTI; NTIS; INIS; GPO Dep.

The superconducting rf (SCRF) cavity Development Program at Los Alamos has designed, fabricated, and tested single-cell niobium cavities at 3-GHz and 805-MHz. This work is being done in preparation for procuring and testing a multicell niobium cavity. The multicell cavity is designed to accelerate protons at $\beta = 0.9$; initial tests will be without beam. Progammmatic changes have required us to modify our plans to install a 6800-liter helium cryostat and a 12.8-g/s helium pump. We will use an installed cryostat to test the multicell cavity. Also, the cavity will be modified from a seven-cell to a four-cell structure to match the dimensions of the installed cryostat. Previous reports concentrated on 3-GHz results. In this paper, some of the latest results of the 805-MHz cavity tests are presented. Modifications to allow high pulsed power (HPP) testing on 805-MHz single- and four-cell cavities are proceeding. Glow discharge cleaning of an 805-MHz niobium cavity resulted in a decrease in cavity performance. The cavity was restored to previous performance levels with buffered chemical polishing (bcp). Initial results with high-pressure water cleaning show the process is useful in restoring cavity performance.

27082 (LA-UR–93-1910) **Application of precision mechanical engineering techniques to the design of a moderate energy beam transport for the FAA explosive detection system.** Lujan, R.; Christensen, K. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–99: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014461. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses the application of precision mounting and alignment techniques to a moderate energy beam transport system (MEBT) used on the exit of a 1.75 MeV RFQ. While frequently found in optical systems, techniques-such-as kinematic mounting, and degree-of-freedom decoupling, are not as widely used for accelerator components. The MEBT consist of one permanent magnet quadrupole, four electro magnet quadrupole, and one debuncher cavity. Included in the paper are discussions of design and fabrication considerations as well as, installation, alignment and operations experience during the successful implementation on a working accelerator.

27083 (LA-UR–93-1912) **Response of air-filled ion chambers to high-intensity radiation pulses.** Plum, M.; Brown, D. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–51: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014460. Source: OSTI; NTIS; INIS; GPO Dep.

Ion chambers are one of the most popular types of detectors used for beam loss-monitor systems. To provide a foundation for the development of future loss-monitor systems, and to fully characterize the ion chambers in use at LAMPF, we have studied the response of air-filled cylindrical ion chambers to high-intensity, short-duration radiation pulses. The most intense pulses were about 180 rad in 250 ns (the equivalent steady-state dose rate was about 700 Mrad/h). We filled our chambers with nitrogen gas at 760 Torr and air at 600 Torr. The ion chambers were driven into extreme nonlinear response. We hope these data will be used to design loss-monitor systems based on air-filled ion chambers, thus eliminating the need for gas-flow systems and/or airtight ion chambers.

27084 (LA-UR–93-1924) **Volume H^- Ion source development at LAMPF.** York, R.L.; Tupa, D.; Swenson, D.R.; Damjanovich, R. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract W-7405-ENG-36. (CONF-930511–92: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014455. Source: OSTI; NTIS; INIS; GPO Dep.

One method of increasing the intensity of the LAMPF proton Storage Ring is to use a brighter H^- ion source. To develop such a source, the performance of the small LBL dipole filter and the BNL toroidal filter volume H^- sources are being investigated. Results of testing a new high-duty-factor design of the BNL toroidal filter volume source are discussed. Results of experiments to reduce the electron to H^- ratio and modulate the beam intensity in the small LBL source are presented.

27085 (LA-UR–93-1928) **Cryogenic cooling system for the ground test accelerator.** Edeskuty, F.J. (Los Alamos National Lab., NM (United States)); Stewart, W.F.; Moeller, J.; Durham, F.; Spulgis, I. Los Alamos National Lab., NM (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930703–1: International cryogenic engineering conference and international cryogenic materials conference, Albuquerque, NM (United States), 12-16 Jul 1993). Order Number DE93014393. Source: OSTI; NTIS; GPO Dep.

A cryogenic cooling system has been designed, built and tested for the Ground Test Accelerator (GTA) at the Los Alamos National Laboratory. Major components of the GTA require cooling to less than 50 K to reduce rf-heating and to increase thermal stability. The cooling system is capable of cooling (at an acceptable rate for thermal stresses) the cryogenically cooled components and then maintaining them at their operating temperature during accelerator testing for all modes and power levels of operation. The accelerator components are cooled by circulating cold, dense helium gas (about 21 K and 2.1 MPa) through the components. The circulating helium is refrigerated in a heat exchanger that uses boiling liquid hydrogen as a source of refrigeration. The cryogenic cooling system consists of the following major components: a liquid hydrogen (LH_2) storage Dewar with a transfer line to an LH_2 run tank containing an LH_2/gaseous helium (GHe) heat exchanger, circulation lines, and a circulation pump. The system, sized to cool a load of approximately 40 kW at temperatures as low as 20 K, is operational, but has not yet been operated in conjunction with the accelerator.

27086 (LA-UR–93-1955) **Integrating Log-Ratio position processing for the Los Alamos Proton Storage Ring extraction line.** Hardek, T.W. (Los Alamos National Lab., NM (United States)); Band, A. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–37: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014356. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos Proton Storage Ring (PSR) compressor ring intended to accept 1-msec-long p macropulses from the LAMPF linear accelerator and compress these pulses to 250 nsec in length. Beam position monitor sensors of the terminated strip-line design centered at 200 nsec are provided in the transport line from LAMPF, the PSR injection line, the PSR ring, and the extracted beam line. Strip-line sensors used in conjunction with phase processing are a good match for linac transport lines and PSR injection lines where there exists a strong 200-MHz frequency component but lead to difficulties in the ring and extracted beam line where this component tends to wash out. This paper describes the development of Integrating Log-Ratio processing techniques, which utilize the original strip line sensors to achieve a major improvement in position monitoring for the extracted beam line. The design concepts are discussed and the present hardware is described in detail. Operational difficulties encountered during the development process are discussed and actual beam-related results are provided.

27087 (LA-UR–93-2038) **Measurement of H zero excited states produced by foil stripping of 800-MeV H^- ions.** Donahue, J.B. (Los Alamos National Lab., NM (United States)); Clark, D.A.; Cohen, S.; Fitzgerald, D.; Frankle, S.C.; Huston, R.L.; Macek, R.; MacKerrow, E.; van Dyck, O.; Wilkinson, C.; Byrant, H.; Gulley, M.; Halka, M.; Keating, P.; Miller, W. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–45: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014391. Source: OSTI; NTIS; INIS; GPO Dep.

Foil stripping of H^- directly to H^+ is being considered for proton injection in the next generation of high-current proton storage rings. This technique can result in significant losses because excited states of HO, which are also produced in the foil, are field stripped in the downstream bending magnets. Without due care in the injection system design, many of the resulting protons will be outside the acceptance of the storage ring and will be quickly lost. We measured the production of such H^0 excited states at the LAMPF High Resolution Atomic Beam Facility. An 800-MeV H^- beam was passed through carbon foils of thicknesses 70, 100, 200, and 300 $\mu g/cm^2$, and the excited states were analyzed by a special magnet downstream of the foil. The magnet had a linear field gradient so that the trajectories of the outgoing protons could be used to reconstruct the field values at which the various H^0 stripped. We found that about 1% of the H^0 emerge in excited states which can be stripped to protons by ring-bending magnets.

27088 (LBL–34052) **Magnetic measurements of the 5 meter QC series quadrupoles at Lawrence Berkeley Laboratory.** Barale, P.; Benjegerdes, B.; Caspi, S.; Green, M.I.; Lietzke, A.; Schermer, R.; Taylor, C.; Van Dyke, D. Lawrence Berkeley Lab., CA (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (MT–470;SC-MAG–409;CONF-930537–52: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93015175. Source: OSTI; NTIS; GPO Dep.

From May 1991 to September 1992, magnetic measurements were performed on six 5 meter prototype SSC quadrupoles designed and built at Lawrence Berkeley Laboratory (LBL). In addition, one of the quadrupoles was disassembled, reassembled and remeasured. The purpose of this paper is to review the magnetic measurements program and give a summary of some of the results of the magnet testing.

27089 (NIKHEF-K-DIGEL–92-8) **Bundle profile monitor for AmPS.** Beuzekom, M.G. van; Es, J.T. van. Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie K. 1992. [32p.] (In Dutch). Order Number DE93629647. Source: OSTI; NTIS; INIS.

The Bundle Profile Monitor is a measurement instrument by which the profile (cross sections) of the electron bundles of MEA are measured. The monitors are used in the injection line of AmPS to determine the bundle profile before and after the injection septum. This report gives a short description of the whole instrument, followed by a description of analogous electronics of the monitor. At the same time, this report contains the adjust-procedure of the monitor-electronics. (author). 14 figs., 1 tab.

27090 (NIKHEF-K-DIGEL–92-9) **RF-Station control crate.** Beuzekom, M.G. van; Es, J.T. van. Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie K. 1992. [18p.] (In Dutch). Order Number DE93629638. Source: OSTI; NTIS; INIS.

This report gives a description of the electronic control-system for the RF-station of AmPS. The electronics form the connection between the computer-system and the hardware of the RF-station. Only the elements of the systems which are not described in the other NIKHEF-reports are here discussed in detail. (author). 7 figs.

27091 (ORNL/FTR–4299) **Travel to attend symposium on swift heavy ions in matter, a conference on electrostatic accelerators and associated boosters and a conference on applications of nuclear techniques: Foreign trip report, May 16–June 21, 1992.** Alton, G.D. Oak Ridge National Lab., TN (United States). 6 Jul 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012810. Source: OSTI; NTIS (US Sales Only); GPO Dep.

To attend the Second International Symposium on Swift Heavy Ions in Matter and present an invited paper entitled "Computational

Evaluation of the Stripping Properties of a Plasma" and a contributed paper entitled "A Scaled Sigmund Theory Model for Determining Sputter Ratios." To hold discussions with personnel at the CERN ISOLDE facility concerning operation of ISOLDE sources and procedures utilized at CERN for servicing and handling radioactively contaminated source components. To attend the Sixth International Conference on Electrostatic Accelerators and Associated Boosters and present two contributed papers entitled "Performance Characteristics of a Multiple-Sample Cesium Sputter Positive/Negative Ion Source," and "Selection and Design of the Oak Ridge Radioactive Beam Facility ISOL/Target Ion Source," and an invited paper entitled "Performance Characteristics of a Simple, High-Efficiency, Negative Surface Ionization Source." To attend the Third International Conference on Applications of Nuclear Techniques and present an invited paper entitled "Ion Sources for Use in Nuclear, Analytical, and Industrial Applications."

27092 (ORNL/FTR–4307) **Travel to France for a large experiment at the GANIL accelerator facility: Foreign trip report, June 10–24, 1992.** Beene, J.R.; Varner, R.L. Jr. Oak Ridge National Lab., TN (United States). 13 Jul 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012975. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this travel was to make preparation for a large ORNL-led experiment to be run at GANIL in late 1992. This experiment is part of a series of four experiments to be run sequentially, which, through quite different in physics goals, use an almost identical physical layout. The specific tasks accomplished included participating in assembly and testing of detector hardware and electronics, design and implementation of the primary trigger, testing of the read-out systems, and a major contribution to the configuration and setup of the computer system.

27093 (SLAC-PUB–6098) **Design of laser-Compton spot size monitor.** Shintake, T. (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Hayano, H.; Hayakawa, A.; Ozaki, Y.; Ohashi, M.; Yasuda, K.; Waltz, D.; Wagner, S.; Burke, D. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-920706–54: International conference on high energy accelerators, Hamburg (Germany), 20-24 Jul 1992). Order Number DE93015599. Source: OSTI; NTIS; INIS; GPO Dep.

A new diagnostic method for measuring transverse size of electron beam by nondestructive interaction of Compton scattering of laser beam has been proposed. A first model of this spot size monitor is under construction for the FFTB – SLAC experiment, in order to measure the electron beam size of 60 nanometer vertical by 1 micrometer horizontal, using Nd: YAG-laser of 1.064 μm wavelength. In this paper, the design of the system, and essential and practical engineering problems are discussed.

27094 (SLAC-PUB–6130) **Experience with a radio frequency gun on the SSRL Injector Linac.** Weaver, J.N.; Genin, R.D.; Golceff, P.; Morales, H.; Sebek, J. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Apr 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-930511–163: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015600. Source: OSTI; NTIS; INIS; GPO Dep.

A-SSRL/Varian-Associates-built, one-and-a-half cavity microwave, thermionic-cathode gun has operated on the SSRL Injector Linac reliably without changing the cathode for over 10,000 hours, with no significant decrease in emission. Thus, for a pulsed electron beam, with a maximum of 0.5 A peak at 2 to 3 MeV from a 3.5 MW peak rf pulse of 2 μs pulse width at 10 pps, the apparent but small amount of back bombardment of the cathode has been tolerable. Use of a bunch-compression alpha magnet and a stripline chopper after the gun produces the required S-band 3 to 5 microbunches of electrons for injection into a standard 10-m-long linac and on into a booster synchrotron, which in turn is used to fill SPEAR. Component limitations and operating characteristics of the gun and the linac's rf system are discussed.

27095 (SLAC-PUB–6131) **Pulse modulator developments in support of klystron testing at SLAC.** Koontz, R.F.; Cassel, R.; de Lamare, J.; Ficklin, D.; Gold, S.; Harris, K. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Apr 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-930511–165: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015603. Source: OSTI; NTIS; INIS; GPO Dep.

Several families of high power klystrons in S- and X-Band are being developed in the Klystron Laboratory at SLAC. To support these developments, a number of new pulse modulators are being designed from scratch, or upgraded from existing laboratory test modulators. This paper outlines the modulator parameters available in the SLAC Klystron Laboratory, and discusses two new modulators that are under construction.

27096 (SLAC-PUB–6134) **Requirements for linear collider instrumentation.** Ross, M. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9305216–1: 1. European workshop on beam instrumentation and diagnostics for particle accelerators, Montreux (Switzerland), 3-5 May 1993). Order Number DE93015253. Source: OSTI; NTIS; INIS; GPO Dep.

Instrumentation performs a critical role in the operation of a linear collider. New acquisition and data processing techniques are required for feedback, tuning procedures and performance monitoring. For example, many collider systems are initially tuned using complex bootstrap procedures whose convergence rate will depend on the speed and performance of several instrumentation systems. Furthermore, mechanical and electrical tolerances are computed assuming the success of this process. In this paper we review the performance of specific instrumentation systems, wire scanners and beam position monitor based feedback, at the SLAC Linear Collider (SLC). Particular attention is paid to the application the lessons learned at SLC will have for future Linear Colliders.

27097 (SLAC-PUB–6138) **Proposal for a feasibility study of very large aperture quadrupole magnets.** Bjorken, J.D. (Stanford Linear Accelerator Center, Menlo Park, CA (US)); McDonald, K.T. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9306176–1: Workshop on physics at current accelerators and the supercollider, Argonne, IL (United States), 2-5 Jun 1993). Order Number DE93015254. Source: OSTI; NTIS; INIS; GPO Dep.

The authors seek expert assistance in performing a feasibility study for quadrupole magnets with inner radius at least 80 cm, field at that radius of at least 1.5 Tesla, and field integral at that radius of at least 3 Tesla-m. These magnets would be used as the spectrometer magnets in hadron-collider experiments that emphasize relatively low transverse momentum and large angular coverage, such as studies of B physics and of a variety of physics topics in the far-forward direction. The magnets would preferably be superconducting, but conventional construction may be considered as well. Should the magnets be deemed feasible, the authors then seek to initiate an R and D program to construct a prototype.

27098 (SLAC-PUB–6142) **Design of the detuned accelerator structure.** Wang, J.W.; Nelson, E.M. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-930511–166: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015604. Source: OSTI; NTIS; INIS; GPO Dep.

This is a summary of the design procedure for the detuned accelerator structure for SLAC's Next Linear Collider (NLC) program. The 11.424 GHz accelerating mode of each cavity must be synchronous with the beam. The distribution of the disk thicknesses and lowest synchronous dipole mode frequencies of the cavities in the structure is Gaussian in order to reduce the effect of wake fields. The finite element field solver YAP calculated the accelerating mode frequency and the lowest synchronous dipole mode frequency for various cavity diameters, aperture diameters and disk thicknesses. Polynomial 3-parameter fits are used to calculate the

dimensions for a 1.8 m detuned structure. The program SUPERFISH was used to calculate the shunt impedances, quality factors and group velocities. The RF parameters of the section like filling time, attenuation factor, accelerating gradient and maximum surface field along the section are evaluated. Error estimates will be discussed and comparisons with conventional constant gradient and constant impedance structures will be presented.

27099 (SLAC-PUB–6152) **The Final Focus Test Beam laser referene system.** Bressler, V.E.; Ruland, R.E. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-930511–117: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015605. Source: OSTI; NTIS; INIS; GPO Dep.

The original design for the SLAC linac included an alignment reference system with 270 diffraction gratings situated along the 3000 meter linac. These gratings have provided SLAC with a global reference line repeatable to within 200 micro meters. For the Final Focus Test Beam, this laser system has been extended and 13 new diffraction gratings have been installed. Improvements targets and the availability of new instruments allows us to evaluate the performance of the laser reference system at the 510 micro meter level. An explanation of the system and the results of our evaluation are presented.

27100 (SSCL-Preprint–213) **Design and performance of a new 50 mm quadrupole magnet for the SSC.** Spigo, G.; Cunningham, G.; Goodzeit, C.; Orrell, D.; Turner, J.; Jayakumar, R. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–44: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014078. Source: OSTI; NTIS; INIS; GPO Dep.

A superconducting quadrupole model magnet with a 50 mm aperture and a gradient of 190 T/m, in operation at 4.35 K and 6500 A, has been designed, built and tested at the SSC. This accelerator magnet is expected to have application in the interaction regions of the collider main rings. Its dipole-type stainless steel collars with mated self-aligning pole spacers were a major innovation in design. The model had stringent requirements on field quality and a conservative 21% current margin. The first two articles have now demonstrated satisfactory quench performance over several thermal cycles, reaching plateau at approximately 8660 A with minimal training. This paper is a brief sketch of the design and preliminary results on the first model. Fabrication and testing are described in other papers of this conference.

27101 (SSCL-Preprint–214) **The accelerator systems string test: Objectives, problems, results, anecdotes, and reflections.** Dombeck, T. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–27: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014166. Source: OSTI; NTIS; INIS; GPO Dep.

The Accelerator System String Test (ASST) was a congressionally mandated milestone for the Superconducting Super Collider Laboratory (SSCL) to demonstrate powered operation of a half-cell of industrially-fabricated collider magnets before mass production could begin. In this paper I describe the installation of the string components and the results from the full-powered tests of the magnet string, consisting of five dipole magnets having an aperture of 50 mm and a single quadrupole having an aperture of 40 mm. Power and cryogenic connections were made to the string through spool pieces that were prototypes for SSC operations. The string was cooled to cryogenic temperatures in early July, 1992 and power tests were performed at progressively higher currents up to the nominal SSC operating point near 6500 Amperes.

27102 (SSCL-Preprint–218) **Integrating PAW, a graphical analysis interface to Sybase.** Fry, A.; Chow, I. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–35: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014172. Source: OSTI; NTIS; INIS; GPO Dep.

The program PAW (Physics Analysis Workstation) enjoys tremendous popularity within the high energy physics community. It is implemented on a large number of platforms and is available to the high energy physics community free of charge from the CERN computing division. PAW combines extensive graphical display capability (HPLOT/HIGZ), with histogramming (HBOOK4), file and data handling (ZEBRA), vector arithmetic manipulation (SIGMA), user defined functions (COMIS), powerful function minimization (MINUIT), and a command interpreter (KUIP). To facilitate the possibility of using relational databases in physics analysis, we have added an SQL interface to PAW. This interface allows users to create PAW N-tuples from Sybase tables and vice versa. We discuss the implementations below.

27103 (SSCL-Preprint–222) **Experimental strength verification of SSC cryogenic transfer line internal suspension system.** Stifle, K.; Zhang, B. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–26: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014167. Source: OSTI; NTIS; INIS; GPO Dep.

A transfer line system and support structure has been proposed by Zhang and Stifler and Zhang. The support structure uses three composite (G-10) plates to support the seven cryogenic lines. The cryogenic lines range in temperature from 80 K to 4 K. There are two 80 K nitrogen lines, two 20 K vapor helium lines, and three 4 K helium lines. The 80 K lines are attached to one plate, the 20 K lines are attached to another plate and the 4 K lines are attached to the last plate. Stainless steel rods are used to connect the plates to each other. This arrangement results in essentially three different temperature levels: an 80 K plate, a 20 K plate, and a 4 K plate. There are three different support structures; an elbow support, a longitudinal support, and a radial support. The main difference between the structures is the thickness of the plates. The elbow support is the thickest because it must carry the largest load and the radial support is the thinnest because it carries the lightest load. There are slight differences in the 80 K plates of each support but the 4 K and 20 K plates remain virtually unchanged except for the thickness. The 80 K plate of the elbow support has more "tabs" which are used to attach it to the vacuum vessel than the 80 K plate of the longitudinal support. The 80 K plate of the radial support is not attached to the vacuum vessel but has rollers which allow it to move as the tubes expand and contract with temperature changes. Only the elbow and longitudinal supports were tested.

27104 (SSCL-Preprint–224) **Heat leak measurements and thermal modeling of a mechanical support for a SSC beam tube liner.** Maddocks, J.; Zbasnik, J.; Yuecel, A.; Spidle, R. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–38: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014169. Source: OSTI; NTIS; INIS; GPO Dep.

Hydrogen desorbed from the beam tube of the super collider by synchrotron radiation may adversely affect the luminosity lifetime of the proton beam. One solution to this problem is to place a distributed cryopump within the beam tube which will pump desorbed gasses. Such a cryopump can be effected by attaching cryosorber to the cold (4 K) magnet bore tube. A concentric tube, or liner, centered within the magnet bore tube shields the cryosorber from the synchrotron radiation, and becomes the beam tube. By perforating a fraction of the liner surface with small (on the order of 1–3 mm) holes, the liner/cryosorber assembly becomes a distributed pump. The liner temperature may be allowed to equilibrate at a temperature close to that of the 4 K bore tube. However, actively stationing the liner at 80 K is of interest because the synchrotron radiation heat can then be deposited in the liquid nitrogen system.

This, at least partially, decouples the allowable beam current from the helium cryogenic system. Active control is accomplished by means of 80 K helium flowing through a trace tube attached to the outside of the liner.

27105 (SSCL-Preprint–232) **The thermal behavior of an SSC magnet in an unconditioned outdoor environment.** Pletzer, R. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–28: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014165. Source: OSTI; NTIS; INIS; GPO Dep.

The superconducting coils of the SSC magnets are subjected to potentially harmful warm temperatures during transportation and storage operations in certain outdoor environments. A realistic, harmful operating environment to which a magnet could be subjected at some point in the SSC construction would occur in the scenario in which an uncovered magnet remains outdoors during a hot, bright summer day, without environmental conditioning or protection for an extended period. Such a scenario could occur during a transportation truck breakdown, or if a magnet were left outside awaiting entry to the construction shaft over a weekend, for example. The magnet would be subjected to elevated ambient temperatures and solar radiation which could heat the magnet and raise the coil and bus assembly at some location to a temperature greater than the 32.2 °C (90°F), at which the B-stage epoxy used in the coil ground plane insulation is thought to weaken. A thermal analysis of an FNAL 50mm Dipole style magnet under such a hypothetical operating condition was conducted to predict the maximum coil temperature rise and rate of rise during such a scenario.

27106 (SSCL-Preprint–233) **A study of structural integrity of the SSC magnet six-strut support system.** Chang, C.; Chen, S.; Jalloh, A.; Martin, D. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–30: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014161. Source: OSTI; NTIS; INIS; GPO Dep.

In the preliminary SSC design configuration, the overall magnet cryostat assembly is supported externally at three mechanical positioning points by two stands attached to the collider tunnel floor. Differing from the SSC design concept, a well designed and simply operated six-strut support system has been used at the Lawrence Berkeley Laboratory/Advanced Light Source (LBL/ALS) successfully. In brief, the struts are equipped with ball joints at each end, and the struts are so arranged in a manner of three vertical, two lateral, and one longitudinal directions that provide the minimum constraints necessary to support the ALS system in the accelerator tunnel. Because the struts are made of differential screws which are adjustable in length, the six-strut system also provides minute controllability for cryostat alignment purposes. Also, the six-strut support system keeps the magnet from direct exposure to the accelerator tunnel floor which may lower the potential risks for the magnet from the ambient vibration and ground motion. Because of the mentioned merits, the six-strut support configuration is being considered as an alternative to the SSC magnet support system. This paper presents a qualitative study for the structural integrity of the SSC six-strut support system. Several six-strut design configurations are investigated.

27107 (SSCL-Preprint–234) **A quasi-3D model to predict temperature distribution in SSC magnets due to 3D heat loads.** Archer, B. (Superconducting Super Collider Lab., Dallas, TX (United States)); Schermer, R.; Snitchler, G.; Kohli, H. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–50: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014249. Source: OSTI; NTIS; INIS; GPO Dep.

Hadronic and electromagnetic cascades in the vicinity of the interaction regions deposit energy into the final focusing superconducting magnets as a heat load that varies radially, azimuthally, and axially. The helium used to cool the magnets convects heat axially as it flows, thus, the temperature distribution at any point in the magnet depends on the previous history of the helium. A detailed map of the temperature distribution of the superconducting coils is required to determine the cooling is sufficient to prevent the magnet from quenching. A three-dimensional model is required to analyze the magnet temperature distribution due to the 3D heat load and the axial helium flow A 3D finite element thermal model of a 15 m magnet is not practical due to the large amount of CPU time that would be required. Therefore, a quasi-3D model has been developed that divides the magaet into a large number of segments axially, then calculates the temperature distribution for each segment using a 2D finite element model with boundary conditions derived from the previous segment by conservation of energy.

27108 (SSCL-Preprint–236) **Data acquisition and controls for the SSCL ASST, Phase 1.** Bork, R.; Christiansen, M.; Faught, E.; Goetze, K.; Haenni, D.; Lee, S.; Murray, D.; Wang, J.; Williams, E.; Wylie, M.; Zatopek, J. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–33: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014076. Source: OSTI; NTIS; INIS; GPO Dep.

The Accelerator Systems String Test (ASST) was a major milestone in SSCL R&D. Phase I demonstrated that the smallest repetitive sequence of bending magnets (a half cell) could be installed, leak checked, cooled to liquid helium temperatures, energized, and safely quenched. To support this activity, a control system had to be developed to operate and monitor cryogenic systems in the string, along with LCW and vacuum systems. Also, since this is a test facility, the magnet systems were heavily instrumented to provide sufficient data to confirm that design requirements were met, that the system was operating safely and as expected, and allow further design studies necessary for the construction of the SSC. This required the design and implementation of an acquisition system capable of collecting relatively large amounts of data, at various data rates, and presenting this data both to operations personnel and to a database for off-line analysis. In this paper, we describe the design, implementation, and operation of the data acquisition system and controls employed on the ASST.

27109 (SSCL-Preprint–242) **Design and results of the radio frequency quadrupole RF system at the Superconducting Super Collider Laboratory.** Grippe, J. (Superconducting Super Collider Lab., Dallas, TX (United States)); Marsden, E.; Marrufo, O.; Regan, A.; Rees, D.; Ziomek, C. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–53: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014254. Source: OSTI; NTIS; INIS; GPO Dep.

The Superconducting Super Collider Laboratory (SSCL) and the Los Alamos National Laboratory (LANL) entered into a joint venture to design and develop a 600 kW amplifier and its low-level controls for use in the Radio-Frequency Quadrupole (RFQ) accelerating cavity of the SSC. The design and development work has been completed. After being tested separately, the high power amplifier and low level RF control system were integrated and tested on a test cavity. Results of that tests are given. Tests were then carried out on the actual RFQ with and without the presence of the accelerated beam. Results of these tests are also given, along with the phase and amplitude information.

27110 (SSCL-Preprint–246) **FDDI experience at the SSCL.** Jaffe, M. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–15: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014132. Source: OSTI; NTIS; INIS; GPO Dep.

The Physics Detector Simulation Facility (PDSF) is an assemblage of UNIX/RISC workstations and servers which use LAN

networking components and standards in a unique way. The PDSF is configured using FDDI much like an internal system bus to a computer system and thus serves as the foundation for the entire PDSF system. This paper will describe the utilization of FDDI in the system, system monitoring, and the interfacing of the PDSF to the local site LAN and WAN environment.

27111 (SSCL-Preprint–247) **Preliminary results from a study of collar lamination variation in SSC Prototype Dipole Magnets.** Gattu, R.; Brown, G.M.; Pollock, D. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–37: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014170. Source: OSTI; NTIS; INIS; GPO Dep.

The collar laminations used in SSC Prototype Collider Dipole Magnets determine the, volume within which the magnet coils are constrained after collaring and keying. The uniformity and symmetry of the inside volume of the collars along the length of the magnet may have a significant influence on the field quality of the finished assembly. This pap describes an on-going Statistical Quality Control study of collar lamination dimension variation being performed by SSCL Magnet Systems Division Quality Assurance. Samples of collars have been measured using a coordinate measuring machine evaluate manufacturing process capability as well as the overall uniformity of the inven population of collar laminations. The collar data will be used to predict variation in the coil assembly center and radius for inner and outer top-bottom, left-right coil combinations well as pole angles. Collar results will be combined with azimuthal coil size measure melits part of a manufacturing cause and effect model for predicting axial geometric multipoles ba on the observed mechanical variation. This work focuses on Prototype Collider Dipole Magnet DCA 102 currently being built at the SSCL MDL in Waxahachie, Texas. This magnet is being made on the same coil curing and collaring mold cavities that were used for the DCA 300 series magnets built at FNAL in 1991–1992 and which were later used in the 1992 Accelerator Systems String Test (ASST). The collars are part of the same procurement used for the DCA300 series magnets.

27112 (SSCL-Preprint–248) **MTL distributed magnet measurement system.** Nogiec, J.M.; Craker, P.A.; Garbarini, J.P.; Ilushin, V.; Ivey, J.C.; Lambert, J.D.; Li, Wei-chuan. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–41: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014311. Source: OSTI; NTIS; INIS; GPO Dep.

The Magnet Test Laboratory (MTL) at the Superconducting Super collider Laboratory will be required to precisely and reliably measure properties of magnets in a production environment. The extensive testing of the superconducting magnets comprises several types of measurements whose main purpose is to evaluate some basic parameters characterizing magnetic, mechanic and cryogenic properties of magnets. The measurement process will produce a significant amount of data which will be subjected to complex analysis. Such massive measurements require a careful design of both the hardware and software of computer systems, having in mind a reliable, maximally automated system. In order to fulfill this requirement a dedicated Distributed Magnet Measurement System (DMMS) is being developed.

27113 (SSCL-Preprint–251) **Cryogenic characteristics of the SSC Accelerator Systems String Test (ASST).** Burgett, W.; Franks, D.; Kraushaar, P.; Levin, M.; McAshan, M.; McInturff, A.; Pletzer, R.; Revell, D.; Robinson, W.; Saladin, V.; Shuy, G.; Smellie, R.; Weisend, J.G. II. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–39: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014168. Source: OSTI; NTIS; INIS; GPO Dep.

A series of static and dynamic tests of the ASST were conducted from July 1992 to the present. These tests included heat leak measurements, as well as, temperature and pressure profiles obtained during quench testing of the string. An accurate assessment of heat leak measurements of collider components requires a stable thermal environment with the minimization of end effects. The string test provides the ideal static environment necessary to conduct these measurements. This report summarizes the results of the heat leak measurements conducted on the cold mass, 20K, and 80K shields of the dipoles used in the ASST assembly. We also report on the rapidly changing temperatures and pressures recorded during the string quench tests.

27114 (SSCL-Preprint–257) **Beam instrumentation and precision timing equipment for the SSC accelerator complex.** Webber, R. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–42: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014074. Source: OSTI; NTIS; INIS; GPO Dep.

This article is intended to provide an introduction to the beam instrumentation systems and the precision timing system of the SSC Laboratory. The Beam Instrumentation Department of the SSC Accelerator Systems Division is responsible for the design of these systems for the Collider rings and the injecter accelerators. Status and plans are briefly described. The signal sensors and low level signal processing electronics of the beam instrumentation systems are the eyes and ears into the world of the proton beam. Situated between that invisible beam and the accelerator operator, they monitor and measure the behavior and performance of the otherwise intangible protons as they are guided and accelerated through the Linac and the injecter synchrotrons, and finally stored in the Collider rings. The precision timing system provides the vital time references required to synchronize critical accelerator hardware functions, beam manipulations, and data acquisition over the geographical extent of the Supercollider complex. Several fundamental timing signals are distributed over dedicated fiber optic networks. Special programmable electronic modules process the timing information to provide precisely timed outputs to control the many accelerator systems and devices.

27115 (SSCL-Preprint–266) **Design and analysis of the Collider SPXA/SPRA spool piece vacuum barrier.** Cruse, G.; Aksel, G. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–32: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014176. Source: OSTI; NTIS; INIS; GPO Dep.

A design for the Collider SPXA/SPRA spool piece vacuum barrier was developed to meet a variety of thermal and structural performance requirements. Both composite and stainless steel alternatives were investigated using detailed finite-element analysis before selecting an optimized version of the ASST SPR spool vacuum barrier design. This design meets the structural requirements and will be able to meet the thermal performance requirements by using some newer thermal strapping configurations.

27116 (SSCL-Preprint–268) **Technical status of SSC RF amplifier and accelerating cavity systems.** Ferrell, J.; Rogers, J.; Coleman, P.; Curbow, J.; Mynk, J. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–31: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014175. Source: OSTI; NTIS; INIS; GPO Dep.

An overview of the design status of each RF amplifier system is presented and potential opportunities for industry involvement are identified. Specifically, brief descriptions of the LINAC, LEB, MEB, HEB, and Collider RF Amplifier systems are presented, as well as the LEB and MEB cavities. Status in the LINAC ranges from an RFQ Amplifier being operational at the SSC to procurement of subsystems still pending. The LEB prototype system is in tests at

SSC, and the MEB prototype system is has begun, and desip of the MEB RF system will begin in 1994.

27117 (SSCL-Preprint–271) **The design and development of a single piece, sandwhich tube coldmass support post for the SSC Collider Dipole Magnets.** Ahmad, A. (Superconducting Super Collider Lab., Dallas, TX (United States)); Mehle, G. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–47: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014252. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the design and development of the single piece, carbon/epoxy syntactic core sandwich tube support post concept for the 13-m and 15-m Collider Dipole Magnet (CDM). The engineering studies focus on balancing the structural and thermal requirements for the structure, and most importantly the implicit requirement of "Designing for Producibility." Results from these studies, as well as the development program plan, will be presented.

27118 (SSCL-Preprint–275) **Design of a model dipole magnet for the SSC High Energy Booster.** Hassan, N.; Couzens, K.; Dwyer, S.; Jaisle, A.; Jayakumar, R.; Krishnamurthy, S.; Mihelic, R.; Phillips, S.; Puri, R.K.; Sarna, K.; Snitchler, G.; Venkatraman, V. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–40: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014134. Source: OSTI; NTIS; INIS; GPO Dep.

A superconducting model dipole magnet has been designed to serve as a vehicle in an R&D program to develop a dipole magnet for potential use in the SSC High Energy Booster. The objective has been to use the Brookhaven, National Laboratory (BNL) and Fermi National Accelerator Laboratory (FNAL) 50 mm aperture dipole designs to the maximum possible extent for design of a dipole magnet with the same size aperture and a field intensity of 6.67 T. Objectives of this program have also included an evaluation of magnet cross section designs which provides in margin and includes a field quality iteration on BNL and FNAL dipole designs. In this paper the 2D magnetic and mechanical design of the cold mass in conceptual and detail form is presented.

27119 (SSCL-Preprint–278) **Dynamic analysis of six-strut supporting system for accelerator magnet.** Leung, K.K. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–28: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014245. Source: OSTI; NTIS; INIS; GPO Dep.

A six-strut magnet support system designed by Lawrence Berkeley Laboratory (LBL) is considered as an alternative to the current SSC magnet support system. The LBL designed a six-strut support system based on the kinematics mount concept that is generally used in the optical and the laser communication industries. The six-strut system is defined by six static degrees of freedom that constrain a point in space with no redundant restraint. Adjustment of any strut's length means redefining the translation or rotational degree of freedom of the mounting point and produces the desirable movement of the magnet system. The accurately operated six-strut mounting system used in the Berkeley's Advance Light Source (AILS) magnet support is able to maintain the magnet system structural integrity to survive a 7 earthquake, position the magnet to high tolerances, have a small footprint, simple to operate, and adjust to a micron level of accuracy. Though finite element simulation has been used for years in safety analysis, such as seismic dynamic response analysis in nuclear reactor and piping supports, in late 1970, it was employed in the dynamic study for a magnet system in Lawrence Berkeley Laboratory in the late eighties. The modeling methodology developed in LBL for the six-strut system desip, especially for the critical mounting joint design under dynamic loads, is presented in this paper and may be employed for prospective SSC accelerator magnet supporting system design.

27120 (SSCL-Preprint–281) **Databases for analysis of superconducting cable manufacturing.** Bardos, V.A.; Coleman, E.S.; Erdmann, M.J.; Jones, B.A.; Kozman, K.S.; Little, D.J.; Seuntjens, J.M. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–49: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014250. Source: OSTI; NTIS; INIS; GPO Dep.

Starting in September 1991, eight cable vendors began fabricating approximately 10,000 kg each of Inner or Outer superconducting cable for the Superconducting Super Collider's (SSC) cable Vendor Qualification Program (VQP). This program, designed to identify vendor's for competition for the supplying of superconducting cable for the manufacture of SSC magnet systems, will conclude in June, 1993. The conductor database was developed as an integral part of the VQP in order to analyze the origins of variation within the conductor fabrication processes, and develop and implement control procedures to minimize such variations. In addition, the database development effort will provide a direct link to the MAGCOM database system being implemented by the Test and Data Management Department of the Magnet Systems Division of the SSCL.

27121 (SSCL-Preprint–284) **Optical measurement of SSC ARC quadrupole cold mass location.** Corbett, C. (Superconducting Super Collider Lab., Dallas, TX (United States)); Ketcham, L.; Pletzer, R.; Shapiro, S.; Viola, R.; Walton, J.; Wilkins, R.; Bagwell, S.; Barnes, W. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–18: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014130. Source: OSTI; NTIS; INIS; GPO Dep.

The operation of the collider requires that the ARC quadrupoles' beam center and rotational configuration be held to the tight tolerances of 0.2 mm rms and 0.5 mradian rms. The design of the collider superconducting magnets prevents direct access to the cold mass during operation. As a result, cold mass position is inferred from the relationship established by warm measurements relative to a secondary fiducial located on the vacuum vessel and an offset (warm to cold correlation) to account for the position change for a cold magnet. There is concern am the relation of these fiducials to the magnet centerline may change unpredictably due to the temperature drop required for superconducting operation or due to long term creep. This paper reports on a design that will allow visual observation of the cold mass shell position and roll orientation under cold as well as warm conditions. This paper will present a description of the window configuration and status/results of tests which have been conducted warm and cold in the single magnet configuration. Future testing in a multiple string configuration is being considered.

27122 (SSCL-Preprint–285) **Conceptual design studies for a He II cooled Low Beta Quad IR Magnets.** Baritchi, D.; Corbett, C.; Jalloh, A.; Mokhov, N.V.; Schermer, R.; Steining, R. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–51: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014248. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses the results of the Cryostat Design Group's effort on the Conceptual Studies of the Low Beta Quad Magnets (LBQ) cooled by superfluid Helium (He II). The conclusion of this study is that the "adapted CERN' He H cooling design does present a satisfactory system for cooling the LBQ magnet interaction region (IR) radiation heat loads; however, for the increased luminosity heat load some research on the cable insulator is required to achieve an effective thermal connection between the outer coil and the He II bath. The LBQ magnets are the final four magnets on either side of the IR detector. These four magnets are

named Q1, Q2A, Q2B, and Q3, reaching outward from the interaction point. All magnets have a 50-mm magnet bore and produce a gradient of 193 T/m. Magnetic lengths were all-considered to be 15 meters for the purposes of this study. Radiation from the proton-proton collisions results in a significant heat deposition on the LBQs which is most severe for Q1 and least severe for Q2 and Q3. This is reduced with a 25-mm aperature, 3 meter long steel collimator installed upstream of Q1. Total heat to be removed from Q1 is 47 watts at the baseline luminosity which presents the most severe design challenge.,V Maximum local heat deposition is 0.25 mw/g. The average value for the inner coil compared to the worst 2.5-meter length is 1.01 w/m average compared to 2.24 w/m maximum. The thermal model results were generated for both the maximum heat loads and the average heat load. The design loads for the 10^{34} luminosity design can be obtained by multiplying the above values by ten. The assumption has been made that a cooling collimator is installed inside the beam tube along the entire length of the magnets to absorb one-half of the total heat load for the increased luminosity design.

27123 (SSCL-Preprint–288) **Building the repositories to serve.** Lersch, D. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–90: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014100. Source: OSTI; NTIS; INIS; GPO Dep.

The project to design and build the Superconducting Super Collider (SSC) Laboratory also includes the exciting opportunity to implement client/server information systems. Lab technologists were eager to take advantage of the cost savings inherent in the open systems and a distributed, client server environment and, at the same time, conscious of the need to provide secure repositories for sensitive data as well as a schedule sensitive acquisition strategy for mission critical software. During the first year of project activity, micro-based project management and business support systems were acquired and implemented to support a small study project of less than 400 people allocating contracts of less than $1 million. The transition to modern business systems capable of supporting more than 10,000 participants (world wide) who would be researching and developing the new technologies that would support the world's largest scientific instrument, a 42 Tevatron, superconducting, super collider became a mission critical event. This paper will present the SSC Laboratory's strategy to balance our commitment to open systems, structured query language (SQL) standards and our success with acquiring commercial off the shelf software (COTS) to support our immediate goals. Included will be an outline of the vital roles played by other labs (Livermore, CERN, Brookhaven, Fermi and others) and a discussion of future collaboration potentials to leverage the information activities of all Department of Energy (DOE) funded labs.

27124 (SSCL-Preprint–289) **Systematic error analysis of rotating coil using computer simulation.** Li, Wei-chuan; Coles, M. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–72: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93016186. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes a study of the systematic and random measurement uncertainties of magnetic multipoles which are due to construction errors, rotational speed variation, and electronic noise in a digitally bucked tangential coil assembly with dipole bucking windings. The sensitivities of the systematic multipole uncertainty to construction errors are estimated analytically and using a computer simulation program.

27125 (SSCL-Preprint–300) **Comparisons of processes and performance of SSC-VQP material.** Seuntjens, J.; Clark, F.; Erdmann, M.; Coleman, E.; Jones, B. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–89: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014102. Source: OSTI; NTIS; INIS; GPO Dep.

The Superconducting Super Collider's (SSC) cable Vendor Qualification Program (VQP) will end in FY 1993. At the time of this writing, all 8 vendors involved in this program have demonstrated capability to fabricate conductor which meets SSC specifications. The magnet vendors have hard choices to make in calendar year 1993 in deciding which cable vendors will make the production cable. It is well accepted that because of requirements of magnet uniformity, that only one vendor will be chosen for dipole Inner cable, one vendor for dipole Outer cable, and one vendor for quadrupole Outer cable. The production quantities are nominally 500, 500, and 200 metric tonnes, respectively. Among the many deciding factors are a technically sound production process, process control, and production quantity capability of each cable vendor. Qualified vendors will have proven their technical process and process control is adequate for production quantities. This paper is part of ongoing effort to provide technical information for the magnet vendor's decision making process. Some of the Phase IB process data is summarized and well as results of a portion of the materials characterization performed at the SSC Laboratory. Key process and final product parameters for each cable vendor are compared without identifying specific vendor's process detail.

27126 (SSCL-Preprint–308) **Thermal analysis of the SSC beam scraper.** Tran, N.; Dao, B. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–48: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014251. Source: OSTI; NTIS; INIS; GPO Dep.

When a particle beam impacts a beam scraper, heat is generated resulting in a rise in the temperature of the material. The maximum temperature rise should be kept to a minimum in order to maintain scraper efficiency and performance. In this paper the results of a thermal analysis of a scraper are presented.

27127 (SSCL-Preprint–312) **On coupling impedances of pumping holes.** Kurennoy, S. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–120: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014253. Source: OSTI; NTIS; INIS; GPO Dep.

Coupling impedances of a single small hole in vacuum-chamber walls have been calculated at low frequencies. To generalize these results for higher frequencies and/or larger holes one needs to solve coupled integral equations for the effective currents. These equations are solved for two specific hole shapes. The effects of many holes at high frequencies where the impedances are not additive are studied using a perturbation-theory method. The periodic versus random distributions of the pumping holes in the Superconducting Super Collider liner are compared.

27128 (SSCL-Preprint–328) **Beam loss handling at the SSC.** Baishev, I.S.; Drozhdin, A.I.; Mokhov, N.V. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–205: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93016243. Source: OSTI; NTIS; INIS; GPO Dep.

A scraper/collimation system is required to localize the beam loss in the Collider of the Superconducting Super Collider to a few predefined locations and by doing so to minimize the irradiation of superconducting magnets, to sustain favorable background conditions in the Interaction Regions (IR), and to reduce the impact of radiation on other equipment, personnel, and the environment. Results of full-scale simulation are presented for various systematic and accidental beam loss.

27129 (SSCL-Preprint–329) **Dealing with abort kicker prefire in the Superconducting Super Collider.** Drozhdin, A.I.; Baishev, I.S.; Mokhov, N.V.; Parker, B.; Richardson, R.D.; Zhou, J. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–61: International particle accelerator conference, Washington, DC (United

States), 17-20 May 1993). Order Number DE93014083. Source: OSTI; NTIS; INIS; GPO Dep.

The Superconducting Super Collider uses a single-turn extraction abort system to divert the circulating beam to a massive graphite absorber at normal termination of the operating cycle or in case of any of a number of predefined fault modes. The Collider rings must be designed to be tolerant to abort extraction kicker prefires and misfires because of the large circulating beam energy. We have studied the consequences of beam loss in the accelerator due to such prefires and misfires in terms of material heating and radiation generation using full scale machine simulations and Monte-Carlo energy deposition calculations. Some results from these calculations as well as possible protective measures for minimizing the damaging effects of kicker prefire and misfire are discussed in this paper.

27130 (SSCL-Preprint–337) **An engineering design study of the transfer bridge for the SSC SDC detector.** Western, J.L. (Superconducting Super Collider Lab., Dallas, TX (United States)); Tulk, G.W.; Dittert, L.I. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–59: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93016113. Source: OSTI; NTIS; INIS; GPO Dep.

The transfer bridge is a major structural installation component for the large detector proposed by the Solenoidal Detector Collaboration (SDC). The transfer bridge is the structural device that allows for installation of the Muon Forward Toroid (MFT) and calorimeter components into the Muon Barrel Toroid (MBT). This paper summarizes the design and construction of the SDC transfer bridge.

27131 (SSCL-Preprint–347) **Overview and status of beam instrumentation at the SSC.** Webber, R.C. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–65: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014081. Source: OSTI; NTIS; INIS; GPO Dep.

An overview of beam instrumentation requirements at the SSC and a status report on work progress is given. Small transverse emittance beams, ranging in energy from 30 KeV to 20 TeV, must be commissioned, measured, and diagnosed. Instrumentation plans and current design and development efforts for BPMs and other systems are presented. Monitors and electronics soon to be delivered for use in the Linac are described. Design of the Linac systems has been done with requirements and applications in the synchrotron in mind and thus should provide a basis for design of much of that hardware. The useful commonality of design across the machines is discussed.

27132 (SSCL-Preprint–348) **Conductor design for the GEM Detector Magnet.** Minervini, J.V. (Massachusetts Inst. of Tech., Cambridge, MA (United States). Plasma Fusion Center); Marston, P.G.; Smith, B.A.; Camille, R.J.; Piek, Z.S.; Vieira, R.F.; Titus, P.; Deis, G.; Martovetsky, N.; Reardon, P.J.; Stroynowski, R. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–58: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93016116. Source: OSTI; NTIS; INIS; GPO Dep.

Short communication. SHOWER COUNTERS/superconducting cables; SUPERCONDUCTING CABLES/design; SUPERCONDUCTING SUPER COLLIDER; SUPERCONDUCTING MAGNETS; TESTING; DESIGN

27133 (SSCL-Preprint–350) **The SSCL LINAC Control System.** Heefner, J.; Cuevas, C.; Hunt, S.; Murray, D.; Sage, J. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–204: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93016187. Source: OSTI; NTIS; INIS; GPO Dep.

Short communication. SUPERCONDUCTING SUPER COLLIDER/linear accelerators; LINEAR ACCELERATORS/computerized control systems; COMMUNICATIONS; COMPUTER NETWORKS

27134 (SSCL-Preprint–352) **Electron beam emittance monitor for the SSC.** Tsyganov, E.; Meinke, R.; Nexsen, W.; Kauffmann, S.; Zinchenko, A.; Taratin, A. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–121: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014244. Source: OSTI; NTIS; INIS; GPO Dep.

A nondestructive beam profile monitor for the Superconducting Super Collider (SSC) is presented using as a probe a low-energy electron beam interacting with the proton bunch charge. Results using a full Monte Carlo simulation code look promising for the transverse and longitudinal beam profile measurements.

27135 (SSCL-Preprint–354) **Status of the SSC LEB rf cavity.** Coleman, P.C. (Superconducting Super Collider Lab., Dallas, TX (United States)); Brandeberry, F.; Friedrichs, C.; Goren, Y.; Grimm, T.; Hulsey, G.; Kwiatkowski, S.; Propp, A.; Taylor, L.; Walling, L.; Averbukh, J.; Karliner, M.; Petrov, V.; Yakovlev, S. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–40: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014271. Source: OSTI; NTIS; INIS; GPO Dep.

A tunable, high-accelerating-gradient cavity prototype has been designed and built for use in the rf system for the Low Energy Booster (LEB) at the Superconducting Super Collider (SSC). Testing of the cavity using one tuner cooling variant has been completed. This paper reports on results of low level, high level and tuning tests performed on the cavity. The tuner damaged during high power testing. Discussion of the is included.

27136 (SSCL-Preprint–357) **Collider bypass diode thermal simulations and measurements for the SSCL.** Rostamzadeh, C.; Tool, G. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–38: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014255. Source: OSTI; NTIS; INIS; GPO Dep.

Warm bypass diodes will be used as a component of a quench protection system to bypass an exponentially decaying current of 36 sec. time constant and peak current of 7000 A. Temperature excursions due to approximately 252 Kilo Ampere Sec. are studied using ANSYS, a finite element analysis program. A parabolic current waveform of similar energy but higher MIITs (1058 MIIT) was applied to the bypass circuit and temperature excursion was measured at various locations. The procedure of current waveform generation and thermal measurements is illustrated in this paper. A comparison of simulation technique with actual measurements confirms the accuracy of the bypass diode assembly model. This assembly is installed at the SSC half-cell string test facility and results are extremely encouraging.

27137 (SSCL-Preprint–359) **Accelerator Readiness Review process for the SSC Linac.** Tooker, J.F.; Benke, T.; Funk, L.W.; Oliphant, V. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–118: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014261. Source: OSTI; NTIS; INIS; GPO Dep.

As each accelerator of the SSCL is prepared for operation, it must have an Accelerator Readiness Review (ARR) in order to begin high power RF or beam operation. This review validates the Safety Analysis Report (SAR) and demonstrates to an independent review panel that (1) the systems and equipment are in place and have been fully tested with satisfactory results; (2) systems and equipment are covered as necessary by written procedures that

have been reviewed and approved; (3) those who carry out the activity are fully trained and qualified. The panel will then request that the SSCL Director give permission for operation. The Department of Energy must concur for operation to commence. The SSC Linac, a series of four accelerators, will be tested and commissioned in the Linac Tunnel in series starting in the fall of 1992 and ending in the spring of 1995. The Accelerator Readiness Review process will be described as it relates to the SSC Linac in order to support the staged commissioning.

27138 (SSCL-Preprint–360) **Preliminary testing of the LEB to MEB transfer kicker modulator prototype.** Pappas, G.C.; Askew, D.R. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–57: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014061. Source: OSTI; NTIS; INIS; GPO Dep.

The extraction kicker for the Low Energy Booster (LEB) is used to deflect a 12 GeV/c proton beam from the synchrotron into a transfer line. A kicker system of similar design is used to inject the beam from the transfer line into the Medium Energy Booster (MEB). The modulator requirements for these kicker systems are to deliver a pulse train of seven 1.6kA, 2.5 μs pulses at a pulse repetition frequency of 20 pps, every seven seconds for one hour. The impedance of the modulator is 12.5 ω, resulting in a charge voltage of 40 kV. The 10–90% rise time of the pulses is 20 ns, and the 1–99% fall time is 2 μs. The allowable pulse ripple is $\pm$1% of the peak current during the pulse, and $\pm$0.3% from pulse to pulse. The shot -to-shot timing jitter requirement is less than ns. This paper describes the design and performance of the prototype modulator which was fabricated to meet these specifications.

27139 (SSCL-Preprint–362) **A digital approach for phase measurement applied to delta-t tuneup procedure.** Aiello, G. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–39: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014272. Source: OSTI; NTIS; INIS; GPO Dep.

Beam energy and phase in a Linac are important parameters to be measured in order to tune the machine. They can be calculated by the time of flight of a beam bunch over a known distance between two locations, and by comparing the phase of a cavity to the beam phase. The phase difference between two signals must be measured in both cases, in order to get the information required. The electronics to be used for this measurement must meet stringent requirements: high bandwidth, good accuracy and resolutim have always been a challenge for classical analog solutions. A digital approach has been investigated, which provides a good resolution, accuracy independent on the phase difference value, good repeatability and reliability. Numerical analysis have been performed, showing the system's optimal performance and limitations. A prototype has been tested in the laboratory, which confirm the predicted performance, and proves the system's feasibility.

27140 (SSCL-Preprint–364) **RF systems engineering for the SSC collider rings.** Schaffer, G.; Coleman, P.; Mustaine, R.; Wallace, J.; Wang, X.; Zhao, Y.; Rogers, J. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–31: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014181. Source: OSTI; NTIS; INIS; GPO Dep.

Acceleration and storage of 70-mA proton beams in the 2 $\times$ 20 TeV Supercollider rings can be performed both with normalconducting as well as superconducting 360-MHz rf systems. A normalconducting accelerating structure would use 32 or 24 single-cell cavities per ring, operating with a mean gradient of 2–2.6 MV/m to generate the required peak voltage of 20 MV in the beam holding mode. Superconducting cavities would allow operation with mean gradients UP to about 5 MV/m, and tolerate higher transient beam loading due to nearly tenfold larger stored energy in the accelerating structure. A superconducting structure could consist of five pairs of single-cell resonators per ring, each pair being fed by a 250kW cw klystron amplifier. The use of 500-kW or 250-kW klystron amplifiers, six or eight per ring, would seem appropriate for feeding normalconducting structures. Provisions for feedforward and feedback(rf amplitude and phase) are included in the low-level rf system. Furthermore, active damping of undesired modes and corrections of bunch phase deviations are planned by means of auxiliary (broadband) rf systems.

27141 (SSCL-Preprint–374) **Bunch Shape Monitor for SSCL linac.** Hurd, J.W. (Superconducting Super Collider Lab., Dallas, TX (United States)); Arbique, G.M.; Crist, C.E.; Guy, F.W.; Leifeste, G.T.; Raparia, D.; Saadatmand, K.; Swenson, D.A.; Esin, S.; Feschenko, A.; Stepanov, A.; Mirzojan, A. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–58: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014060. Source: OSTI; NTIS; INIS; GPO Dep.

The Superconducting Super Collider Laboratory and the Institute for Nuclear Research ore collaboratively developing a Bunch Shape Monitor diagnostics for commission the SSCL linac. The Bunch Shape Monitor is designed to measure the intensity of beam as a function of time over the micro-bunch of the beam. Design resolution for the SSCL monitors is approximately 7 psec. The first monitor will operate at the fundamental frequency of 428 MHz and will be used to measure the output beam of the RFQ Linac. First available results will be presented and compared with predictions. Further development will allow the monitors to fit in a standard SSCL beam box and one will operate at the third harmonic of 428 MHz. Proposals to use the Bunch Shape Monitor to measure the longitudinal phase space distribution of the beam will be discussed.

27142 (SSCL-Preprint–380) **RF cavity for the Medium Energy Booster (MEB) for SSCL.** Yakoviev, V.P. (Budker Inst. of Nuclear Physics (Russian Federation)); Petrov, V.M.; Kwiatkowski, S.; Curbow, J.; Enegren, T.; Propp, A. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–60: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014064. Source: OSTI; NTIS; INIS; GPO Dep.

The RF cavity for the Medium Energy Booster (MEB) is required to accept beam from the low energy booster (LEB) at a momentum of 12 GeV/c (possibly 10 GeV/c) and accelerate it to 200 GeV/c. Each cavity must provide a maximum gap voltage of 250 kV, and must be tunable from 59.7 MHz to 59.96 MHz with a maximum sweep rate of 450 kHz/s. This requires a ferrite-tuned cavity with a high quality factor. A quarter-wave cavity was designed which meets these requirements while minimizing beam-loading problems (minimizes R/Q). This paper describes the design of this cavity, results from measurements of a corresponding cold model, and several proposed Higher Order Mode (HOM) damping system designs.

27143 (SSCL-Preprint–381) **The SSC RFQ-DTL matching section buncher cavities.** Enegren, T.; Combs, C.M.; Goren, Y.; Hayworth, M.D.; Ringwall, A.D.; Swenson, D.A. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–59: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014065. Source: OSTI; NTIS; INIS; GPO Dep.

The RFQ-DTL matching section of the SSCL Linear Accelerator matches the 2.5 MeV H^- beam from the RFQ into the acceptance of the 70 MeV Drift Tube Linac (DTL). To provide longitudinal phase space tuning, two rf buncher cavities with a resonant frequency of 427.617 MHz and with a maximum E_0TL of 160 kV are required. To meet the limited space requirements, it was decided to use double gap buncher cavities.

27144 (SSCL-Preprint–383) **Mechanical integration of an RF volume source and einzel lens LEBT to the SSC RFQ.** Valicenti, R.A.; Lenz, J.; Okay, N.C.; Plesea, L.; Saadatmand, K. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract AC35-89ER40486. (CONF-930511–130: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014263. Source: OSTI; NTIS; INIS; GPO Dep.

The Superconducting Super Collider (SSC) LINAC Injector is currently operating with an RF-driven volume ion source coupled with an einzel lens Low Energy Beam Transport (LEBT). The ion source, LEBT and beam diagnostics are integrated into a compact vacuum enclosure which is mounted to the ups endwall of the Radio Frequency Quadrupole (RFQ). Beam dynamic requirements imposed a minimum longitudinal of only 23.5 cm, thus creating a very challenging packaging problem. In addition, optimum beam matching to the RFQ specified a maximum gap of 1 cm between the LEBT and the entrance endwall face, thereby excluding the use of a bellows between the LEBT chamber and the RFQ. Vacuum system induced loads and vibrations are isolated from the beamline components by the use of a straddling frame which is an integral component of the vacuum system/support cart TWs paper will desirable some of the unique aspects of the mechanical design resulting from beam requirements, high gas load, availability of the vacuum system and the need for unconstrained attachment to the RFQ. In addition, the mobile installation cart and the fully automated vacuum control system will be discussed.

27145 (SSCL-Preprint–398) **The SSCL RFQ system integration.** Arbique, G.; Calo, A.; Cuevas, C.; Datte, P.; Evans, D.; Hurd, J.; Marsden, E.; Saadatmand, K.; Sage, J. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–184: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93016103. Source: OSTI; NTIS; INIS; GPO Dep.

The integration and performance of subsystems on the Superconducting Super Collider Laboratory (SSCL) 428 MHz, 0.1% duty factor radiofrequency quadrupole accelerator is reported. Results of low- and high-power rf measurements on the RFQ cavity are compared to design specifications. Operation of the integrated RFQ vacuum, temperature and supervisory control systems are described.

27146 (SSCL-Preprint–400) **Computer simulation and cold model testing of CCL cavities.** Chang, C.R.; Yao, C.G.; Swenson, D.A.; Funk, L.W. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–183: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93016105. Source: OSTI; NTIS; INIS; GPO Dep.

The SSC coupled-cavity-linac (CCL) consists of nine modules with eight tanks in each module. Multicavity magnetically coupled bridge couplers are used to couple the eight tanks within a module into one RF resonant chain. The operating frequency is 1282.851 MHz. In this paper we discuss both computer calculations and cold model measurements to determine the geometry dimension of the RF structure.

27147 (SSCL-Preprint–414) **Issues of the transverse feedback systems design at the SSC.** Chou, W.; Peterson, J. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–180: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015902. Source: OSTI; NTIS; INIS; GPO Dep.

The transverse feedback systems are needed at the SSC for several different reasons. The requirements of these systems are analyzed and specified. In addition to the general requirements (power, bandwidth and gain), specific attention is given to the noises in the systems, which need to be controlled in order to keep the emittance growth at a tolerable rate. A quantitative treatment is given to specify the allowable noise level in the feedback systems.

27148 (UCRL-JC–109740) **SNOELF: An FEL-based drive beam injector for CLIC.** Barletta, W.A. (Lawrence Livermore National Lab., CA (United States)); Bonifacio, R. Lawrence Livermore National Lab., CA (United States). Jul 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920706–53: International conference on high energy accelerators, Hamburg (Germany), 20-24 Jul 1992). Order Number DE93012574. Source: OSTI; NTIS; GPO Dep.

We describe a means of producing at train of 40kA pulses of 3 ps duration as the drive beam for CLIC using an amalgam of magnetic switching technology plus a rf-linac driven free electron laser (FEL) buncher. Potential debunching effects are discussed. Finally we describe a low energy test experiment.

27149 (UCRL-JC–110198) **Status of the Choppertron experiments.** Houck, T.L.; Westenskow, G.A. Lawrence Livermore National Lab., CA (United States). Aug 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9208109–83: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93013428. Source: OSTI; NTIS; INIS; GPO Dep.

The Choppertron is a high-power, 11.4-GHz microwave generator driven by a linear induction accelerator (LIA). Earlier work with the Chopperton using a 2.5-MV, 1-kA beam demonstrated both high power and quality (phase and amplitude stability) microwave pulses. Significant effort was expended on suppressing pulse shortening caused by excitation of higher order modes. A new series of experiments are coming on-line using a 5-MV, 1-kA LIA beam to drive an upgraded Choppertron. In this paper we review the performance of the Choppertron at 2.5 MV including observed pulse shortening and describe the current status of the experiments. We discuss proposed experiments including reacceleration, active phase stabilization, and high-power microwave extraction.

27150 (UCRL-JC–110200) **Computation of wakefields in structures containing dispersive materials.** DeFord, J.F. (Lawrence Livermore National Lab., CA (United States)); Craig, G.D.; Kamin, G.; Walling, L. Lawrence Livermore National Lab., CA (United States). 21 Aug 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9208109–85: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93013418. Source: OSTI; NTIS; INIS; GPO Dep.

Ferrite has a variety of applications in accelerator components, and the capability to model this magnetic material in the time domain is an important adjunct to currently available accelerator modeling tools. In this paper is described a general dispersive material model which is suitable for a wide variety of media, including ferrite. Based on this model we have developed a representation of the time-domain magnetic properties of PE11BL, the ferrite used in the induction modules of the ETA-II (Experimental Test Accelerator - II) induction linac at LLNL. This material is characteristic of the soft ferrites commonly used in induction accelerators. The model has been implemented in I-D and 2-D finite-difference time-domain (FDTD) electromagnetic simulators, and comparisons with analytic and experimental results are presented.

27151 (UCRL-JC–112343) **One dimensional simulations of transients in heavy ion injectors.** Barnard, J.J. (Lawrence Livermore National Lab., CA (US)); Caporaso, G.J.; Yu, S.S.; Eylon, E. Lawrence Livermore National Lab., CA (United States); Lawrence Berkeley Lab., CA (United States). 11 May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;AC03-76SF00098. (CONF-930511–214: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93016547. Source: OSTI; NTIS; INIS; GPO Dep.

A fast-running time-dependent one-dimensional particle code has been developed to simulate transients in both electrostatic quadrupole and electrostatic column heavy-ion injectors. Two-dimensional effects are incorporated through the use of an approximation to the transverse part of the Laplacian operator. Longitudinal electric fields are solved on a mesh. An external circuit is coupled to the column, and the effect of the beam on the circuit is modeled. Transients such as initial current spikes, space-charge de-bunching, and beam loading of the circuit, are simulated. Future directions for the code include introduction of envelope and centroid equations to provide beam radius and displacement information and the modeling of secondary electron currents arising from beam-spill.

27152 (UCRL-JC–114215) **Reacceleration experiment to demonstrate the concept of efficiency enhancement in a relativistic klystron two-beam accelerator.** Westenskow, G.A.; Houck, T.L. Lawrence Livermore National Lab., CA (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930511–8: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93013856. Source: OSTI; NTIS; INIS; GPO Dep.

High conversion efficiency of electro beam energy to rf energy can be achieved in two-beam accelerators using reacceleration of the bunched drive beam. To study issues with these designs we are planning a demonstration in which a modulated beam's energy is boosted as it passes through induction accelerator cells. For this experiment we will use the front end of the Choppertron to modulate a 5 MeV electron beam at 11.4 GHz. We have now tested the 5-MeV Choppertron and are reporting on the results. For the reacceleration experiment we plan to use three stages of rf power extraction interspersed with two stages of reacceleration.

27153 (BNL–48217) **Development of distributed ion pumps for g-2 beam vacuum system.** Hseuh, H.C.; Mapes, M.; Snydstrup, L. Brookhaven National Lab., Upton, NY (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–151: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015404. Source: OSTI; NTIS; INIS; GPO Dep.

Distributed ion pumps (DIPs) will be used for the beam vacuum system of the g-2 muon storage ring. The magnetic field intensity and alignment angle at the DIP locations are not uniform. The pumping behavior of several different ion pump elements under this non-uniform magnetic field has been studied. The results are compared with the theoretical predictions. Based on these results, the optimum design of the g-2 DIPs has been developed.

27154 (BNL–48271) **A simulation study of linear coupling effects and their correction in RHIC.** Parzen, G. Brookhaven National Lab., Upton, NY (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–150: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015403. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes a possible skew quadrupole correction system for linear coupling effects for the RHIC92 lattice. A simulation study has been done for this correction system. Results are given for the performance of the correction system and the required strength of the skew quadrupole corrections. The location of the correctors is discussed. For RHIC92, it appears possible to use the same 2 family correction system for all the likely choices of β^*. The simulation study gives results for the residual tune splitting that remains after correction with a 2 family correction system. It also gives results for the beta functions before and after correction.

27155 (BNL–48367) **Desorption measurements of copper and copper alloys for PEP-II.** Foerster, C.L. (Brookhaven National Lab., Upton, NY (United States)); Halama, H.; Korn, G.; Calderon, M.; Barletta, W. Brookhaven National Lab., Upton, NY (United States). [1992]. 16p. (CONF-9210161–5: 12. international vacuum congress; 8. international conference on solid surfaces, Hague (Netherlands); Hague (Netherlands), 12-16 Oct 1992; 12-16 oct 1992; CONF-9210162–4). Order Number DE93015398. Source: OSTI; NTIS; INIS; GPO Dep.

PEP-II will be a meson factory circulating asymmetric beams of 9 GeV and 3.1 GeV having maximum currents of 3.0A. Copper beam chambers and absorbers will intercept resulting synchrotron radiation and it is critical that the dynamic gas load from photo stimulated desorption (PSD) and thermal outgassing is below 2×10^{-1} molecules per photon. An experiment was set up to measure PSD from 1m long bar samples and a chamber sample, fabricated from selected copper and copper alloys then exposed to white light with a critical energy of 500 eV, on beamline U10B at the VUV ring of the National Synchrotron Light Source (NSLS). Based on U10B results a prototype chamber was built and will be exposed to white light with higher critical energies of up to 5 KeV, on beamline X-28A at the X-ray Ring of the NSLS. This paper presents the measurements of H_2, CO, CO_2 and CH_4 desorption yields as function of accumulated photon flux, angle of incidence, sample material, and surface condition. The results are compared with that of previous work on similar materials and with that of others for copper.

27156 (IFVE-OP–91-123) **Errors in beam channels and their correction.** Garkusha, V.I.; Kartashev, V.P.; Kotov, V.I.; Novgorodov, A.L.; Novoskol'tsev, F.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1991. [13p.] (In Russian). Order Number DE93629654. Source: OSTI; NTIS (US Sales Only); INIS.

Error alignment-effecting of the beam magnet elements (with taking into account the geodesic procedures of installation) and their regimes to beam characteristics are considered. The obtained expressions allow to estimate the changing ranges of beam parameters and choose the optimum correction systems of optic axis and beam envelope during the beams design stage. The results are illustrated on example of transport of UNK proton beam extracted from accelerator. 4 refs.; 5 figs.

27157 (IFVE-OUNK–91-178) **Methods of UNK SC-dipoles magnetic measurements.** Smirnov, N.L. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1991. [16p.] (In Russian). (CONF-9106433–: 7. International Magnetic Measurement Workshop (IMMW-7), Darmstadt (Germany), 18-21 Jun 1991). Order Number DE93628272. Source: OSTI; NTIS (US Sales Only); INIS.

Presented at the 7th International meeting on magnetic dimensions, Darmstadt (Germany), 18-21 June 1991.

Many SC-dipoles for UNK will require from the chosen magnetic measurement methods high accuracy and efficiency. The brief of using methods, their possibilities and analysis of their errors are given. The measurements results for a full-scale model of SC-dipole SPDM1 are presented. 5 refs.; 4 figs.; 3 tabs.

27158 (IYaF–91-120) **Suppression of emittance growth caused by mechanical vibrations of magnetic elements in presence of beam-beam effects in the SSC.** Lebedev, V.A.; Parkhomchuk, V.V.; Shil'tsev, V.D.; Skrinskij, A.N. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. [51p.] Order Number DE93629655. Source: OSTI; NTIS (US Sales Only); INIS.

A ground motion produces shifts of storage ring quadrupoles. It strongly influences on the beam behaviour in large proton (anti)proton colliders due to the closed orbit distortion and due to the transverse emittance growth. Calculations of both effects are presented in this paper. An active feedback system is useful for the emittance growth suppression. It is shown that in this case the main parameter which determines the emittance growth is the betatron tune spread due to the beam-beam effects. A simple analytical model is considered which results are in good coincidence with computer simulations. All calculations are adapted to the Superconducting Super Collider (SSC). 13 refs.; 9 figs.; 3 tabs.

27159 (JAERI-M–93-021) **Calculations of thermal deformations in directly water-cooled monochromator crystals.** Matsuki, Nobuo (JAERI-RIKEN SPring-8 Project Team, Tokyo (Japan)); Hashimoto, Shinya; Motohashi, Haruhiko. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1993. 26p. (In Japanese). Order Number DE93508284. Source: OSTI; NTIS; INIS.

Computer simulations on the thermal behaviors, i.e., thermal transfer coefficient, temperature distribution and thermal deformations of monochromator crystals have been reported under the condition that they would be used in SPring-8. The calculations have been carried out on the basis of high heat load experiments by the present authors with a finite element analysis code (ANSYS). The bending-magnet (with power density of 0.27 MW/m^2 on crystal surface) causes a temperature rise of 4 K and a slope error

of 0.27 arcsec on the top surface of crystal. On the prototype X-ray undulator WPH-33J beamline, the crystal receives a power density of 8.1 MW/m^2, having a temperature rise of 85 K and a slope error of 2.1 arcsec in the simulation. (author).

27160 (JAERI-M–93-030) **Simulation of electron-positron convertor for SPring-8.** Mizuno, Akihiko (JAERI-RIKEN SPring-8 Project Team, Tokyo (Japan)); Suzuki, Shinsuke; Yoshikawa, Hiroshi; Hori, Toshihiko; Yanagida, Kenichi; Yokomizo, Hideaki. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 46p. (In Japanese). Order Number DE93508313. Source: OSTI; NTIS; INIS.

In the SPring-8, we are planning to use positrons in order to increase the beam life time in a storage-ring. These positrons are producted at a electron-positron convertor in a linac. In this report, we presented simulations about conversion efficiency of the convertor with various magnetic fields of the convertor system. We constructed the test apparatus of convertor in Tokai establishment, JAERI. But in this report, we also simulated with the conditions which are not available in the apparatus, so as to cover the results of experiments. And we found the best constitution of magnetic fields for the convertor. The conversion efficiency is up to 0.27% with the best magnetic fields. The aim of this report is to help designing the positron-electron convertor of the SPring-8 linac. (author).

27161 (JAERI-M–93-051) **Basic study on vacuum system of an electron synchrotron and mock-up tests.** Ohtsuka, Hideo (JAERI-RIKEN SPring-8 Project Team, Tokyo (Japan)); Yoneyama, Shoji; Shimada, Taihei. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 43p. (In Japanese). Order Number DE93508316. Source: OSTI; NTIS; INIS.

Simple methods which are intended for the vacuum system of an electron synchrotron are applied to the fundamental design study. Those subjects are beam life time as a function of the vacuum pressure, the pressure distribution in the duct, heat problem due to synchrotron radiation, stray magnetic fields due to eddy currents and others. Mock-up tests of the vacuum system have been also made. Data base which can be utilized at the design work has been obtained. Furthermore, good agreements between the simple analyses and the experimental results are shown. (author).

27162 (KEK–92-20) **Report of the design study on a high brilliance configuration of the PF storage ring.** Katoh, M.; Hori, Y. (eds.). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Feb 1993. 191p. (In Japanese). Order Number DE93508335. Source: OSTI; NTIS; INIS.

The 2.5 GeV Photon Factory storage ring has been steadily improved by decade-long research and development. Its performance, especially the stored current, beam lifetime and beam stability, has been achieved to the world highest level. As one of our recent activities, a high brilliance configuration was proposed. In the new configuration, the focussing magnet of the normal cells will be reinforced. Every light source position and direction of beamline will not be changed since all bending magnets keep their present locations. The beam emittance will be reduced to 27 nmrad which is one fifth of the present value (130 nmrad). The brilliance will be increased typically by a factor of 10. In this report, we describe the high brilliance ring configuration as well as the procedure and time schedule in the possible reconstruction. (author).

27163 (LA-UR–93-1868) **First-turn losses in the LAMPF Proton Storage Ring (PSR).** Hutson, R.; Macek, R. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–111: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014477. Source: OSTI; NTIS; INIS; GPO Dep.

Beam-loss measurements protons injected into the PSR are lost during the first turn. We describe a plausible mechanism, involving field stripping of excited hydrogen atoms, for these losses. Protons are injected into the PSR by transporting a neutral hydrogen beam through a hole in the yoke of one ring bender and then through a carbon foil on the ring axis. The foil strips roughly 93% of the beam atoms to protons. Although the original PSR design assumed that all unstripped atoms would pass through a hole in the yoke of the next downstream bender and on to a beam stop, recent calculations indicate that about 6% of these unstripped atoms will emerge from the foil in an excited state with principle quantum number $n \geq 23$. These calculations also indicate that atoms in excited states with $n \geq 3$ will be stripped quickly to protons in the 1.2-Tesla field of the downstream bender. The trajectories of these protons will be outside the phase-space acceptance of the ring and will be quickly lost by collision with the beam pipe, thereby giving rise to first-turn losses. The estimated numbers of protons that would be lost by this mechanism are consistent with the observed first-turn loss rates. This mechanism has important consequences for the design of future storage rings that use neutral atom or negative ion stripping for injection.

27164 (LA-UR–93-1874) **Recent study of beam stability in the PSR.** Wang, T.S.F. (Los Alamos National Lab., NM (United States)); Cooper, R.; Fitzgerald, D.; Frankle, S.; Hardek, T.; Hutson, R.; Macek, R.; Ohmori, C.; Plum, M.; Thiessen, H.; Wilkinson, C.; Colton, E.; Neuffer, D.; Rees, G. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–112: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014473. Source: OSTI; NTIS; INIS; GPO Dep.

A fast transverse instability with beam loss has been observed in the 800 MeV Los Alamos Pro Ring (PSR) when the injected beam intensity reaches 2 - 4 $\times$ 10^{13} protons per pulse. Previous observations in that the instability is most likely driven by electrons trapped within the proton beam. Theoretical study shown that beam leakage into the inter-bunch gap leads to electron trapping. Recent experiments were carried out by using the newly implemented "pinger" and by varying the machine transition gamma to explore further the "e-p" instability and the nature of the instability. This paper summarizes some of these recent experimental results and theoretical studies.

27165 (LA-UR–93-1921) **Beam pinging, sweeping, shaking, and electron/ion collecting, at the Proton Storage Ring.** Hardek, T.W.; Macek, R.J.; Plum, M.A.; Wang, T.S.F. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–114: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014457. Source: OSTI; NTIS; INIS; GPO Dep.

We have built, installed and tested a pinger for use as a general diagnostic at the Los Alamos Proton Storage Ring (PSR). Two 4-m-long parallel-plate electrodes with a plate spacing of 10.2 cm provide kicks of up to 1.1 mrad. A pair of solid-state pulsers may be operated in a single-pulse mode for beam pinging (tune measurements) or in a burst mode at up to 700 kHz pulse rates for beam sweeping. During our 1992 operating period we used the pinger for beam sweeping, for beam shaking, for measuring the tune shift, and we have used it as an ion chamber. Using the pinger as an ion chamber during production conditions has yielded some surprising results.

27166 (LBL–33307) **Design of the Advanced Light Source timing system.** Fahmie, M. Lawrence Berkeley Lab., CA (United States). May 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930511–157: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015042. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Light Source (ALS) is a third generation synchrotron radiation facility, and as such, has several unique timing requirements. Arbitrary Storage Ring filling patterns and high single bunch purity requirements demand a highly stable, low jitter timing system with the flexibility to reconfigure on a pulse-to-pulse basis. This modular system utilizes a highly linear Gauss Clock with "on the fly" programmable setpoints to track a free-running Booster ramping magnet and provides digitally programmable sequencing and delay for Electron Gun, Linac, Booster Ring, and Storage Ring RF, Pulsed Magnet, and Instrumentation systems. It has proven itself over the last year of accelerator operation to be reliable and rock solid.

27167 (SLAC-PUB–6035) **Bunch-by-bunch feedback for PEP II.** Oxoby, G. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Claus, R.; Eisen, N.; Fox, J.; Hindi, H.; Hoeflich, J.; Olsen, J.; Sapozhnikov, L.; Linscott, I. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9211172–6: International workshop on B factories: accelerators and experiments, Tsukuba (Japan), 17-20 Nov 1992). Order Number DE93015598. Source: OSTI; NTIS; INIS; GPO Dep.

The proposed PEP II B factory at SLAC requires a feedback to damp out longitudinal synchrotron oscillations. A time domain, downsampled, bunch-by-bunch feedback system in which each bunch is treated as an oscillator being driven by disturbances from other bunches is presented as we review the evolution of the system design. Results from a synchrotron oscillation damping experiment conducted at the SLAC/SSRL/SPEAR ring are also presented in this paper.

27168 (UCRL-JC–112334) **Distributed ion pump testing for PEP II, asymmetric B-Factory collider.** Calderon, M. (Lawrence Livermore National Lab., CA (United States)); Holdener, F.; Barletta, W.; Petersen, D.; Foerster, C. Lawrence Livermore National Lab., CA (United States). 12 May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930511–133: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93015102. Source: OSTI; NTIS; INIS; GPO Dep.

At its design level, PEP-II will circulate asymmetric beams at 9 GeV and 1.5 A in a High Energy Ring and 3.1 GeV with 2.1 A in a Low Energy Ring. In addition, the vacuum systems of both rings will be designed to operate at a maximum current of 3 A to provide for higher current operation in the future. Pumping for both rings is provided by sputter ion pump systems. In the High Energy Ring, high gas loads, deriving from the intense photon radiation, are calculated at 1.06 x 10^{-6} Torr liters s^{-1} m^{-1} using a desorption coefficient (eta) of 2 x 10^{-6} molecules $photon^{-1}$. To maintain an average pressure of 5 nTorr or less in the arc cells, lumped ion pumps are used in the 2 m long straight sections and distributed ion pumps are used in the 6 m long dipole chambers where the conductance of the vacuum chamber is prohibitively low. To achieve these pressures, the distributed ion pump system is required to have pumping speeds of 110 liters s^{-1} m^{-1} however, a design level of 165 liters s^{-1} m^{-1} has been set to provide a factor of safety of 50% based on pumping alone.

27169 (ANL-HEP-TR–93-36) **Measurement of source tube radial position in cast EMC testbeam module.** Jankowski, D.; Stanek, R. Argonne National Lab., IL (United States). High Energy Physics Div. 5 May 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (SDC–93-499). Order Number DE93015145. Source: OSTI; NTIS; INIS; GPO Dep.

Using a ^{137}Cs source we have determined the position of two of the source tubes embedded in the Pb absorber in the cast EMC module used in the Fermilab test beam. Two scintillator tiles placed in the gaps on both sides of an absorber containing a source tube were readout into independent phototubes. The difference in scintillator response was measured in two towers at two different source tube layers. We find the source tube to be displaced towards the (radial) front of the EMC by about 1.6 mm in both measurements. Work is proceeding now to check other source tubes in other locations.

27170 (BNL–48807) **Evaluation of an x-ray fluorimeter for measuring lead in paint.** Klein, R.C.; Horn, F.T.; Wilson, R.D. Brookhaven National Lab., Upton, NY (United States). 17 Mar 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93014316. Source: OSTI; NTIS; GPO Dep.

A laboratory analysis of key performance features of the Warrington Microlead I XRF Analyzer was conducted. This analysis included the determination of instrument accuracy and precision as measured against standard reference materials as well as the instrument's ability to provide information for multiple layers of a lead-based paint.

27171 (BNL–48960) **Crystallographic and metallurgical characterization of radiation detector grade cadmium telluride materials.** Johnson, C.J. (II-VI, Inc., Saxonburg, PA (United States). eV Products Div.); Eissler, E.E.; Cameron, S.E.; Kong, Y.; Fan, S.; Jovanovic, S.; Lynn, K.G. Brookhaven National Lab., Upton, NY (United States). [1993]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930405–11: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93014335. Source: OSTI; NTIS; GPO Dep.

Radiation detector grade CdTe crystals are characterized by several crystallographic and metallurgical techniques including infrared microscopy, dislocation etch pitting and X-ray diffraction. Results are presented for a set of 50 detectors fabricated from an ingot produced by the High Pressure Bridgman method. Data on the temperature dependence of leakage current and pulse height analysis are presented, along with measurements of room temperature charge transport properties. Attempts to relate crystal structure to detector performance discussed.

27172 (CEA-LNS-GT–92-06) **Analysis of ^3He from $p+d \rightarrow {}^3He+\eta$ by a combination of solenoid and spectrometer.** Doornbos, J. Laboratoire National Saturne - Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). 1992. [24p.] Order Number DE93631539. Source: OSTI; NTIS (US Sales Only); INIS.

The ETA Collaboration aims to measure the decay $\eta \rightarrow \mu^+, \mu^-, \pi^0$. The η particles are produced in the reaction $P+D \rightarrow {}^3He+\eta$ at a proton energy of 896 MeV just above the η production threshold. The ^3He momentum is 1,320 MeV/c, which is 660 MeV/c per unit of charge. The two muons are analyzed in a muon spectrometer. These decay products are tagged with the ^3He which are analyzed in a separate spectrometer, the SATURNE spectrometer SPES2. The results of an investigation of the optics of the ^3He are given, in this combined system of solenoid and spectrometer. (R.P.) 2 refs.; 16 figs.

27173 (CEA-R–5624) **Adjustment of a goniometer for X-rays optics calibration in the spectral range 1.5-20 KeV.** Legistre, S. Conservatoire National des Arts et Metiers (CNAM), 75 - Paris (France); CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France). Oct 1992. [98p.] (In French). Order Number DE93631550. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of this memoir is the adjustment of a (θ, 2θ) goniometer coupled to X-rays source to calibrate mirrors (single layers like C, Ni, Au, etc... and multilayers like C/W, Si/W, etc...) in the spectral range 1.5 - 20 keV. For each kind of tested optics the adjustment of the goniometer include the procedure alignment of the different components (X-ray source, collimation slits, optics, detectors) and the first reflectivity measurements. Those measurements are compared those realized at LURE, using synchrotron radiation provided by SUPER ACO storage ring, and to a theoretical simulation.

27174 (CONF-9209263–13) **Signal processing for liquid ionization calorimeters.** Cleland, W.E.; Stern, E.G. Pittsburgh Univ., PA (United States). Dept. of Physics and Astronomy. [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40646 ;AC02-80ER10667. From 3. international conference on calorimetry in high energy physics; Corpus Christi, TX (United States); 29 Sep - 2 oct 1992. Order Number DE93013490. Source: OSTI; NTIS; INIS; GPO Dep.

We present the results of a study of the effects of thermal and pileup noise in liquid ionization calorimeters operating in a high luminosity calorimeters operating in a high luminosity environment.

The method of optimal filtering of multiply-sampled signals which may be used to improve the timing and amplitude resolution of calorimeter signals is described, and its implications for signal shaping functions are examined. The dependence of the time and amplitude resolution on the relative strength of the pileup and thermal noise, which varies with such parameters as luminosity, rapidity and calorimeter cell size, is examined.

27175 (CRN-CPR–90-06) **Temporal and spectral analysis of the synchronization of synchroscan streak cameras.** Cunin, B. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires); Geist, P.; Heisel, F.; Martz, A.; Miehe, J.A. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. 1990. [9p.] (CONF-9009248–: 19. international congress on high speed photography and photonics, Cambridge (United Kingdom), 16-22 Sep 1990). Order Number DE93631540. Source: OSTI; NTIS (US Sales Only); INIS.

A stochastic model has been developed to explain the well-known experimental results in synchroscan measurements with actively mode-locked lasers. It is demonstrated that, in the configuration where the synchronization is carried out by means of the ultrastable oscillator exciting the acousto-optic mode-locker of the laser, the overall temporal resolution is considerably lower than in the case where the deflection is performed by the electric signal directly derived from the optical recurrent pulses. The calculations including both random period fluctuations of the laser pulses and temporal jitter due to the electronic trigger system are corroborated by experimental investigations. The study shows that even in the presence of the phase noise in the laser beam, a jitter free synchronization can be achieved. (author) 8 refs.; 4 figs.

27176 (CRN-CPR–91-01) **Towards jitter free synchronization of synchroscan streak cameras by noisy periodic laser pulses.** Cunin, B. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires); Heisel, F.; Miehe, J.A. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. 1991. [18p.] Order Number DE93631541. Source: OSTI; NTIS (US Sales Only); INIS.

To be published in Optics Communications, 1991 v. 82(491).

In connection with the parameters characterizing the phase noise in cw mode-locked lasers and under the employ of streak cameras operated by sinewave deflection, the timing capabilities of the measuring system for two commonly used synchronization techniques are discussed by stochastic description. Especially, the power spectrum of the sweep signal versus the laser phase noise is examined in detail. The theoretical results are used to interpret experimental observations recorded by means of actively and passively mode-locked lasers. One of the interesting applications of synchroscan operations to metrology is the determination of short-term instabilities of the oscillator on a time scale near to the period. (author) 12 refs.; 3 figs.

27177 (CRN-CPR–91-02) **Stochastic analysis of synchroscan operations of a streak camera.** Cunin, B. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires); Heisel, F.; Miehe, J.A. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. 1991. [16p.] Order Number DE93631551. Source: OSTI; NTIS (US Sales Only); INIS.

To be published in Applied Physics B, 1991 v. 53(148).

A theoretical and experimental study of the picosecond synchronization of a streak camera used in conjunction with a cw actively mode-locked laser system is presented. The temporal resolutions of two synchronization set-ups, a passive device (the sweep is obtained directly from the modelocker oscillator) and an active arrangement (the deflection is derived from the recurrent laser pulses through a photodiode and a tunnel diode) have been examined. On the basis of the stochastic analysis it has been possible to interpret the experimental results for both configurations: particularly it has been demonstrated that even in the presence of phase noise in the laser signal, perfect synchronization can be achieved. (author) 13 refs.; 4 figs.

27178 (DOE/ER/40149–T1) **Studies of nuclei far from stability in the A=80 mass region: Final report.** Coldwell, R.L.; Dunnam, F.E.; Muga, M.L.; Rester, A.C. Florida Univ., Alachua, FL (United States). Inst. for Astrophysics and Planetary Exploration. [1990]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-84ER40149. Order Number DE93015732. Source: OSTI; NTIS; INIS; GPO Dep.

A three-stage thin-film detector for the identification of heavy ion fragments was investigated in beam at HHIRF. An experiment on Eu-152 for the purposes of calibrating a four-crystal Germanium polarimeter was performed. The instrument was then used in an experiment to establish polarities for the low-lying transitions in ^{82}Sr. The spectral fitting code ROBFIT was applied to the data analysis and shown to perform well on the extraction of weak peaks in high background situations.

27179 (DOE/FTR–93013020) **[Travel to China to evaluate facilities for the production of barium fluoride and other inorganic scintillating crystals used in high energy physics detectors]: Foreign trip report, July 1–16, 1992.** Wuest, C.R. Lawrence Livermore National Lab., CA (United States). 6 Aug 1992. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013020. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This trip involved meeting with groups of physicists and engineers on a daily basis for 12 days to see facilities in China that could be useful for the full-scale production of barium fluoride scintillating crystals for the GEM Detector to be built at the SSC. Meetings and tours were arranged by our Chinese hosts. Among the facilities visited were the optical coating facility at BGRI, the heavy machine shops and fine optics machining, polishing and coating facilities at ZOIF, and the crystal growing and machining shops at SICCAS, Jiading Plant. Briefings were given to the Chinese regarding the state of R&D at the SSC and within the Barium Fluoride Collaboration. Technical discussions included detailed descriptions of recent progress in China on the growing, machining, polishing and optical coating of barium fluoride crystals, as well as similar work being carried out at LLNL as well as other Institutes in the US and Europe.

27180 (EGG–10617-2168) **Optical properties and surface morphology studies of palladium contacts on mercuric iodide single crystals.** George, M.A. (Fisk Univ., Nashville, TN (United States). Dept. of Physics); Azoulay, M.; Burger, A.; Biao, Y.; Silberman, E.; Nason, D. EG and G Energy Measurements, Inc., Goleta, CA (United States). Santa Barbara Operations. [1993]. 16p. Sponsored by National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC08-88NV10617. Grant NAGW–2925. (CONF-930419–2: International conference on metallurgical coatings and thin films, San Diego, CA (United States), 19-23 Apr 1993). Order Number DE93012510. Source: OSTI; NTIS; GPO Dep.

Palladium is chemically suitable for electric contacts on mercuric iodide detectors for photon and nuclear radiation detection, so the understanding of palladium contacts is important for fundamental and practical scientific purposes. A study has been conducted on the surface morphology of evaporated contacts using Atomic Force Microscopy (AFM) and optical transmission and reflection. Evaporated palladium coatings are typically nonuniform and may deposit selectively on mercuric iodide surface defects. Reflection measurements show that coating thickness and surface treatment affect intensity, position and shape of a reflected peak characteristic of the mercuric iodide structure. Results indicate that the band gap energy in the surface of the mercuric iodide is lowered by palladium contacts.

27181 (EGG–10617-2182) **Electronic characterization of mercuric iodide gamma ray spectrometers.** Gerrish, V.M. EG and G Energy Measurements, Inc., Goleta, CA (United States). Santa Barbara Operations. [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. (CONF-930405–22: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93015524. Source: OSTI; NTIS; INIS; GPO Dep.

During the past four years the yield of high resolution mercuric iodide (HgI_2) gamma ray spectrometers produced at EG&G/EM has increased dramatically. Data is presented which demonstrates a strong correlation between starting material and spectrometer performance. Improved spectrometer yields are attributed to the method of HgI_2 synthesis and to material purification procedures. Data is presented which shows that spectrometer performance is

correlated with hole mobility-lifetime products. In addition, the measurement of Schottky barrier heights on HgI_2 spectrometers has been performed using I-V curves and the photoelectric method. Barrier heights near 1.1 eV have been obtained using various contacts and contact deposition methods. These data suggest the pinning of the Fermi level at midgap at the HgI_2 surface, probably due to surface states formed prior to contact deposition.

27182 (ENEA-RT-INN–90-29) **Measure of radiation damage induced by gamma-rays source on organic scintillators and its recovery time.** Baccaro, S.; D'Atanasio, P.; Marini, G.; Gennis, M.; Mattioli, M.; Nigro, A.; Talice, S. ENEA, Casaccia (Italy). Area Energia e Innovazione; Rome Univ. (Italy). Dipt. di Fisica; Hamburg Univ. (Germany). 2. Inst. fuer Experimentalphysik. Dec 1990. 18p. (RT/INN–90-29). Order Number DE93799297. Source: OSTI; NTIS (US Sales Only); INIS.

The radiation damage to organic scintillating materials and wavelength shifters was investigated at total doses 10^3 -:- 4 x 10^4 Gy in air and in nitrogen environments. In the present experiment, the samples were exposed to the gamma-radiation from a ^{60} Co source (dose rate = 66.18 Gy/h). The radiation damage was measured by investigating the charge in light trasmittance and in the light output of the scintillators and wavelenght shifter. The results show that significant losses are caused to the plastic scintillator and WLS above 1kGy and that, generally, there appears to be a different behaviour between polyvinyltoluene base scintillators and other materials with respect to the environment.

27183 (ETDE-IT–93-164) **Whole body counters operating in Italy: MIDIA 1991 report.** Melandri, C.; Castellani, C.M.; Formignani, M.; Guidarelli, G. ENEA, Bologna (Italy). Jan 1992. 31p. (In Italian). Order Number DE93799240. Source: OSTI; NTIS (US Sales Only); INIS.

In 1991, MIDIA, an Italian radiation protection organization overseeing whole body counting activities in Italy, conducted a complete survey of whole body counters operating in Italy. This paper presents the tabled data classifying the counters according to various descriptive parameters: location, flexibility of use, shielding, measurement geometry, detector type number and size, type of calibration phantoms and radionuclides, background radiation values, measurement methods, equipment performance and maintenance characteristics.

27184 (ETDE-IT–93-164-Suppl.) **Whole body counters operating in Italy: MIDIA 1991 report. Supplement 'Whole body counters technical schedules'.** Melandri, C.; Castellani, C.M.; Formignani, M.; Guidarelli, G. ENEA, Bologna (Italy). 1992. 111p. (In Italian). Order Number DE93799241. Source: OSTI; NTIS (US Sales Only); INIS.

27185 (FNAL/C–93/046-E) **The Dν upgrade silicon tracker.** Heinson, A.P. For the D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-921122–63: Meeting of the Division of Particles and Fields of the American Physical Society, Batavia, IL (United States), 10-14 Nov 1992). Order Number DE93014717. Source: OSTI; NTIS; INIS; GPO Dep.

A large silicon strip tracking detector is planned for the upgrade of the D0 experiment at Fermilab. This detector is designed to gag secondary vertices, to measure the momenta of charged particles and to operate in the high rate environment of the upgraded Tevatron. Details of the detector design are presented here.

27186 (FNAL/C–93/049-E) **Low energy response of the D0 calorimeter and jet energy measurement.** Bhat, P.C. D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-921122–57: Meeting of the Division of Particles and Fields of the American Physical Society, Batavia, IL (United States), 10-14 Nov 1992). Order Number DE93013569. Source: OSTI; NTIS; INIS; GPO Dep.

Previous studies of the Dν calorimeter with electron and hadron beams above 10 GeV/c have shown excellent linearity of response and e/π ratio close to one. Here we report on our measurements of the response of the DO central calorimeter modules down to 2 GeV/c. The measured low energy response for electrons and pions are fragmentation from the PYTHIA Monte Carlo to obtain the corrections for jet energy.

27187 (FNAL/C–93/148) **A fast ring-imaging Cherenkov counter for a fixed-target heavy-quark experiment.** Kaplan, D.M. (Northern Illinois Univ., De Kalb, IL (United States)); Isenhower, L.D.; Atac, M.; Brown, C.N.; Darden, C.W. Fermi National Accelerator Lab., Batavia, IL (United States). Jun 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9306188–1: 1. workshop on rich detectors, Bari (Italy), 1-5 Jun 1993). Order Number DE93016471. Source: OSTI; NTIS; INIS; GPO Dep.

We present a design for a fast ring-imaging Cherenkov counter operating in the visible. The Cherenkov photons are imaged on an array of small Winston cones and read out with optical fibers and VLPCs. the design is optimized for π/K/p separation in the range $10 < p < 100$ GeV/c.

27188 (FNAL-TM–1824) **Dead material and energy measurements in hadronic calorimeters.** Green, D. Fermi National Accelerator Lab., Batavia, IL (United States). Jan 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93014927. Source: OSTI; NTIS; INIS; GPO Dep.

Often the question arises as to where is the optimal place to locate "dead" material in a calorimeter. This material may be needed for structural reasons, for example. There needs to be a quantified answer to the question of what damage this "dead" material does to the performance of a calorimeter. For the purposes of this note, a hadronic calorimeter (HAD) is characterized by the mean and standard deviation of the energy measurement made by that detector.

27189 (FNAL-TM–1837) **Sampling nonuniformity in the SDC calorimeter EM/HAD boundary.** Green, D. Fermi National Accelerator Lab., Batavia, IL (United States). Apr 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93014014. Source: OSTI; NTIS; INIS; GPO Dep.

The SDC steel hadronic (HAD) calorimeter absorber structure has been designed to be of low magnetic reluctance, high rigidity, and excellent hermiticity. Transverse scintillator tiles staggered longitudinally allow one to assemble the hadronic calorimeter compartment with no transverse dead areas between tiles. Clearly, the structure affords many advantages, among them hermeticity. The only problem is that, at the boundary of the structure, as at the E boundary, the steel sampling fraction for adjacent transverse towers is different. In principle then, the adjacent towers will have different energy calibrations, and different energy resolutions. The aim of this note is to examine the size of these effects and, ff necessary, explore ways to minimize their impact.

27190 (FNAL-TM–1838) **High counting rate resistive-plate chamber.** Peskov, V.; Anderson, D.F.; Kwan, S. Fermi National Accelerator Lab., Batavia, IL (United States). May 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93014928. Source: OSTI; NTIS; INIS; GPO Dep.

Parallel-plate avalanche chambers (PPAC) are widely used in physics experiments because they are fast (<1 ns) and have very simple construction: just two parallel metallic plates or mesh electrodes. Depending on the applied voltage they may work either in spark mode or avalanche mode. The advantage of the spark mode of operation is a large signal amplitude from the chamber, the disadvantage is that there is a large dead time (msec) for the entire chamber after an event. The main advantage of the avalanche mode is high rate capability 10^5 counts/mm^2. A resistive-plate

chamber (RPC) is similar to the PPAC in construction except that one or both of the electrodes are made from high resistivity ($\geq 10^{10}$ Ω-cm) materials. In practice RPCs are usually used in the spark mode. Resistive electrodes are charged by sparks, locally reducing the actual electric field in the gap. The size of the charged surface is about 10 mm^2, leaving the rest of the detector unaffected. Therefore, the rate capability of such detectors in the spark mode is considerably higher than conventional spark counters. Among the different glasses tested the best results were obtained with electron type conductive glasses, which obey Ohm's law. Most of the work with such glasses was done with high pressure parallel-plate chambers (10 atm) for time-of-flight measurements. Resistive glasses have been expensive and produced only in small quantities. Now resistive glasses are commercially available, although they are still expensive in small scale production. From the positive experience of different groups working with the resistive glasses, it was decided to review the old idea to use this glass for the RPC. This work has investigated the possibility of using the RPC at 1 atm and in the avalanche mode. This has several advantages: simplicity of construction, high rate capability, low voltage operation, and the ability to work with non-flammable gases.

27191 (GANIL-P–92-25) **Heavy scintillators in nuclear physics.** Matulewicz, T. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)). Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1992. [11p.] (CONF-9209253–: Crystal 2000 international workshop on heavy scintillators for scientific and industrial applications, Chamonix (France), 22-26 Sep 1992). Order Number DE93631552. Source: OSTI; NTIS (US Sales Only); INIS.

The major topics of basic nuclear research and the reasons for selecting specific scintillation materials are overviewed. Only few types of scintillators satisfy the demand and are commonly used in nuclear physics. The actual request of scintillation-based detectors are presented in the context of fundamental nuclear physics in the following areas: reaction mechanism, nuclear structure, physics of mesons and energetic photons in heavy-ion collisions. Few examples of advanced detectors already operational or expected to be so in a near future are discussed with the emphasis on the use of heavy scintillators (CsI, BGO, BaF_2, etc.). (R.P.) 23 refs.; 3 figs.

27192 (GANIL-P–92-26) **Quenching of scintillation in BaF_2 for light charged particles.** Matulewicz, T. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)). Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1992. [5p.] Order Number DE93631543. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nucl. Instrum. Methods Phys. Res., Sect.A (NL).

Detectors made of a barium fluoride (BaF_2) crystal have recently become popular in the spectroscopy of photons and light charged particles at intermediate energies. The quenching of the scintillation light of BaF_2 crystals is described in the framework of Birks law for light charged particles in the energy range of 20-100 A MeV. Based on the recently published data, the analysis yields a value of Birks constant equal to 1.8 ± 0.3 mg $MeV^{-1}cm^{-2}$ and a scintillation efficiency equal to 0.79 ± 0.05 $MeV_{ee}MeV^{-1}$. (R.P.) 10 refs.; 2 figs.

27193 (INIS-mf–12758, pp. 471-478) **Dose control in semi industrial irradiation plant at the Ezeiza Atomic Center.** Dorda, E.M. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Aplicaciones). Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

In 1975 a study was initiated at the Division of Dosimetry to develop a technique and a system of dosimetry to be applied to the radiosterilization processes in the semi industrial irradiation plant of Ezeiza Atomic Center. The result of this study was the potassium nitrate/nitrite dosimeter used as routine dosimeter for control processes in food conservation, with a dose range of 0.2 kGy-1 kGy and in radiosterilization processes of disposable medical products of 1 kGy-150kGy. The potassium nitrate crystals undergo a radiolytic reduction. A linear correlation between the dose applied to the solid and the production of potassium nitrite was observed. After the irradiation of solid, the produced nitrite solution is colorimetrically titrated by measuring the absorbency in a spectrophotometer at 504 nm. The color is due to the formation of a diazonium salt and its later copulation with N-1 naphtylethylendiamine hydrochloride in acid medium. In 1980 a postal survey was organized presenting this dosimeter to standardize the irradiation dose in industrial process for Latin America. This dosimeter was presented in 1984 at the International Symposium on High Doses of the IAEA that took place in Vienna. Since them, comparative studies were performed between this dosimeter and those internationally considered and accepted: cerium(IV)/cerium(III) sulphate, ionization chamber of parallel plates, alanine. The results of comparison with the alanine dosimeter, which was used by Dr. Regula of the GSF of Munich, were the following: February 1985: 0% deviation; February 1986: 0.43% deviation. (Author).

27194 (INIS-mf–13543, pp. 131-138) **Track detectors.** Burian, I. (Ustav Hygieny Prace v Uranovem Prumyslu, Kamenna (Czech Republic)). Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

The systems used in Czechoslovakia for measuring radon and its daughter products are specified and the applicable detectors and measuring facilities are described. Integral track detectors, electrets, thermoluminescence materials, cellulose nitrate and polycarbonate are described and their assets and drawbacks are outlined, as are the ways of application and evaluation. (M.D.).

27195 (IYaF–91-118) **The gamma ray energy tagging spectrometer of ROKK-2 facility at VEPP-3 storage ring.** Kezerashvili, G.Ya.; Milov, A.M.; Vojtsekhowski, B.B. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. [24p.] Order Number DE93629753. Source: OSTI; NTIS (US Sales Only); INIS.

The gamma ray energy tagging spectrometer is described. The storage ring bending magnet was used as an analyzer for the gamma ray tagging spectrometer in the photon energy range from 1.5% up to 14% of the initial beam energy with the drift chambers as a coordinate detector. Factors determine the registration efficiency and the energy resolution of the tagging spectrometer are discussed. The tagging spectrometer energy resolution is measured by using the width of high energy edge of the Compton spectrum. The registration efficiency value consists 95% and the photon energy resolution is 4 MeV. 12 refs.; 10 figs.

27196 (IYaF–91-121) **High efficiency neutron spectrometer with low background.** Arzhannikov, A.V.; Kezerashvili, G.Ya.; Milov, A.M. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. [15p.] Order Number DE93629754. Source: OSTI; NTIS (US Sales Only); INIS.

A neutron energy spectrometer with a geometry close to 4π solid angle operated in the (1-5) MeV energy range at a suitable for a cold fusion experiment configuration and a very good n/γ discrimination, has been constructed. Tests of registration efficiency, energy resolution and radiation type identification have been made with a help of low intensity neutron and gamma sources. The spectrometer has shown the efficiency of about 10% at the $2 \times 10^{-3} s^{-1}$ background level and permits one to measure a neutron energy spectrum at a very low intensity of the source. Physical principles, design of the neutron detector system and results of its testing are described. 6 refs.; 6 figs.; 1 tab.

27197 (KAERC–903/89) **Manufacture of personal thermal neutron dosimeter with cadmium covered with $CaSO_4$(Dy).** Hyon Goom Sun, A.D.; Lyoo Hwa Choon. Ministry of Atomic Energy, Pyongyang (Korea, Democratic People's Republic of). Research Center for Atomic Energy. Feb 1989. [7p.] (In Korean). Order Number DE93628341. Source: OSTI; NTIS (US Sales Only); INIS.

We have made personal thermal neutron dosimeter with cadmium covered with $CaSO_4$(Dy) teflon dish which can be simply available. In mixture field where the ratio of thermal neutron and gamma ray dose rate is 2:1, thermal neutron dose may be measured with error less than +-15% from 10 to 10^4cy. (Author).

27198 (LA-UR-93-1640) **A neutron counter for small samples.** Sprinkle, J.K. Jr.; Menlove, H.O.; Miller, M.C.; Russo, P.A.; Jorgensen, C. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930533-2: 15. annual symposium of the European Safeguards Research and Development Association: safeguards and nuclear materials management, Rome (Italy), 11-13 May 1993). Order Number DE93012709. Source: OSTI; NTIS; GPO Dep.

The Inventory Sample Counter Model IV is the most recent neutron coincidence counter specifically designed to measure small samples. We used a combination of measurement experience and Monte Carlo modeling to design a neutron counter that can provide measurement results with an accuracy of 0.5% or better. Some applications incorporate a high-resolution detector into the neutron counter. This allows the simultaneous measurement of the plutonium isotopics using the passive gamma-ray emission and the measurement of the ^{240}Pu effective mass using the passive neutron emission. The two results are then combined to yield the plutonium mass.

27199 (LA-UR-93-1715) **A flat-cathode thermionic injector for the PHERMEX Radiographic Facility.** Kauppila, T. (Los Alamos National Lab., NM (United States)); Builta, L.; Burns, M.; Gregory, W.; Honaberger, D.; Watson, S.; Hughes, T. Los Alamos National Lab., NM (United States); Mission Research Corp., Albuquerque, NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511-104: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014584. Source: OSTI; NTIS; INIS; GPO Dep.

The PHERMEX (Pulsed High-Energy Radiographic Machine Emitting X-rays) standing-wave linear accelerator is a high-current electron beam generator used for flash-radiography. An improved electron gun has been designed employing a flat-thermionic cathode to replace the existing Pierce-geometry gun. The flat cathode yields increased current with the same applied voltage and cathode area as the Pierce gun. The ISIS code simulations indicate a beam current of 1.5 kA at 600 kV. The new geometry also reduces the probability for high voltage breakdown in the A-K gap. A reentrant magnet captures the expanding electron beam and a bucking coil nulls cathode-tinge field. A third coil is used to optimize the extraction field profile and reduce the effect of nonlinear space charge on the beam emittance. Time-resolved measurements of beam current and voltage have been made. In addition, a streak camera was used to measure beam emittance and spatial profile. Comparisons of measurements with simulations are presented.

27200 (LA-UR-93-1727) **A miniature modular MCA for gamma-ray spectroscopy.** Sprinkle, J.K. Jr. (Los Alamos National Lab., NM (United States)); Halbig, J.K.; Klosterbuer, S.F.; Russo, P.A.; Smith, S.E. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930533-8: 15. annual symposium of the European Safeguards Research and Development Association: safeguards and nuclear materials management, Rome (Italy), 11-13 May 1993). Order Number DE93014579. Source: OSTI; NTIS; INIS; GPO Dep.

A wide variety of user requirements in nondestructive assay field applications can be satisfied by carefully specifying a small number of standardized hardware and software modules and their interfaces. Examples of this philosophy will be presented with a novel, small multichannel analyzer (M^3CA) as 10 cm by 20 cm by 9 cm and includes a detector bias supply, amplifier, and battery.

27201 (LA-UR-93-1752) **First results from PHAROS, the new chopper spectrometer at LANSCE.** Olivier, B.J.; Sandoval, J.P.; Lysaght, P.; Nutter, M.; Robinson, R.A. Los Alamos National Lab., NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9305177-4: 12. International collaboration of advanced neutron sources meeting (ICANS), Abingdon (United Kingdom), 24-28 May 1993). Order Number DE93014572. Source: OSTI; NTIS; INIS; GPO Dep.

In this article we present the first experimental measurements obtained on PHAROS during the 1992 run cycle at LANSCE. These are data on the phasing of the choppers relative to the accelerator system along with the consequent neutronic resolution, data on the real-space position resolution of the main detectors, a white-beam nickel powder calibration, and our first inelastic scattering measurement made on TiH_2 with an incident energy of 300 MeV. The characteristic features of the new chopper spectrometer PHAROS, designed for low-angle inelastic neutron scattering and neutron Brillouin scattering, are described elsewhere in these proceedings.

27202 (LBL-32612) **Scintillating tile fabrication for the 4 x 4 calorimeter test station module.** Hoff, M.D. Lawrence Berkeley Lab., CA (United States). 23 Jun 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015288. Source: OSTI; NTIS; INIS; GPO Dep.

Short communication. SHOWER COUNTERS/design; SHOWER COUNTERS/plastic scintillators; PLASTIC SCINTILLATORS/fabrication; DESIGN; FABRICATION

27203 (LIYaF-1714) **Spark discharge guided by high energy particles beams.** Bekker, A.M.; Kozlov, V.S.; Ksenofontov, O.P.; Miroshkin, V.V.; Stabnikov, M.V.; Tarakanov, V.I. AN SSSR, Leningrad (Russian Federation). Inst. Yadernoj Fiziki. 1991. [18p.] (In Russian). Order Number DE93629762. Source: OSTI; NTIS (US Sales Only); INIS.

The features of a long-gap (some 10 cm) spark discharge in air and nitrogen with gas ionization induced by collimated beam of 300 MeV electrons have been studied experimentally. It is shown that the certain conditions are bound to be realized to make the discharge develop strictly along the beam axes. The main experimental results showing the mechanisms of discharge quiding are presented. Qualitative interpretation of the phenomena observed is proposed. Some approaches to the creation of the phenomenological model of a gas discharge are outlined. 8 refs.; 9 figs.

27204 (OEFZS-4663) **Investigations on commercial semiconductor diodes as possible high dose rate radiation detectors.** Breitenhuber, L. (Technische Univ., Graz (Austria). Inst. fuer Kernphysik); Kindl, P.; Obenaus, B.; Duftschmid, K.; Strachotinsky, C. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Dec 1992. [37p.] (In German). Order Number DE93628343. Source: OSTI; NTIS (US Sales Only); INIS.

Provided with ISSN 0253-5270.

Investigations concerning the relevant properties of commercial semiconductor diodes such as their sensitivity and its dependence on accumulated dose, dose rate, energy, temperature and direction have been made in order to obtain their usefullness as radiation detectors. (authors).

27205 (ORNL/TM-12311) **Analysis of anomalous data produced by Harshaw Model 8801 thermoluminescent dosimeter cards.** Sonder, E.; Ahmed, A.B. Oak Ridge National Lab., TN (United States). May 1993. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93015757. Source: OSTI; NTIS; INIS; GPO Dep.

A large number of dosimeters that have produced abnormal data during field assignment have been stored, reirradiated, and studied. Results are summarized and comparisons are made with normal dosimeters. Summarized here are anomalous glow curve shapes, distributions of anomalies in the residual luminescent responses, and historical and repeat-irradiation behavior of abnormal dosimeters. The results indicate that by far the most frequent abnormal data involve elevated readings from Chip 3, accompanied by excess luminescence at temperatures higher than that of the normal radiation produced band. There is no sharp division between normal and abnormal dosimeters (dosimeters yielding excess luminescence at high temperature). Rather, dosimeters exhibit a continuum of behavior from very good (little high temperature luminescence) to clearly abnormal behavior. The excess luminescence emitted at high temperature in abnormal dosimeters is not

proportional to absorbed dose; it has a radiation-independent average value that depends on the dosimeter but varies erratically above and below that average for consecutive anneals. At relatively high radiation exposures (>100 mR), the amount of excess high temperature luminescence becomes unimportant and abnormal data are rare.

27206 (SSCL–601) **3D-Flow processor for a programmable Level-1 trigger (feasibility study).** Crosetto, D. Superconducting Super Collider Lab., Dallas, TX (United States). Oct 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE93016045. Source: OSTI; NTIS; INIS; GPO Dep.

A feasibility study has been made to use the 3D-Flow processor in a pipelined programmable parallel processing architecture to identify particles such as electrons, jets, muons, etc., in high-energy physics experiments.

27207 (SSCL–607) **General programmable Level-1 trigger with 3D-Flow assembly system for calorimeters of different sizes and event rates.** Crosetto, D. Superconducting Super Collider Lab., Dallas, TX (United States). Dec 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE93013944. Source: OSTI; NTIS; INIS; GPO Dep.

Experience demonstrates that fine tuning on the trigger of an experiment is often achieved only after running the experiment and analyzing the first data acquired. It is desirable that identification and, consequently, selection of interesting events be made on a more refined identification of particles. Use of an innovative parallel-processing system architecture together with an instruction set allows identification of objects (particles) among the data coming from a calorimeter in a programmable manner, utilizing the information related to their shape in two- or three-dimensional form, rather than applying only a programmable threshold proportional to their energy. The architecture is flexible, allowing execution of simple algorithms as well as complex pattern recognition algorithms. It is scalable in the sense that the same hardware can be used for small or large calorimeters having a slow or fast event rate. The simple printed circuit board (accommodating 16 x 3D-Flow processors) on a 4 in. x 4 in. board described herein uses the same hardware to build a large Level-1 programmable trigger (by interconnecting many boards in a matrix array) and is capable of implementing simple or complex pattern recognition algorithms at different event input rates (by cascading boards one on top of another). With the same hardware one can build low-cost, programmable Level-1 triggers for a small and low-event-rate calorimeter, or high-performance, programmable Level-1 triggers for a large calorimeter capable of sustaining up to 60 million events per second.

27208 (SSCL-Preprint–211) **An engineering design study of the support platform assembly for the SSC SDC detector.** Krebs, H.J. (Superconducting Super Collider Lab., Dallas, TX (United States)); Western, J.L.; Wands, R.H. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–29: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014162. Source: OSTI; NTIS; INIS; GPO Dep.

A large angular acceptance high energy physics particle detector is presently being designed by the Solenoidal Detector Collaboration for the purposes of doing high pt physics at the Superconducting Super Collider Laboratory. The support platform assembly is the structural device which transfers the 30,000 tonne gravitational load of the octagonally shaped muon barrel toroid and the other detector components to the foundation below. The detector components are very sensitive to differential deflection and rely on the barrel toroid and support platform for stability. The operational load path is provided by two pairs of inclined longitudinal plates resting at 67.5° on three pairs of plate girders that are positioned in-line in Z. The plate girders are held together laterally with 38 tie bars and supported vertically by the vertical adjustment system. The lateral stability of the inclined plates is provided by 22 stabilizer beams with cross bracing between each beam. The Z location of each split in the plate girder is coincident with the Z location of the gap in the calorimeter (4428 nun from the detector center.) The width of each split is 155 mm to allow installation of the alignment reference system. The collider beam line in the IR-8 underground experimental hall is oriented at a 2.16 mm/m slope from south to north as shown in Figure 2. The support is designed and installed to provide this slope at the top surface of the inclined plates. The assembled support rests on a ten foot thick steel reinforced 8000 psi concrete slab. The slab has a 2 mm differential deflection criteria under nominal gravitational loading.

27209 (SSCL-Preprint–293) **Overview of the superconducting magnet subsystem for the GEM detector at the SSC.** Deis, G. (Lawrence Livermore National Lab., CA (United States)); Bowers, J.; Chargin, A.; Heim, J.; House, A.; Johnson, C.; Oberst, G.; Pedrotti, L.; Swan, J.; Warren, R.; Wineman, S.; Yamamoto, R.; Camille, R.; East, G.; Marston, P.; Minervini, J.; Myatt,Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–14: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014104. Source: OSTI; NTIS; INIS; GPO Dep.

The SSC Laboratory plans to deploy two "large" detectors for the essential high-energy physics experiments at the initial startup of the collider. The GEM detector is optimized to emphasize precise measurement of photons and electrons, as well as precise tracking of high-energy muons. An essential part of the GEM detector is the magnet subsystem, which provides the magnetic field necessary for identification and high-resolution tracking of charged particles. This large superconducting magnet system, with ferromagnetic field-shapers, presents a variety of engineering challenges in superconductor technology, in magnet-winding technology, fabrication, assembly and installation of large and heavy components, and in ensuring the required high operating availability.

27210 (SSI–93-04) **Reference instrument for continuous radon measurement.** Moere, Hans. Swedish Radiation Protection Inst., Stockholm (Sweden). Jan 1993. [25p.] (In Swedish). Order Number DE93631537. Source: OSTI; NTIS; INIS.

A reference instrument for calibration of equipment used for continuous measurement of radon has been constructed. It is based on electrostatic precipitation and alpha spectroscopy of the radon daughter products.

27211 (UCRL-ID–111750) **A high-sensitivity neutron counter and waste-drum counting with the high-sensitivity neutron instrument.** Hankins, D.E.; Thorngate, J.H. Lawrence Livermore National Lab., CA (United States). Apr 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014370. Source: OSTI; NTIS; INIS; GPO Dep.

At Lawrence Livermore National Laboratory (LLNL), a highly sensitive neutron counter was developed that can detect and accurately measure the neutrons from small quantities of plutonium or from other low-level neutron sources. This neutron counter was originally designed to survey waste containers leaving the Plutonium Facility. However, it has proven to be useful in other research applications requiring a high-sensitivity neutron instrument.

27212 (UCRL-ID–113825) **Engineering elements of the muon alignment system.** Sawicki, R. Lawrence Livermore National Lab., CA (United States). 18 Feb 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014375. Source: OSTI; NTIS; GPO Dep.

The muon alignment system is a complex arrangement of straight line monitors integrated with numerous, high specific stiffness detection chambers and a large, low resonant frequency, aluminum support structure. The precision tolerances with which all of these components must be installed, aligned and maintained requires meticulous and integrated analysis and design of all of the subsystems. This report summarizes the status of the engineering effort that has been completed and a status of the design in general. At present. there is an overall concept that addresses and provides reasonable engineering solutions to all of the primary

alignment challenges. Precision measurement accuracies can be achieved with equipment proven with either off-the-shelf equipment or with technologies that have been successfully demonstrated in full-scale laboratory experiments. The stability of the structures have been analyzed and determined to be capable of satisfying the alignment tolerances. And a top level alignment sequence has been identified that permits rapid, and efficient installation of the alignment system in a very tight timetable. Although many engineering details remain to be completed and changes will occur as the design of all of the systems mature, a basic concept and philosophy has been established and is defined in this report.

27213 (UCRL-JC–105283) **Nonconventional methods for accurately calibrating germanium detectors.** Gunnink, R.; Prindle, A.L. Lawrence Livermore National Lab., CA (United States). 1 Apr 1991. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-910422–11: International topical conference on methods and applications of radioanalytical chemistry II (MARC-2), Kona, HI (United States), 21-27 Apr 1991). Order Number DE93015113. Source: OSTI; NTIS; GPO Dep.

We have developed two nonconventional but complementary methods whereby the detector efficiency of a coaxial germanium detector can be determined within an accuracy of a few percent for the energy region from 0.05 to 4.0 MeV without using conventional radioactive standards.

27214 (UCRL-JC–109421) **Measurements of optical properties of waveshifting optical fiber for liquid scintillator hadron calorimetry.** Cochran, C.; Lowry, M.; Wuest, C.; Armatis, P.; Graham, G.; Ables, E. Lawrence Livermore National Lab., CA (United States). Sep 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920792–52: Society of Photo-Optical Instrumentation Engineers (SPIE) international symposium on optical applied science and engineering, San Diego, CA (United States), 19-24 Jul 1992). Order Number DE93012606. Source: OSTI; NTIS; GPO Dep.

Measurements have been made on optical properties of Bicron BCF-91 waveshifting optical fiber. This fiber is proposed as a means of converting UV and blue light emitted from liquid scintillator when exposed to ionizing radiation. The conversion is accomplished by coiling the fiber in a reservoir filled with liquid scintillator and coated internally with reflective paint. UV and blue light is absorbed by the waveshifting dyes in the fiber and reemitted light is channeled into the core of the fiber and output to photo detectors. It has been proposed to outfit the hadron calorimeter sub-system of the GEM detector to be built at the Superconducting Super Collider with 800,000 separate liquid scintillator/waveshifting fiber cells. The measurements described in this work deal with the optical performance of the fiber: spectral emission, response as a function of input wavelength, response as a function of irradiated length, propagation length and output numerical aperture. The theoretical response of an ideal calorimeter cell is studied based on the results of the measurements presented.

27215 (UCRL-JC–111941) **An x-ray detector using superconducting aluminum tunnel junctions.** Barber, W.C. (San Francisco State Univ., CA (United States). Dept. of Physics and Astronomy); Bland, R.W.; Carpenter, J.W.; Johnson, R.T.; Laws, K.E.; Lockhart, J.; Lee, J.S.; Watson, R.M.; Labov, S.E.; Cunningham, C.E.; LeGros, M.A.; Mears, C.A.; Morris,.Lawrence Livermore National Lab., CA (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;FG03-92ER40711. (CONF-920792–63: 37. annual Society of Photo-Optical Instrumentation Engineers (SPIE) international symposium on optical and optoelectronic applied science and engineering, San Diego, CA (United States), 19-24 Jul 1992). Order Number DE93015103. Source: OSTI; NTIS; INIS; GPO Dep.

We report on tests of a prototype detector for 6-keV X-rays, using series arrays of tunnel junction. Tests with higher-energy particles indicate an energy resolution of 4 keV, at 0.3K and with a warm pre-amp. At lower temperatures and with a cooled FET, the resolution should approach 100 eV.

4402 Radiation Effects On Instrument Components, Instruments, Or Electronic Systems

27216 (INT–248/PS) **Fast neutron damage of silicon pin photodiodes.** Dabrowski, W.; Korbel, K.; Skoczen, A. Institute of Physics and Nuclear Techniques, Cracow (Poland). 1990. [26p.] Programme CPBP 01.09. Order Number DE93629782. Source: OSTI; NTIS (US Sales Only); INIS.

A Hamamatsu Photonics photodiode S1723 was tested with respect to the fast neutron radiation. The device was irradiated with neutrons of energies in the range of 0.5 MeV to 12 MeV from a Po-Be source. The irradiation was performed in several steps starting from the relatively low fluence of 2.5×10^{10} n x cm^{-2}. The following characteristics were measured: leakage current vs bias voltage, capacitance vs bias voltage and vs frequency, noise vs time constant of a quasigaussian shaper and spectral density of noise. Significant changes of the leakage current and of the noise were observed at the fluence of neutrons as low as 2.5×10^{10} n x cm^{-2}. 8 figs., 3 tabs., 15 refs. (author).

4404 Well Logging Instrumentation

27217 **Compact acoustic refrigerator.** Bennett, G.A. To Dept. of Energy. 1991. Filed date 4 Jun 1991. USA patent application 7-710,207. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93015703. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of a compact acoustic refrigeration system that actively cools components, e.g., electrical circuits, in a borehole environment. An acoustic engine includes first thermodynamic elements for generating a standing acoustic wave in a selected medium. An acoustic refrigerator includes second thermodynamic elements located in the standing wave for generating a relatively cold temperature at a first end of the second thermodynamic elements and a relatively hot temperature at a second end of the second thermodynamic elements. A resonator volume cooperates with the first and second thermodynamic elements to support the standing wave. To accommodate the high heat fluxes required for heat transfer to/from the first and second thermodynamic elements, first heat pipes transfer heat from the heat load to the second thermodynamic elements and second heat pipes transfer heat from first and second thermodynamic elements to the borehole environment.

This report discusses pulse propagation in inhomogeneous optical waveguides and fibers.

27219 (LA-UR–93-1449) **Polarization effects in optical fiber current sensors based on Sagnac interferometers with 3×3 couplers.** Rochford, K.B. (National Inst. of Standards and Technology, Boulder, CO (United States)); Day, G.W.; Forman, P.R. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930588–2: 9. optical fiber sensors conference, Firenze (Italy), 4-6 May 1993). Order Number DE93012665. Source: OSTI; NTIS; GPO Dep.

Response functions of an ideal Sagnac optical fiber cut-rent sensor based on a 3×3 coupler fundamentally depend on the polarization state of light catering coupler, even for a zero birefringence system. The desired response functions, cosinusoids

separated by 120° phase shifts, are obtained only for circularly polarized light. The response functions for linearly polarized and depolarized inputs are cosinusoids separated by 180°, and yield only zero- slope small-signal responses. Also, two outputs are degenerate, so that the response is similar to that observed in 2×2 systems. Thus, 3×3 couplers offer no advantage over 2×2 systems for linear polarized light. This result increases system complexity in that polarization control optics are required to supply the proper polarization, even for an ideal, zero-birefringence system.

27220 (ORNL/FTR–4634) **Travel to England and the Netherlands for a performance evaluation of scanning and electron microscopes equipped with field emission guns: Foreign trip report, April 27–May 5, 1993.** Kenik, E.A.; Bentley, J. Oak Ridge National Lab., TN (United States). 2 Jun 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93016671. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Comprehensive tests of imaging and analytical performance of two scanning electron microscopes and a 200-kV transmission electron microscope, each equipped with Schottky field emission guns, were performed with a variety of special test specimens and ones typically encountered in current research at Oak Ridge National Laboratory. The test results will be invaluable in guiding future acquisitions of such instruments. Discussions at Delft Technological University provided information on important instrumentation projects well in advance of general publication.

27221 (ORNL/FTR–4650) **Travel to Japan for a performance evaluation of the Hitachi HF2000 cold field emission gun analytical electron microscope: Foreign trip report, May 16–22, 1993.** Bentley, J. Oak Ridge National Lab., TN (United States). 18 Jun 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93016672. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Comprehensive tests of imaging and analytical performance of the Hitachi HF2000 cold field emission gun (FEG) analytical electron microscope (AEM) were performed with a variety of special test specimens and ones typically encountered in current research at Oak Ridge National Laboratory (ORNL). The test results will be invaluable in guiding future acquisitions of high-performance AEMs. Visits to the Central and Advanced Research Laboratories of Hitachi, Ltd., provided much useful information on important electron microscopy instrumentation projects and research.

27222 (UCRL-ID–113834) **Barium fluoride research and development at Lawrence Livermore National Laboratory.** Wuest, C.R.; Fuchs, B.A.; Kway, W. Lawrence Livermore National Lab., CA (United States). 24 Jul 1992. 127p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014682. Source: OSTI; NTIS; GPO Dep.

Lawrence Livermore National Laboratory (LLNL) has been asked to provide R&D on new methods of barium fluoride (BaF_2) crystal surface preparation, as well as optical coating methods to improve the efficiency of transport of scintillation light through the crystal to the photodetector. The goal of the R&D is to identify a method (or methods) for preparing the surface to eliminate the amorphous layer that has been found to be a product of the surface preparation techniques used when the crystals are manufactured in China and provide a crystalline surface free from oxygen and other contamination, with suitable flatness for optical coating. UV reflective coatings have been identified that are suitable for the wavelengths of the scintillation light (220 nm peak). The coating consists of a layer of aluminum with a magnesium fluoride over-layer. This coating can be applied in a uniform layer or in a graded layer, with reflectance varying as a function of position. It is ultimately desired that the UV coating be applied with graded reflectance to linearize the response of the crystal along its length.

27223 (UCRL-JC–109219-Rev.2) **Tip-tilt compensation: Resolution limits for ground-based telescopes using laser guide star adaptive optics: Revision 2.** Olivier, S.S.; Max, C.E.; Gavel, D.T.; Brase, J.M. Lawrence Livermore National Lab., CA (United States). 8 Oct 1992. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9203139–5-Rev.2: Laser guide star adaptive optics workshop, Albuquerque, NM (United States), 10-12 Mar 1992). Order Number DE93016426. Source: OSTI; NTIS; INIS; GPO Dep.

The angular resolution of long-exposure images from ground-based telescopes equipped with laser guide star adaptive optics systems is fundamentally limited by the the accuracy with which the tip-tilt aberrations introduced by the atmosphere can be corrected. Assuming that a natural star is used as the tilt reference, the residual error due to tilt anisoplanatism can significantly degrade the long-exposure resolution even if the tilt reference star is separated from the object being imaged by a small angle. Given the observed distribution of stars in the sky, the need to find a tilt reference star quite close to the object restricts the fraction of the sky over which long-exposure images with diffraction limited resolution can be obtained. In this paper, the authors present a comprehensive performance analysis of tip-tilt compensation systems that use a natural star as a tilt reference, taking into account properties of the atmosphere and of the Galactic stellar populations, and optimizing over the system operating parameters to determine the fundamental limits to the long-exposure resolution. Their results show that for a ten meter telescope on Mauna Kea, if the image of the tilt reference star is uncorrected, about half the sky can be imaged in the V band with long-exposure resolution less than 60 milli-arc-seconds (mas), while if the image of the tilt reference star is fully corrected, about half the sky can be imaged in the V band with long-exposure resolution less than 16 mas. Furthermore, V band images long-exposure resolution of less than 16 mas may be obtained with a ten meter telescope on Mauna Kea for unresolved objects brighter than magnitude 22 that are fully corrected by a laser guide star adaptive optics system. This level of resolution represents about 70% of the diffraction limit of a ten meter telescope in the V band and is more than a factor of 45 better than the median seeing in the V band on Mauna Kea.

27224 (UCRL-JC–112671) **Laser beam control and diagnostic systems for the copper-pumped dye laser system at Lawrence Livermore National Laboratory.** Bliss, E.S.; Peterson, R.L.; Salmon, J.T.; Thomas, R.A. Lawrence Livermore National Lab., CA (United States). Nov 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930159–41: OE/LASE '93: International Society for Optical Engineering (SPIE) conference, Los Angeles, CA (United States), 16-23 Jan 1993). Order Number DE93016529. Source: OSTI; NTIS; GPO Dep.

The laser system described in the previous paper is used for experiments in which success requires tight tolerances on beam position, direction, and wavefront. Indeed, the optimum performance of the laser itself depends on careful delivery of copper laser light to the dye amplifiers, precise propagation of dye laser beams through restricted amplifier apertures, and accurate monitoring of laser power at key locations. This paper describes the alignment systems, wavefront correction systems, and laser diagnostics systems which ensure that the control requirements of both the laser and associated experiments are met. Because laser isotope separation processes utilize more than one wavelength, these systems monitor and control multiple wavelengths simultaneously.

27225 (UCRL-JC–113273) **Imaging Fourier Transform Spectrometer.** Bennett, C.L.; Carter, M.R.; Fields, D.J.; Hernandez, J. Lawrence Livermore National Lab., CA (United States). 14 Apr 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930445–18: Society of Photo-Optical Instrumentation Engineers (SPIE) OE/aerospace science and sensing meeting, Orlando, FL (United States), 11-16 Apr 1993). Order Number DE93017193. Source: OSTI; NTIS; GPO Dep.

The operating principles of an Imaging Fourier Transform Spectrometer (IFTS) are discussed. The advantages and disadvantages of such instruments with respect to alternative imaging spectrometers are discussed. The primary advantages of the IFTS are the capacity to acquire more than an order of magnitude more spectral channels than alternative systems with more than an order of magnitude greater etendue than for alternative systems. The primary disadvantage of IFTS, or FTS in general, is the sensitivity to temporal fluctuations, either random or periodic. Data from the IRIFTS

(ir IFTS) prototype instrument, sensitive in the infrared, are presented having a spectral sensitivity of 0.01 absorbance units, a spectral resolution of 6 cm^{-1} over the range 0 to 7899 cm^{-1}, and a spatial resolution of 2.5 mr.

4407 Geophysical and Meteorological Instrumentation

27226 (USGS-OFR–93-187) **A portable vacuum hammer seismic source for use in tunnel environments.** Carroll, R.D.; Magner, J.E. Geological Survey, Denver, CO (United States). 1993. 37p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93015498. Source: OSTI; NTIS; US Geological Survey, Books and Open-File Reports Section, Box 25425, Federal Center, Denver, CO 80225 (US); GPO Dep.

Concern for the measurement of seismic refraction velocities in tunnel areas where cables, construction features, and other sensitive structures render the use of dynamite sources unwise, resulted in the design of a vacuum-driven impact system utilizing a 43-kg (94-lb) weight in a 2-m (6.5-ft) tube. The system is portable, quickly assembled and disassembled, and requires only standard electrical power, an air pressure supply, and a laboratory vacuum pump to operate. The maximum weight of any component is 84 kg (185 lb), the remaining components being significantly lighter. Tests in volcanic rock tunnels in Rainier Mesa at the Nevada Test Site indicate maximum energy generated by the system is in the SV wave. When the system was employed at angles other than vertical, a polarized SH mode was also observed. The hammer was used to obtain velocities in an in-hole survey in a 138-m horizontal hole drilled behind the flat face of the Red Hot chamber after the Red Hot nuclear detonation. A large decrease was observed in compressional velocity compared with pre-event values. Because 20 years have elapsed since the explosion, one cannot separate the effect of ground shock on lowering the velocity from possible effects of destressing around adjacent underground openings over this period.

27227 (LA-UR–93-1523) **High-speed imaging of blood splatter patterns.** McDonald, T.E. (Los Alamos National Lab., NM (United States)); Albright, K.A.; King, N.S.P.; Yates, G.J.; Levine, G.F. Los Alamos National Lab., NM (United States). [1993]. 6p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9306163–1: Items '93: an imaging technology conference and exposition, Washington, DC (United States), 6-10 Jun 1993). Order Number DE93012739. Source: OSTI; NTIS; GPO Dep.

The interpretation of blood splatter patterns is an important element in reconstructing the events and circumstances of an accident or crime scene. Unfortunately, the interpretation of patterns and stains formed by blood droplets is not necessarily intuitive and study and analysis are required to arrive at a correct conclusion. A very useful tool in the study of blood splatter patterns is high-speed photography. Scientists at the Los Alamos National Laboratory, Department of Energy (DOE), and Bureau of Forensic Services, State of California, have assembled a high-speed imaging system designed to image blood splatter patterns. The camera employs technology developed by Los Alamos for the underground nuclear testing program and has also been used in a military mine detection program. The camera uses a solid-state CCD sensor operating at approximately 650 frames per second (75 MPixels per second) with a microchannel plate image intensifier that can provide shuttering as short as 5 ns. The images are captured with a laboratory high-speed digitizer and transferred to an IBM compatible PC for display and hard copy output for analysis. The imaging system is described in this paper.

27228 (SAND–92-2210C) **Non-scanned LADAR imaging and applications.** Anthes, J.P.; Garcia, P. Pierce, J.T.; Dressendorfer, P.V. Sandia National Labs., Albuquerque, NM (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930445–14: Society of Photo-Optical Instrumentation Engineers (SPIE) OE/aerospace science and sensing meeting, Orlando, FL (United States), 11-16 Apr 1993). Order Number DE93013772. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A scannerless LAser Detection And Ranging (LADAR) system is presently in development for applications at Sandia National Laboratories. This LADAR design eliminates the need for a mechanical laser beam scanner which is often the system component that limits the use of laser radars for many applications. Range to the target scene is determined in this approach by measuring the phase shift of the intensity modulation on the received optical return compared to the reference. The approach used in this LADAR is unique because the method used to detect this phase shift is an array of time integrating detectors that also records the image of the target scene. An analytical model will be presented that describes the LADAR system performance. Applications of this LADAR system will also be reviewed. They include terminal guidance of advanced conventional munitions, perimeter surveillance of secure facilities, mapping potholes/cracks in the US highway system for improved maintenance scheduling, active collision avoidance of commercial/private vehicles, robotic vision integrated into advanced manufacturing concepts, and a novel airborne multisensor system containing LADAR, SAR, and LIDAR to locate and measure the thickness of ocean oil spills.

27229 (SAND–92-2816) **Calibration of a magnetic induction system for measurement of hypervelocities.** Breeze, S.P. Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013949. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A device to measure the velocity and to determine the character of a material launched in a flight tube during the execution of an experiment has been constructed. This measurement devise provides a self generating signal, is nonintrusive, compact, and accurate. The signals are reproducible, and it is relatively inexpensive to procure. The MAgnetic Velocity Induction System (MAVIS) has been the technique used to measure projectile velocities in the two-stage light gas gun at Sandia for many years. Several experiments were conducted to study the MAVIS data signatures produced by various metal projectiles at velocities raging from 0.8 km/sec to nearly 7.0 km/sec, as well as fragmented metal projectiles, and a highly conductive carbon plasma. This report deals with the results of those calibration experiments. The data signature study may be used as an aid in the interpretation of the other test data records.

27230 (SAND–93-0370C) **Determination of equivalent circuit for PVDF shock-pressure gauges.** Kotulski, J.D.; Anderson, M.U.; Brock, B.C.; Gomez, J.; Graham, R.A.; Vittitoe, C.N. Sandia National Labs., Albuquerque, NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9306167–8: 14. international conference on high pressure science and technology and 1993 technical meeting of the topical group on shock compression of condensed matter, Colorado Springs, CO (United States), 28 Jun - 3 jul 1993). Order Number DE93016492. Source: OSTI; NTIS; GPO Dep.

Broadband impedance measurements of a PVDF shock-pressure gauge are used to build an equivalent circuit for the gauge. The essential components are a gauge capacitance and a low-loss transmission line. Component features are consistent with the physical characteristics. With knowledge of this circuit, troublesome oscillations can be anticipated and prevented.

27231 (UCRL-ID–113844) **DATAA: Data acquisition made easy: A general purpose data acquisition program for digital oscilloscopes and digital data recorders.** Hodgin, R.L. Lawrence Livermore National Lab., CA (United States). Oct 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014683. Source: OSTI; NTIS; GPO Dep.

'DATAA' was written to fill the need for a versatile, general purpose data acquisition program for digital scopes and data recorders. Unfortunately, a 'GPIB' software standard was only recently developed for such instruments. For operating the older, pre-standard digital scopes, different software for each instrument is usually required. The concept for this program is that the operator controls the instrument settings. The computer controls the data acquisition. 'Let the operator do what he does best, let the computer do what it does best.' In a research environment, the diagnostic setup requirements are constantly changing. Reliable, reproducible data is essential. 'DATAA' accomplishes this task. Data is automatically stored, with setup information being included with each data file. A plotting routine allows for easy examination of all data. For hardcopies, data files are printed at 300DPI to a Laser Jet printer. This report contains a brief description of each main command. Included are figures showing the main display screens, and sample waveform charts.

27232 (UCRL-ID–114251) **Passive tracking of a target using an array of sensors.** Buhl, M. Lawrence Livermore National Lab., CA (United States). May 1993. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93015870. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The problem of passively tracking a moving signal source has importance in a variety of applications such as radar, sonar, seismology, and radio astronomy. In an attempt to aid in the understanding of such problems, a passive tracking algorithm has been developed using PV-Wave, version 3.10. The objective of this document is to present this algorithm, thereby allowing others to further investigate such problems.

27233 (UCRL-JC–111801) **Imaging microscopy with x-ray lasers at LLNL.** Da Silva, L.B. (Lawrence Livermore National Lab., CA (United States)); Trebes, J.E.; Mrowka, S.; MacGowan, B.J.; Koch, J.A.; Matthews, D.L.; Barbee, T.W. Jr.; Balhorn, R.; Gray, J.; Andersen, E.; Kern, D.; Attwood, D. Lawrence Livermore National Lab., CA (United States). 28 Jul 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920792–59: Society of Photo-Optical Instrumentation Engineers (SPIE) international symposium on optical applied science and engineering, San Diego, CA (United States), 19-24 Jul 1992). Order Number DE93013419. Source: OSTI; NTIS; GPO Dep.

Imaging microscopy with short pulse (200 ps) x-ray lasers offers the opportunity of high resolution three-dimensional imaging of specimens in an aqueous environment without the blurring effects associated with natural motion. As a first step towards this goal we have performed imaging, experiments which clearly resolved 500 A features on a gold test pattern. In addition, we have taken images of dried biological specimens as a basis for comparison in future wet specimen imaging. Results of these experiments will be described. We also discuss some of the alignment problems involved in doing x-ray microscopy with low rep rate systems where in situ focusing of the imaging optics is not practical as single shot exposures can alter the specimen.

27234 (KCP–613-5125) **Pin grid arrays: Final report.** Obenland, D.R. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Jun 1993. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE93016579. Source: OSTI; NTIS; GPO Dep.

The evolution of electronic assemblies towards smaller packaging requirements has led to the need to investigate the potential of incorporating higher density packaging in the form of pin grid arrays (PGAs) for weapons hardware. This study investigated the processes required to pretin, solder, and rework PGA solder terminations.

27235 (LA-UR–93-1367) **Use of the new Los Alamos Pulsed Intense X-Ray (PIXY) for deep-penetration radiography in conventional munitions research and development.** Fradkin, D.B.; Sullivan, G.W.; Stout, L.E. Los Alamos National Lab., NM (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9303128–2: 6. test technology symposium, Baltimore, MD (United States), 30 Mar 1993). Order Number DE93012685. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Pulsed Intense X-Ray machine, PIXY, is a state-of-the-art, flash x-ray machine recently installed at the Los Alamos National Laboratory (LANL). In today's environment of reduced fiscal resources, accurate computer modeling is being used to reduce the number of experimental tests required in research and development. Deep-penetration radiography is an excellent diagnostic tool for bench-marking hydro and finite-element computer codes. PIXY will be a cost-effective diagnostic tool for development and performance testing of future weapons systems. Examples of its use in conventional munitions research and development are presented.

27236 (MLM–3784) **Security guide for subcontractors.** Adams, R.C. Mound, Miamisburg, OH (United States). Jun 1993. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-88DP43495. Order Number DE93017107. Source: OSTI; NTIS; GPO Dep.

This guide is provided to aid in the achievement of security objectives in the Department of Energy (DOE) contractor/subcontractor program. The objectives of security are to protect information that, if released, would endanger the common defense and security of the nation and to safeguard plants and installations of the DOE and its contractors to prevent the interruption of research and production programs. The security objective and means of achieving the objective are described. Specific security measures discussed in this guide include physical barriers, personnel identification systems, personnel and vehicular access control, classified document control, protection of classified matter in use, storing classified matter, and repository combinations. Means of dealing with security violations and security infractions are described. Maintenance of a security education program is discussed. Also discussed are methods of handling clearance terminations, visitor control, travel to sensitive countries, and shipment security. The Technical Surveillance Countermeasures Program (TSCM), the Computer Security Program, and the Operations Security Plan (OPSEC) are examined.

27237 (PNL-SA–22163) **Attached charge.** Cliff, W.C. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 3p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9303163–1: American Defense Preparedness Association course, Ft. Walton Beach, FL (United States), 22-26 Mar 1993). Order Number DE93013151. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In 1989 a successful feasibility demonstration was carried out by PNL for the Tank Main Armament System of the US Army. These tests conclusively showed that the attached charges remained with the projectiles throughout the travel down the barrel. The test system employed a Very High Burn Rate cast propellant affixed in the rear of 16 pound 120 mm projectiles in a cigarette burn configuration. The propellants were ignited by the breech propellant and burned continuously through the length of the barrel; and, in fact, at lower pressures, continued burning exterior to the barrel. Such a device can maintain a high base pressure and significantly improve a gun's performance. A next-generation system is being built for the US Navy in which an attached charge canister acts as a pusher system behind the projectile. The attached charge canister is then discarded upon leaving the muzzle. In this system the additional parasitic weight of the attached charge canister is not carried with the projectile and therefore does not influence the projectile aerodynamics. The attached charge concept has applications for large, small and medium caliber gun systems. It has currently been demonstrated on the 120 mm size system as well as a small bore 7.62 mm gun system. It has application for range extension, kinetic energy enhancement, and potentially for use in equation-of-state testing. With the attached charge concept the theoretical launch velocity for the attached charge projectile is principally dependent

on the charge to projectile mass ratio. There is no theoretical upper velocity limit at which a projectile could be launched, such as there is with a conventional propellant.

27238 (SAND–92-1411) **Experimental aerodynamics research on a hypersonic vehicle.** Oberkampf, W.L.; Aeschliman, D.P.; Tate, R.E.; Henfling, J.F. Sandia National Labs., Albuquerque, NM (United States). Apr 1993. 136p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013957. Source: OSTI; NTIS; GPO Dep.

Aerodynamic force and moment measurements and flow visualization results are presented for a hypersonic vehicle configuration at Mach 8. The basic vehicle configuration is a spherically blunted 10° half-angle cone with a slice parallel with the axis of the vehicle. On the slice portion of the vehicle, a flap could be attached so that deflection angles of 10°, 20° and 30° could be obtained. All of the experimental results were obtained in the Sandia Mach 8 hypersonic wind tunnel for laminar boundary layer conditions. Flow visualization results include shear stress sensitive liquid crystal photographs, surface streak flow photographs (using liquid crystals), and spark schlieren photographs and video. The liquid crystals were used as an aid in verifying that a laminar boundary layer existed over the entire body. The surface flow photo-graphs show attached and separated flow on both the leeside of the vehicle and near the flap. A detailed uncertainty analysis was conducted to estimate the contributors to body force and moment measurement uncertainty. Comparisons are made with computational results to evaluate both the experimental and numerical results. This extensive set of high-quality experimental force and moment measurements is recommended for use in the calibration and validation of relevant computational aerodynamics codes.

27239 (SAND–92-1888C) **Parachute system design, analysis, and simulation tool: Status report.** Sundberg, W.D.; McBride, D.D.; Gwinn, K.W.; Waye, D.E.; Hailey, C.E. Sandia National Labs., Albuquerque, NM (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930580–3: 12. Royal Aeronautical Society/American Institute of Aeronautics and Astronautics (RAS/AIAA) aerodynamic decelerator systems technical conference, London (United Kingdom), 10 May 1993; AIAA–93-1208). Order Number DE93013755. Source: OSTI; NTIS; GPO Dep.

For over twenty years designers at Sandia National Laboratories have developed various parachute simulation codes to model deployment, inflation, loading, trajectories, aircraft downwash and line sail. In addition to these codes, material property data bases have been acquired. Recently we have initiated project to integrate these codes and data bases into a single software tool entitled SPARSYS (Sandia PARachute SYstem Simulation). We have constructed a graphical user interface as the driver and framework for SPARSYS. In this paper we present a status report on SPARSYS describing progress in developing and incorporating independent modules, in developing an integrated trajectory package, and in developing a materials data base including high-rate-of-strain data.

27240 (SAND–92-1891C) **Test/analysis correlation and model updating of the STARS I & II missile systems.** Fulcher, C.W.; Marek, E.L.; Mayes, R.L. Sandia National Labs., Albuquerque, NM (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930786–1: 1. Dynamic Testing Agency/National Agency for Finite Element Methods and Standards International conference, Milton Keynes (United Kingdom), 7-9 Jul 1993). Order Number DE93013774. Source: OSTI; NTIS; GPO Dep.

The testing, modeling, and test/analysis correlation of the STARS I & II missile systems is reviewed. The STARS project is described. The system identification methodology is discussed. A series of modal tests designed to characterize the various structural components is summmarized. The development and updating of detailed finite element models, in a test/analysis correlation process, is presented.

27241 (UCRL-ID–113846) **Real time radiography of Titan IV booster.** La Chapell, M.; Turner, D.; Dolan, K.; Perkins, D.; Costerus, B. Lawrence Livermore National Lab., CA (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012450. Source: OSTI; NTIS; GPO Dep.

Lawrence Livermore National Laboratory successfully completed.a real time radiography of the Titan IV booster motor in February 1993. The success of this project depended on the quick response-to Air Force criteria and securing a multi disciplinary team addressing the numerous technical challenges. The team's Challenges included large area imager design and fabrication problems; vibrating mitigation obstacles; sound mitigation dilemmas; high levels of fail safe confidence; and operating a fragile, transportable x-ray linear accelerator. The data was viewed real-time and stored utilizing standard video hardware. The data from the test is presently being analyzed. The multi disciplinary team was presented with many serious technical challenges that needed to be addressed expeditiously. The purpose of this paper is to examine some of the technical issues and how they were executed.

27242 (UCRL-JC–112103) **Computer vision and sensor fusion for detecting buried objects.** Clark, G.A.; Hernandez, J.E.; Sengupta, S.K.; Sherwood, R.J.; Schaich, P.C.; Buhl, M.R.; Kane, R.J.; DelGrande, N.K. Lawrence Livermore National Lab., CA (United States). Oct 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9210231–4: 26. annual Asilomar conference on signals, systems, and computers, Pacific Grove, CA (United States), 25-30 Oct 1992). Order Number DE93012605. Source: OSTI; NTIS; GPO Dep.

Given multiple images of the surface of the earth from dual-band infrared sensors, our system fuses information from the sensors to reduce the effects of clutter and improve the ability to detect buried or surface target sites. Supervised learning pattern classifiers (including neural networks,) are used. We present results of experiments to detect buried land mines from real data, and evaluate the usefulness of fusing information from multiple sensor types. The novelty of the work lies mostly in the combination of the algorithms and their application to the very important and currently unsolved problem of detecting buried land mines from an airborne standoff platform.

27243 (UCRL-JC–112250) **Captive flight testing of a kinetic kill vehicle.** Worrell, R.H. (Strategic Defense Initiative Organization, Washington, DC (United States)); Summers, M.A.; Brugman, V.P.; Weaver, L.F.; Etter, J.R.; Patz, B.J.; Ruiz, Y.V. Lawrence Livermore National Lab., CA (United States). 2 Feb 1993. 27p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9302121–1: American astronomical conference, Keystone, CO (United States), 6 Feb 1993). Order Number DE93014428. Source: OSTI; NTIS; GPO Dep.

An experimental approach for the captive flight ground-testing of a prototypical exoatmospheric kinetic kill vehicle is described. The primary objective of the test is to evaluate target tracking and intercept guidance control algorithms. Test hardware is described, including the vehicle; the suspension, launch, and recovery systems; the hyper-velocity target simulator; and the diagnostics systems. Initial test results are reported.

27244 (LA-UR–93-1421) **Equation of state for detonation products.** Davis, W.C. Los Alamos National Lab., NM (United States). [1993]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930713–8: 10. detonation symposium, Boston, MA (United States), 12-16 Jul 1993). Order Number DE93012671. Source: OSTI; NTIS; GPO Dep.

An equation of state for detonation products, with the usual form $p = p(v,E)$, is proposed. It allows independent calibration of the adiabatic gamma and the Grueneisen gamma, and gives them forms in agreement with recent theoretical studies. The equation of state is given by $p = E/v[k - 1 + F(v) \{1 + b(1 - E/E^s(v))\}]$ where $F(v)$ drops from a finite value at small v to zero at large v, b is a constant, and $E^s(v)$ is the specific internal energy on the principal isentrope. Its relationship to the polytropic gas equation of state p

= $(E/v)(\gamma - 1)$ is easily seen, and it reduces to this form at large volume.

27245 (LA-UR–93-1545) **Detonation reaction steps frozen by free expansion and analyzed by mass spectrometry.** Greiner, N.R.; Fry, H.A.; Blais, N.C.; Engelke, R.P. Los Alamos National Lab., NM (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930713–7: 10. detonation symposium, Boston, MA (United States), 12-16 Jul 1993). Order Number DE93012734. Source: OSTI; NTIS; GPO Dep.

Detonation reactions in small pellets of explosive are frozen by free expansion into a large vacuum chamber and analyzed by time-of-flight mass spectrometry. Sensitive explosives like PETN, RDX, and HMX show rapidly evolving reaction zones and mostly simple products like H_2O, CO, N_2, and CO_2. Less sensitive explosives like TATB, HNS, and TNT show slower evolution of the reaction zone, and more complex products in addition to the simple ones seen in PETN. Isotopic substitution shows that the more complex products contain moderate amounts of NH_3, HCN, NO, HNCO, and NO_2. Other observations include polymerization of aromatic explosive molecules, adducts to the explosive molecules, and explosive molecules with functional groups missing. The more complex products are reservoirs of unreleased energy that may affect performance.

27246 (SAND–92-1910C) **A new look at the run distance correlation and its relationship to other non-steady-state phenomena.** Cooper, P.W. Sandia National Labs., Albuquerque, NM (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930713–17: 10. detonation symposium, Boston, MA (United States), 12-16 Jul 1993). Order Number DE93014991. Source: OSTI; NTIS; GPO Dep.

A review of a portion of the published data on run distance versus input shock pressure led to the formulation of a simple single constant correlation equation: $P^2X = \alpha$. This equation can be used in lieu of the now traditional "Pop-Plot" equation. The advantages provided by this simple form are that "a" is now a quantitative single valued parameter which describes an explosive's shock sensitivity. It also allows for direct correlation to other non-steady-state phenomena such as the critical energy fluence for initiation, the detonation velocity-charge radius effect and the critical or failure diameter.

27247 (UCRL-CR–107172) **Comparison of HOB curves for 0.5-g NP charges with field test data and calculations.** Reichenbach, H. (Fraunhofer-Institut fuer Kurzzeitdynamik - Ernst-Mach-Institut (EMI), Freiburg im Breisgau (Germany)); Scheklinksi-Glueck, G.; Kuhl, A.L. Lawrence Livermore National Lab., CA (United States); Defense Nuclear Agency, Alexandria, VA (United States); Fraunhofer-Institut fuer Kurzzeitdynamik - Ernst-Mach-Institut (EMI), Freiburg im Breisgau (Germany); Logicon R and D Associates, Los Angeles, CA (United States). 31 Aug 1991. 83p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. Contract DNA001-88-C-0046. (RDA-TR–0263229003-001;DNA-TR–90-223). Order Number DE93015009. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Experiments are described on the reflection of spherical blast waves from planar surfaces. The blast waves were created by the detonation of 0.5-g spherical charges of NITROPENTA (NP). The scale of the experiments was about 1/1,000 per kiloton. Diagnostics included schlieren photography and a high-speed pressure measurement system. A parametric series of height-of-burst (HOB) experiments were conducted over hydrodynamically smooth, rough and porous surfaces. Peak pressure measurements were used to construct isobaric HOB curves. The NP curves agree with the HOB curves derived from field tests that utilized much larger HE charges (1 to 500 kg). Nevertheless, comparison with high-fidelity pressure measurements from point-explosion tests and recent hydrocode simulations of the same tests has demonstrated that peak pressures on the NP experiments are about 20% too low in the low-pressure transition region – due to gauge-size limitations. The wave-forms become extremely peaked in this transition region, and gauges with better frequency response are needed to accurately measure the peak pressures.

27248 (UCRL-JC–113577) **Minimization of mixed waste in explosive testing operations.** Gonzalez, M.A.; Sator, F.E.; Simmons, L.F. Lawrence Livermore National Lab., CA (United States). Feb 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930873–1: 2. international mixed waste symposium, Baltimore, MD (United States), 17-20 Aug 1993). Order Number DE93012316. Source: OSTI; NTIS; INIS; GPO Dep.

In the 1970s and 1980s, efforts to manage mixed waste and reduce pollution focused largely on post-process measures. In the late 1980s, the approach to waste management and pollution control changed, focusing on minimization and prevention rather than abatement, treatment, and disposal. The new approach, and the formulated guidance from the US Department of Energy, was to take all necessary measures to minimize waste and prevent the release of pollutants to the environment. Two measures emphasized in particular were source reduction (reducing the volume and toxicity of the waste source) and recycling. In 1988, a waste minimization and pollution prevention program was initiated at Site 300, where the Lawrence Livermore National Laboratory (LLNL) conducts explosives testing. LLNL's Defense Systems/Nuclear Design (DS/ND) Program has adopted a variety of conservation techniques to minimize waste generation and cut disposal costs associated with ongoing operations. The techniques include minimizing the generation of depleted uranium and lead mixed waste through inventory control and material substitution measures and through developing a management system to recycle surplus explosives. The changes implemented have reduced annual mixed waste volumes by more than 95% and reduced overall radioactive waste generation (low-level and mixed) by more than 75%. The measures employed were cost-effective and easily implemented.

A rapid deployment access delay system (RAPADS) has been designed to provide high security protection of valued assets. The system is a vault enclosure that is transportable, modular, and utilizes a pin connection design to attach wall panels together for quick assembly and disassembly. Because of the unique pin connection and overlapping joint arrangement of the wall panels it is possible to construct vaults of various sizes to meet a specific application. In addition, a sequence of assembly steps are required for assembly. As a result, once the door is closed and locked, all pin connections are concealed and inaccessible, providing a high level of protection found only in some permanent vault structures. This report presents the RAPADS concept, design detail highlights, prototype fabrication, and prototype assembly. The RAPADS is readily adaptable to many applications, besides the physical protection of nuclear weapons. These include: protection of sensitive material for government agencies; the protection of weapons, evidence, and documents for drug and law enforcement agencies; and the protection of business property, equipment, and documents in the commercial sector.

27257 (UCRL-JC–113056) **Planning and preliminary design of a contained firing chamber to resist blast effects of 60kg of energetic chemical explosive.** Pastrnak, J.W.; Baker, C.F.; Simmons, L.F. Lawrence Livermore National Lab., CA (United States). Feb 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930681–1: 24. international annual conference of the Fraunhofer Institute of Chemical Technologies, Karlsruhe (Germany), 29 Jun - 2 jul 1993). Order Number DE93014654. Source: OSTI; NTIS; GPO Dep.

The Lawrence Livermore National Laboratory (LLNL) Nuclear Weapons Design Program operates explosive testing facilities at its Site 300 open air explosive test facility. LLNL is developing a blast containment facility to reduce emissions of hazardous materials and reduce the amount of contaminated waste generated from explosive testing of chemical explosives. The firing chamber is designed to contain the blast over pressure and fragment effects from detonations of cased explosive charges up to 60kg of PBX-94042 or an equivalent TNT[3] design weight of 206 lbs. The inside walls of the chamber are protected from high velocity fragments from cased explosive detonations. All structural elements of the firing chamber are designed to remain elastic when subjected to blast to permit repetitive firings. The firing chamber is designed to minimize the release of hazardous material to the environment with a goal of near zero discharge. The objective of this project is to e hazardous emissions to the environment, reduce quantities of hazardous waste, and to provide a continuing capability to test high explosives. We believe this project will be the pace setter in the area of explosive testing technology.

4503 Nuclear Explosion Detection

27258 (LA-UR–92-4409) **Integrated Verification Experiment data collected as part of the Los Alamos National Laboratory's Source Region Program: Appendix C, Infrasonic measurements of IVE events: Los Alamos Source Region Program.** Whitaker, R.W.; Noel, S.D. Los Alamos National Lab., NM (United States). Dec 1992. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93015856. Source: OSTI; NTIS; GPO Dep.

The summary report by Tom Weaver gives the overall background for the series of IVE (Integrated Verification Experiment) experiments including information on the full set of measurements made. This appendix presents details of the infrasound data for the and discusses certain aspects of a few special experiments. Prior to FY90, the emphasis of the Infrasound Program was on underground nuclear test (UGT) detection and yield estimation. During this time the Infrasound Program was a separate program at Los Alamos, and it was suggested to DOE/OAC that a regional infrasound network be established around NTS. The IVE experiments took place in a time frame that allowed simultaneous testing of possible network sites and examination of propagation in different directions. Whenever possible, infrasound stations were combined with seismic stations so that a large number could be efficiently fielded. The regional infrasound network was not pursued by DOE, as world events began to change the direction of verification toward non-proliferation. Starting in FY90 the infrasound activity became part of the Source Region Program which has a goal of understanding how energy is transported from the UGT to a variety of measurement locations.

27259 (LA-UR–93-861) **Ground motions and the infrasound signal: A new model and the discovery of a significant cavity rebound signal: Los Alamos Source Region Program.** Jones, E.M.; App, F.N.; Whitaker, R.W. Los Alamos National Lab., NM (United States). Mar 1993. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93015858. Source: OSTI; NTIS; GPO Dep.

A model is presented that relates infrasound signals from underground nuclear tests to the peak vertical velocity at surface-ground-zero. For the most part, agreement between the model and observations is good, the exceptions being events conducted in shallow tuff layers in Yucca Flat. These events all have low values of the peak surface velocity. The authors have determined that the lack of agreement for these events is due to an unusual, second spall event. A stress-wave calculation is presented that reproduces the second-spall phenomenon and indicates that it is due to interference of cavity-rebound-associated signal with the initial ballistic motion of the surface layers. The effect of the rebound signal is to increase the amplitude of the infrasound signal and thus make low velocity events more detectable.

27260 (LA-UR–93-1615) **Modelling of nuclear explosions in hard rock sites.** Brunish, W.M.; App, F.N. Los Alamos National Lab., NM (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930397–2: Numerical modeling for underground nuclear test monitoring symposium, Durango, CO (United States), 23-25 Mar 1993). Order Number DE93012714. Source: OSTI; NTIS; INIS; GPO Dep.

This study represents part of a larger effort to systematically model the effects of differing source region properties on ground motion from underground nuclear explosions at the Nevada Test Site. In previous work by the authors the primary emphasis was on alluvium and both saturated and unsaturated tuff. We have attempted to model events on Pahute Mesa, where either the working point medium, or some of the layers above the working point, or both, are hard rock. The complex layering at these sites, however, has prevented us from drawing unambiguous conclusions about modelling hard rock. In order to learn more about the response of hard rock to underground nuclear explosions, we have attempted to model the PILEDRIVER event. PILEDRIVER was fired on June 2, 1966 in the granite stock of Area 15 at the Nevada Test Site. The working point was at a depth of 462.7 m and the yield was determined to be 61 kt. Numerous surface, sub-surface and free-field measurements were made and analyzed by SRI. An attempt was made to determine the contribution of spall to the teleseismic signal, but proved unsuccessful because most of the data from below-shot-level gauges was lost. Nonetheless, there is quite a bit of good quality data from a variety of locations. We have been able to obtain relatively good agreement with the experimental PILEDRIVER waveforms. In order to do so, we had to model the granodiorite as being considerably weaker than "good quality" granite, and it had to undergo considerable weakening due to shock damage as well. In addition, the near-surface layers had to be modeled as being weak and compressible and as have a much lower sound speed than the material at depth. The is consistent with a fractured and jointed material at depth, and a weathered material near the surface.

27261 (LA-UR-93-1699) **Experimental and theoretical studies of spectral alteration in ultrasonic waves resulting from nonlinear elastic response in rock.** Johnson, P.A.; McCall, K.R.; Meegan, G.D. Jr. Los Alamos National Lab., NM (United States). 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930397-3: Numerical modeling for underground nuclear test monitoring symposium, Durango, CO (United States), 23-25 Mar 1993). Order Number DE93014432. Source: OSTI; NTIS; GPO Dep.

Experiments in rock show a large nonlinear elastic wave response, far greater than that of gases, liquids and most other solids. The large response is attributed to structural defects in rock including microcracks and grain boundaries. In the earth, a large nonlinear response may be responsible for significant spectral alteration at amplitudes and distances currently considered to be well within the linear elastic regime.

[1993]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930511-156: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014917. Source: OSTI; NTIS; GPO Dep.

Grumman Aerospace Corporation, Argonne National Laboratory, and Culham Laboratory are commissioning the Continuous Wave Deuterium Demonstrator (CWDD) in a facility at Argonne National Laboratory. CWDD is a high-brightness, high-current, 7.5-MeV negative deuterium accelerator. The 352-MHz rf accelerating cavities are cryogenically cooled with supercritical neon to reduce the rf power requirements. Installation of the accelerator into the Argonne facility began in May 1991, and first beam from the injector was extracted in February 1992. The accelerator and facility are described, and current status and future plans are discussed.

27263 (LA-12442-MS) **Active defenses: Status and issues.** Canavan, G.H. Los Alamos National Lab., NM (United States). Mar 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93013597. Source: OSTI; NTIS; GPO Dep.

Active defenses should logically be an integral part of future US force structures. In the near term they can defend US expeditionary forces, friends, and Allies. In the mid-term they will address accidental and unauthorized launch threats that already exist due to the missile forces of the Former Soviet Union/Republics and those evolving from the possession of missiles and weapons of mass destruction (WMD) by third-world countries. In the long term they could support the integration of strategic offensive and defensive forces to address the more deliberate attacks that might evolve on that time scale. Throughout, they could support measures to dealert and disengage strategic forces and help monitor their results.

27264 (UCRL-JC-110273) **Spacecraft fabrication and test integration: Leveraging existing information.** Sanders, D. (Lawrence Livermore National Lab., CA (United States)); Storch, N.; Sharick, T.; LeClair, S. Lawrence Livermore National Lab., CA (United States). Apr 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9204112-3: 2. small satellite technology and applications, Orlando, FL (United States), 20-24 Apr 1992). Order Number DE93012483. Source: OSTI; NTIS; GPO Dep.

The Automated Spacecraft Assembly Project (ASAP) or Manufacturing Operations Development and Integration Laboratories (MODIL) thrust is studying the potential for leveraging "soft" (computer-based) technologies in spacecraft manufacturing, because above-the-shop-floor costs typically account for 40 to 70% of the total costs of manufacturing. Our preliminary survey of soft technologies of above-the-shop-floor operations identified the areas which show the greatest potential benefit in cost and time savings for SDIO spacecraft fabrication and test. The preliminary survey reviewed initiatives from CALS, DARPA, ManTech, industry and SDIO. Three key areas with the greatest the potential benefits are: (1) enabling and re-engineering interactions between members of a conceptual "extended partnership organization" of System Program Office (SPO), prime contractors, sub-contractors and suppliers which produce an SDI system; (2) enabling computer supported inter-enterprise interactions; and (3) implementing integrated product development (IPD) programs for each SDI system. We propose initiatives to address all of these, including a roadmap to put high quality IPD in place in one SDI system, and then transfer the technology to all willing prime contractors and other SDI systems.

Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93014148. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy (DOE), with the US Army Chemical Research, Development and Engineering Center (CRDEC) under the sponsorship of the Defense Nuclear Agency (DNA), completed testing of Nondestructive Evaluation (NDE) technology on live agent systems. The tests were conducted at Tooele Army Depot during August 1992. The Nondestructive Evaluation systems were tested for potential use in verifying chemical treaty requirements. Five technologies, two neutron and three acoustic, were developed at DOE laboratories. Two systems from the United Kingdom (one neutron and one acoustic) were also included in the field trials. All systems tested showed the ability to distinguish among the VX, GB, and Mustard. Three of the systems (two acoustic and one neutron) were used by On-Site Inspection Agency (OSIA) personnel.

27266 (IEE-SR–238) **Environmental protection movements seen in American societies.: With educational and enlightening activities as main theme.** Institute of Energy Economics, Tokyo (Japan). 1 Mar 1993. 57p. (In Japanese). Order Number DE93798920. Source: OSTI; NTIS; Available from The Institute of Energy Economics, Dai 10 Mori Biru, 18-1, Toranomon 1-chome, Minato-ku, Tokyo, Japan.

This paper reports environmental protection movements seen in the American societies. The report consists mainly of a brief history of the American environmental protection movements and an on-site report on an environmental education summer camp. The environmental protection movements in the U.S.A. have been developing with the Nature Protection Movement (a non-governmental organization) as a base organization. The American environmental education has taken deep roots in people's life. Observing the nation's schooling systems, the social education systems, and the life styles leads to an awareness that such educational infrastructures are all well adjusted to promoting the environmental education. After outlining these American environmental education infrastructures, including a Japan-U.S. comparison, the present paper gives an on-site report of an environmental education summer camp. The National Wildlife Federation (NWF) holds summer camps intended mainly for environmental education and nature observation, where children are educated on environments while communing with nature. The American environmental protection movements with a history of more than 100 years are characterized by having taken roots in people's daily life since their childhood. 21 refs., 18 figs., 13 tabs.

27267 (NEI-DK–1222) **National Environmental Research Institute R and D projects 1993.** Danmarks Miljoeundersoegelser, Roskilde (Denmark). Apr 1993. 114 p.p. Order Number DE93500313. Source: OSTI; NTIS.

The publication provides detailed information on the current research activities of the National Environmental Research Institute (Denmark). NERI operates under the Danish Ministry of the Environment with the task of carrying out both strategic and applied research, and is responsible for the collection and the overall management and coordination of data on nature and the environment. The institute is also committed to providing the environmental authorities with extensive guidance and professional support. The scope of research is very broad, covering science, technology and also the social sciences. The institute firmly believes that environmental problems demand intensive interdisciplinary and trans-boundary research cooperation and invites comments on its line of research and offers of collaboration. Research areas of the described projects are divided under the headings of systems analysis, microbiology, ecotoxilogy, environmental and analytical chemistry, atmospheric research, arable land ecology, uncultivated areas and woodlands, lake-, estaurine-, marine- and population-ecology and environmental data management. Project descriptions include the names of the project coordinator and of the scientists involved in the research and the number of personnel involved during the year. Collaborating institutions are mentioned by name in addition to external sponsoring agencies and foundations. Descriptions are given of the project's objectives and the methods or line of action adopted for carrying out the research. The aims, structure and management of the National Environmental Institute are described. (AB).

Computing is an integral part of the research being conducted by scientists in the Molecular Sciences Research Center at Pacific Northwest Laboratory. The advanced computing infrastructure for the Computing and Information Sciences (C&IS) program of the Environmental and Molecular Sciences Laboratory will provide a state-of-the-art facility where scientific research can be performed to support US Department of Energy missions in environmental restoration and waste management, energy and environmental quality, and science and technology. The C&IS program is composed of five research and applied development facilities: High Performance Computing, Data Management and Archiving, Graphics and Visualization, Distributed Computing, Network Infrastructure, and Computer Instrumentation and Electronics. This report briefly describes the programs of these five facilities.

The Air Quality Utility Information System (AQUIS) was developed to calculate emissions and track them along with related information about sources, stacks, controls, and permits. The system runs on IBM- compatible personal computers with dBASE IV and tracks more than 1, 200 data items distributed among various source categories. AQUIS is currently operating at 11 US Air Force facilities, which have up to 1, 000 sources, and two headquarters. The system provides a flexible reporting capability that permits users who are unfamiliar with database structure to design and prepare reports containing user- specified information. In addition to the criteria pollutants, AQUIS calculates compound-specific emissions and allows users to enter their own emission estimates.

27270 (ANL/EAIS/TM–86) **Environmental assessment for the Atmospheric Radiation Measurement (ARM) Program: Southern Great Plains Cloud and Radiation Testbed (CART) site.** Policastro, A.J.; Pfingston, J.M.; Maloney, D.M.; Wasmer, F.; Pentecost, E.D. Argonne National Lab., IL (United States). Environmental Assessment and Information Sciences Div. Mar 1992. 223p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (DOE/EA–0680). Order Number DE93009439. Source: OSTI; NTIS; INIS; GPO Dep.

The Atmospheric Radiation Measurement (ARM) Program is aimed at supplying improved predictive capability of climate change, particularly the prediction of cloud-climate feedback. The objective will be achieved by measuring the atmospheric radiation and physical and meteorological quantities that control solar radiation in the earth's atmosphere and using this information to test global climate and related models. The proposed action is to construct and operate a Cloud and Radiation Testbed (CART) research site in the southern Great Plains as part of the Department of Energy's Atmospheric Radiation Measurement Program whose objective is to develop an improved predictive capability of global climate change. The purpose of this CART research site in southern Kansas and northern Oklahoma would be to collect meteorological and other scientific information to better characterize the processes controlling radiation transfer on a global scale. Impacts which could result from this facility are described.

27271 (BNL–48499) **An assessment of acid fog.** Lipfert, F.W. Brookhaven National Lab., Upton, NY (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920556–1: International symposium on measurement of toxic and related air pollutants, Durham, NC (United States), 4-8 May 1992). Order Number DE93009347. Source: OSTI; NTIS; INIS; GPO Dep.

Airborne particles have long been associated with adverse effects on public health, begin with the notorious air pollution disasters of several decades ago. Although H_2SO_4 was identified early

on as a potential causal factors during these episodes (in part because of concern for potential health effects of particle acidity per se has intensified only recently. Most of the recent aerometric research in the US on acid fog has focused on the ability of clouds and fog to deliver acidity to vegetation and ecosystems. Strong acids are characterized chemically by their pH or H^+ concentration. For fog, concentrations are referred to the droplet liquid content; for other (i.e., "clear air") aerosols, to the volume of air sampled. A useful measure of the relationship between aerosol and fog is obtained by comparing their mass concentrations on the basis of the same volume of air, by multiplying fogwater concentrations by liquid water content (LWC). This paper reviews fog measurement capability, physical properties and chemistry, and presents a simple urban airshed model which is used to simulate the evolution of fog and aerosol concentrations under urban stagnation conditions.

27272 (BNL–48755) **New York MARKAL: An evaluation of carbon dioxide emission control strategies in New York State.** Hamilton, L.D. Brookhaven National Lab., Upton, NY (United States). [1992]. 11p. Sponsored by Environmental Protection Agency, Washington, DC (United States); Empire State Electric Energy Research Corp., New York, NY (United States); New York State Energy Research and Development Authority, Albany, NY (United States). DOE Contract AC02-76CH00016. (CONF-9201150–1: International CHALLENGE symposium, Laxenburg (Austria), 30-31 Jan 1992). Order Number DE93013149. Source: OSTI; NTIS; INIS; GPO Dep.

A MARKAL model was developed for the State of New York. It represents the State's energy system as a set of typical technologies for generating, converting, and using energy as it evolves over a 45-year period. NYMARKAL was applied here in demonstration analyses to explore strategies to reduce CO2 emissions. NYMARKAL was installed at the State Energy Office and in the Offices of the New York Power Pool. Example scenarios showed that it is more difficult and more expensive to reduce carbon emissions in New York State than in the United States as a whole. Were a common carbon tax instituted, it would have less effect in New York and most carbon emissions reduction would take place elsewhere in the country where it is more cost-effective. Alternatively, were all states required to reduce CO2 emission an equal percentage (say by 20%), the cost per unit emissions reduction to New York would be much greater than in the rest of the country.

The traveler participated in the World Meteorological Organization (WMO) Meeting of Experts on the Role of Cloud Chemistry in Transformation and Transport of Air Pollutants. The purpose of the Workshop was to define research needs to improve description of cloud processes influencing atmospheric transport and transformation of pollutants, specifically including energy related pollutants. Traveler was co-chair of the microscale processes working group. A draft report was prepared; after editing, the report will be issued by WMO. The report identifies key research needs and suggests approaches, including acquisition of a greatly enhanced data base of measurements of cloud composition, development of a state-of-the-science community cloud chemistry model, and conduct of a series of international field experiments addressing clouds and cloud chemical processes. Traveler also visited the Institute of Experimental Meteorology at Obninsk, including its unique 3200 cubic meter cloud chamber and 330 meter meteorological tower.

27274 (BNL–70157) **Travel to England for meeting on Global Environmental Change: Foreign trip report, June 2, 1992–June 6, 1992.** Long, S.P. Brookhaven National Lab., Upton, NY (United States). 24 Jun 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93011059. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler participated in the UK Research Councils' meeting on support for Global Environmental Change. Specifically to evaluate grant applications under the AFRC Program on Biological Response to Global Environmental Change, to discuss a joint research councils feasibility study of elevated CO_2 experimental facilities (relevant to BNL's research on the effects of rising CO_2 concentrations on vegetation), to discuss the development of a UK initiative on the responses of ecosystems to rising UV-B irradiation, and to discuss integration with the NERC TIGER initiative.

27275 (BNL–70276) **[Greenhouse gases and national energy options]: Foreign travel trip report, October 24–November 4, 1992.** Hamilton, L.D.; Morris, S.C.; Goldstein, G.A. Brookhaven National Lab., Upton, NY (United States). 20 Nov 1992. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93008862. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of the trip was to attend and give essential presentations at the International Energy Agency (IEA), Energy Technology Systems Analysis Project (ETSAP) Annex IV, Greenhouse Gases and National Energy Options: Technologies and Costs for Reducing Emissions of Greenhouse Gases, 6th Workshop at ENEA, Rome, Italy (October 26-29, 1992) (LDH/SCM/GAG). In addition, Dr. L. D. Hamilton to act as US Department of Energy Representative at 6th Workshop and 6th Executive Committee Meeting of ETSAP Annex IV (October 30, 1992) (LDH/GAG) and to visit the Division of Envirorunental Health (WHO) HQ, Geneva, Switzerland (October 31 - November 3, 1992) (LDH). The travelers' role focused on the use of MARKAL and MARKAL-MACRO in analyses focussed on, strategies to reduce greenhouse gas emissions from energy systems.

27276 (CONF-9110336–, pp. 1-5) **A study of longwave radiation codes for climate studies: Validation with ARM observations and tests in general circulation models.** Ellingson, R.G. (Univ. of Maryland, College Park (US)); Baer, F. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

One specific goal of the Atmospheric Radiation Measurement Program (ARM) is to improve the treatment of radiative transfer in general circulation models (GCM) under clear-sky, general overcast, and broken cloud conditions. We plan to contribute to this goal by attacking major problems connected with one of the dominant radiation components of the problem-longwave radiation. In particular, our long-term research goals are to: develop an optimum longwave radiation model for use in GCMs that has been calibrated with state-of-the-art observations; assess the impact of the longwave radiative forcing in a GCM; determine the GCM's sensitivity to the radiative model used in it; and determine how the longwave radiative forcing contributes relatively when compared with shortwave radiative forcing, sensible heating, thermal advection, and expansion. Our approach to developing the radiation model will be to test existing models in an iterative, predictive fashion. We will supply the Clouds and Radiative Testbed (CART) with a set of models to be compared with operationally observed data. The differences we find will lead to the development of new models to be tested with new data. Similarly, our GCM studies will use existing GCMs to study the radiation sensitivity problem. We anticipate that the out come of this approach will provide both a better longwave radiative forcing algorithm and a better understanding of how longwave radiative forcing influences the equilibrium climate of the atmosphere.

27277 (CONF-9110336–, pp. 7-10) **Absorption coefficients of CFC-11, CFC-12, HCFC-22, and SF_6 relevant to atmospheric remote sensing and global warming studies.** Varanasi, P. (State Univ. of New York, Stony Brook (US)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States);

26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

Spectral absorption coefficients (or absorption cross-sections) K_v, ($cm^{-1}atm^{-1}$) of CFC-11, CFC-12, HCFC-12, and SF. have been measured in the spectral region (8-12 μm) known as the 'atmospheric window.' Data obtained with a grating spectrometer, which has wide spectral coverage and adequate spectral resolution (0.4 cm^{-1}), for CFC-11, CFC-12, and HCFC-12 are not presented here but can be obtained from the author. We have also measured at various temperature-pressure combinations, which are chosen to represent tangent heights (as in solar-occultation experiments) or layers in the atmosphere, the K_v of CFC-12 in the 921 and 923 cm^{-1} Q-branches, of HCFC-22 in the 829 cm^{-1} Q-branch, and of SF_6, in the 947.9 cm^{-1} Q-branch with the Doppler-limited spectral resolution ($\sim 10^{-4}$ CM^{-1}) of a tunable diode laser spectrometer. The latter is especially suited for atmospheric remote sensing, while the grating spectra are useful in global warming studies.

27278 (CONF-9110336–, pp. 11-13) **Spectroscopic study of water vapor absorption in the 8- to 14-μm atmospheric window: Measurement of new line and continuum parameters and investigation of far-wind phenomena.** Kulp, T.J. (Lawrence Livermore National Lab., CA (US)); Shinn, J. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

The accurate quantitative understanding of the latent infrared (IR) absorption in the atmospheric window regions continues to be an area of research interest for the global climate modeling community. This need is particularly great in the 8- to 14-μm window, which spans a large portion of the 300K blackbody emission spectrum. There, the latent absorption is caused primarily by water vapor and consists of two distinct features: (1) the weak lines originating both from transitions in the far edge of the water pure rotational band (at the long wavelength boundary of the window) and from transitions located in the trailing edge of the υ_2 rovibrational band (at the short wavelength boundary) and (2) the water vapor continuum. The data-base concerning the lines is periodically updated, yet there remain spectral gaps in which accurate laboratory measurements are required to substantiate long-path length atmospheric results. The continuum has been the subject of investigations for a number of years, both with respect to its spectral intensity as a function of temperature and pressure and with regard to its physical origins. At present, the continuum absorption near room temperature is relatively well characterized; however, the database must be expanded to span all relevant atmospheric conditions. Among the explanations proposed as causes of the continuum are the cumulative absorption of the far wings of distant lines, absorption by dimers and higher-order clusters, and higher-order linear absorption processes. A common thread among all these explanations is that the continuum absorption is somehow linked to intermolecular interactions between water molecules. The initial goals of this project are to address the gaps in the quantitative understanding of both the water vapor line and continuum in the 8- to 14-μm window. To this end, the initial year has been spent assembling the necessary equipment to make these measurements.

27279 (CONF-9110336–, pp. 15-20) **The HITRAN atmospheric molecular spectroscopic database.** Rothman, L.S. (Air Force Geophysics Lab., Hanscom AFB, MA (US)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

The Optical Environment Division of the Air Force Geophysics Laboratory has been engaged throughout its history in the development of computer codes and databases to facilitate spectral modeling of atmospheric transmission and radiative processes. Major updates to the computer codes have recently been made available: FASCODE3 (for high resolution line-byline calculations), LOWTRAN7 (moderate resolution band-model code), and MODTRAN (an intermediate resolution band-model code). In addition, a new edition of HITRAN, the spectroscopic molecular absorption database, has become available. HITRAN now contains greatly improved data for 30 molecular species from zero wavenumber through the visible region. There are also numerous bands of species such as the chlorofluorocarbons contained as cross-section data on the HITRAN compilation. These models and database have a significant impact on spectral simulations and remote sensing capabilities. This paper will review these recent developments and present some examples of current applications.

27280 (CONF-9110336–, pp. 21-24) **Radiative transfer model development in support of the Atmospheric Radiation Measurement (ARM) program.** Clough, S.A. (Atmospheric and Environmental Research, Inc., Cambridge, MA (US)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

The availability of a rapid highly accurate multiple scattering radiative transfer model is essential to meet the objectives of the Atmospheric Radiation Measurement (ARM) Program. The model must be capable of computing radiance at spectral intervals consistent with the monochromatic spectral variation of the atmospheric molecular absorption. The resolution of the spectrometers to be deployed at the ARM sites, 0.1 cm^{-1} and less, will provide an important assessment of our capability to perform radiative transfer calculations in the multiply scattered environment. A second important application for the high-accuracy high-resolution model is to provide parameterizations and validations for the faster low-resolution models required for general circulation models (GCMs). The computational cost of performing multiple scattering calculations at monochromatic resolution over broad spectral regions is extremely high. The major focus of our research effort has been directed to the development of an accelerated multiple scattering model for the longwave spectral region.

27281 (CONF-9110336–, pp. 25-27) **Treatment of cloud radiative effects in general circulation models.** Wang, W.C. (State Univ. of New York, Albany (US)); Liang, X.Z.; Dudek, M.D.; Cox, S. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

We participate in the Atmospheric Radiation Measurement (ARM) program with two objectives: (1) to improve the general circulation model (GCM) cloud/radiation treatment with focus on cloud overlapping and the cloud optical properties and (2) to study the effects of cloud/radiation-climate interaction on climate simulations. The project includes three tasks: (1) GCM radiation model-to-observation comparison, (2) GCM radiation model development, and (3) GCM climate simulations.

27282 (CONF-9110336–, pp. 29-32) **Analysis of cloud radiative forcing and feedback in a climate general circulation model.** Lacis, A. (NASA, Goddard Space Flight Center, New York, NY (US)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

The overall objectives of the Atmospheric Radiation Measurement (ARM) program research at the Goddard Institute for Space Studies (GISS) are to refine and validate the GISS General Circulation Model (GCM) radiation code through model intercomparisons

and comparison with ARM observations, to refine and restructure the GISS GCM diagnostics to facilitate more informative comparisons with global radiation/cloud datasets, and to use ARM data to develop improved parameterizations of the radiative impact of clouds and to study the interaction of dynamics and radiation.

27283 (CONF-9110336–, pp. 33-34) **Atmospheric radiation measurement aerosol working group.** Penner, J.E. (Lawrence Livermore National Lab., CA (US)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

The stated goal of the Atmospheric Radiation Measurement (ARM) program is to improve the treatment of radiation in general circulation models (GCMs). The means for doing so will be to compare model-predicted radiative fluxes with measured fluxes at four to six permanent sites. The measured fluxes will characterize the fluxes expected on the scale of a GCM grid box. Because aerosol optical depths at solar wavelengths vary from less than 0.01 under clean oceanic conditions to about 0.5 under hazy east coast conditions, the measured fluxes will, at the very least, need to be corrected for the altered flux characteristics due to aerosols. If the anthropogenic component of aerosols is changing with time and if the anthropogenic component of aerosol optical depths is significant (as suggested in several recent papers), general circulation models must also be improved to account for these effects. Furthermore, if aerosols also affect cloud optical depths (the Twomey effect), it becomes even more important to improve the treatment of aerosols and aerosol interactions with clouds in general circulation models. The question that faces ARM program management, however, is how best to approach these needs. What recommended set of research questions can the ARM program address, given the experimental framework of instruments and science objectives? What are the recommended approaches (experimental and modeling) for addressing these research questions?

27284 (CONF-9110336–, pp. 35) **Plane-parallel albedo bias.** Cahalan, R.F. (NASA, Goddard Space Flight Center, Greenbelt, MD (US)); Wiscombe, W.J. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

An increase in the average albedo of the Earth-atmosphere system of only 10% is potentially capable of decreasing surface temperatures below those of the last Ice Age. Nevertheless, cloud albedo biases of 10% and more would be introduced into large regions of current climate models if clouds were given their observed liquid water amounts, because of the treatment of clouds as plane-parallel. Past work has focused on the 3-D shape of clouds and its contribution to this bias. The present work ignores the shape effect and focuses instead on the effect of cloud optical depth variability within a climate model grid square. The plane-parallel approximation used in climate models such as general circulation models performs a single 1-D radiative transfer calculation for an entire grid square (consisting of many pixels), using a single pixel-averaged optical depth. In other words, the statistical variation of the optical depth within the grid square is ignored. We have found from Monte Carlo calculations that stratocumulus cloud albedo can often be treated in the "independent-pixel approximation," whereby, for radiative purposes, each cloud pixel is treated as 1-D. Basically, this finding means that inter-pixel variations in optical properties are often mild enough that whatever inter-pixel communication exists is, statistically speaking, nearly neutral (it is exactly neutral in a pure plane-parallel cloud). Unlike the plane-parallel approximation, the independent-pixel approximation considers the statistical variations of the optical depth within the grid square, but ignores imbalances in inter-pixel photon exchange.

27285 (CONF-9110336–, pp. 37-38) **A stochastic formulation of radiative transfer in clouds and radiative properties of non-uniform clouds.** Stephens, G.L. (Colorado State Univ., Ft. Collins (US)); Gabriel, P.D. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

The research conducted as part of these projects breaks down into three broad areas: Radiative transfer involving study of the radiative transfer in 2/3 dimensions as well as the issue of stochastic transfer. Radiative transfer parameterization for use in general circulation models (GCMs) and other climate models. Remote sensing focusing on using our radiative transfer knowledge to address key issues concerning the remote sensing of clouds. In this regard, we focus on new ways of remotely sensing cirrus ice water content. A list of publications in various stages of progress is provided at the end of this paper.

27286 (CONF-9110336–, pp. 39-40) **The effects of cloud heterogeneity on radiant fluxes at the top and bottom of the atmosphere.** Lovejoy, S. (McGill Univ., Montreal, Quebec (CA)); Davis, A.; Tessier, Y.; Schertzer, D.; Borde, R.; Frouin, R.; Gautier, C.; Lavallee, D. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

The radiative transfer community is increasingly understanding the crucial role of horizontal cloud heterogeneity in determining the albedos and transmittance properties of clouds. At the same time, the potentially large implications for general circulation model (GCM) parameterizations have not been widely recognized. This project involves a collaboration by four different institutions (UCSB, Scripps, McGill, Meteorologic Nationale), and aims at understanding, modelling, and theoretically and empirically quantifying the heterogeneity. Relating the heterogeneity of the clouds to that of the radiation fields necessarily involves models of cloud intermittency. In the last ten years, great strides in turbulence, chaos, and fractals have enormously broadened the scope of scaling (scale invariant) notions, making such models natural candidates for radiative transfer studies.

27287 (CONF-9110336–, pp. 41-42) **Radiative effects of non-uniform clouds.** Daum, P. (Brookhaven National Lab., Upton, NY (US)); Kleinman, L.; Stephens, G. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

The overall objective of the Atmospheric Radiation Measurement (ARM) Science Project 'Radiative Effects of Non-Uniform Clouds" is to improve the treatment of cloud radiation interactions and feedbacks in general circulation models (GCMs) by obtaining a better understanding of the distribution of water in the atmosphere and its relation to the radiation reflected and emitted by clouds. Subobjectives are to test current model parameterizations of short and long wave cloud radiation interactions and to determine the climatological relations between domain average radiative properties and cloud structure. This abstract summarizes an experimental strategy to achieve these objectives, focusing on the measurements likely to be available from the first Cloud and Radiation Testbed (CART) site. An organizing concept that is useful in classifying the individual experiments is a distinction between experiments that are primarily mechanistic or primarily climatological. The emphasis in a mechanistic experiment is to identify morphologically simple cloud systems and assembles of sufficient observations to mechanistically link cloud and radiative properties. This category of experiments is primarily directed at the testing of cloud-radiation parameterizations. In the climatological category of experiments, the emphasis is on accumulating a long-term record

of radiometric, cloud, and meteorological variables, and thereby determining relations between cloud and radiation climatology.

27288 (CONF-9110336–, pp. 43-45) **Interactions between deep convection and upper tropospheric cloudiness.** Randall, D.A. (Colorado State Univ., Fort Collins (US)); Xu, K. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

The role of clouds has been identified as a key uncertainty in studies of global climate change (e.g., Cess et al. 1990). Among the most important clouds for climate are the cirrus, cirrostratus, and 'anvil" clouds found in the upper troposphere. These clouds are often produced by the detrainment outflow from deep cumulus convection. They absorb much of the infrared radiation upwelling from below and re-emit it at much lower temperatures, thus producing a strong net radiative warming in the infrared part of the spectrum. Their tendency to cool the Earth by increasing its albedo is also important, but infrared warming typically dominates. In support of the Atmospheric Radiation Measurement (ARM) program, we are developing an improved parameterization of upper tropospheric cloudiness, with emphasis on cloud formation, maintenance, and destruction (as opposed to cloud optical effects) by; following, in parallel, a physically based approach based on the use of prognostic liquid/ice and variables, and an approach similar to that outlined by Randall (1989), together with an improved parameterization of moist convection; conducting preliminary tests of the new parameterizations in a one-dimensional version of the Colorado State University (CSU) general circulation model (GCM), including tests in which the one-dimensional model is "forced' with observations collected at ARM sites; using the UCLA cumulus ensemble model (CEM) to perform further tests of the parameterization, in part by simulating observations collected during ARM, and to suggest model-development strategies; performing climate simulations with the full three-dimensional version of the CSU GCM; and making the improved parameterizations available and adaptable for use in other models, through use of suitable design strategies and also through ARM's Cloud and Radiation Testbed (CART).

27289 (CONF-9110336–, pp. 47-49) **Parameterization tests for the Atmospheric Radiation Measurement Program.** Iacobellis, S.F. (Univ. of California, San Diego (US)); Somerville, R.C.J. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

Until Atmospheric Radiation Measurement (ARM) data become available, we are using our single-column model as a testbed to improve and validate parameterizations. As an example of this research, we describe a set of numerical experiments undertaken to compare the results of two cumulus convection parameterizations. The two parameterizations are the Kuo-Anthes scheme (Kuo 1974; Anthes 1977) and the Arakawa and Schubert scheme with and without downdrafts included (Arakawa and Schubert 1974; Kao and Ogura 1987; Ogura and Kao 1987). The model is a one-dimensional diagnostic model (Iacobellis and Somerville 1991a, 1991b) resembling a single column of a general circulation model. The model includes vertical atmospheric transports by convection and turbulent mixing, radiative transfer including interactive clouds, and a surface energy balance coupled to an ocean mixed-layer model. At each time step, observational analyses are used to supply the model with the horizontal advection of heat and moisture. Output from the model includes time series of sea surface temperature, oceanic mixed-layer depth, atmospheric temperature and humidity profiles, precipitation and surface energy budget components. The initial version of this model, which incorporated the cumulus parameterization of Kuo-Anthes, was used in a diagnostic study of the onset of the Indian summer monsoon (Iacobellis and Somerville 1991a, 1991b). In that study the model was run for four weeks beginning about three weeks before the onset of the monsoon. A comparison of the results against independent observational data indicated that the column model is capable of simulating the evolution of the heat and moisture budgets prior to and during the monsoon onset. For the present study, the Arakawa-Schubert (AS) cumulus parameterization has been incorporated. Thus the model can be run with either the Kuo or the AS parameterization.

27290 (CONF-9110336–, pp. 51-54) **Numerical simulations of an idealized convective system: Comparisons between parameterized and explicitly resolved clouds.** Kao, C.Y.J. (Los Alamos National Lab., NM (US)); Bossert, J.E. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

One of the objectives of the US Department of Energy's Atmospheric Radiation Measurement (ARM) program is to improve the parameterization of clouds in general circulation models (GCMs). The approach we take in the current research is to examine the behavior of cumulus parameterization schemes by comparing their performance in mesoscale simulations with the results from explicit cloud simulations. Kao and Ogura (1987) compared the 'semi-prognostic" results by the Arakawa-Schubert (A-S) cumulus parameterization scheme with results produced by a cloud ensemble model (CEM) developed by Tao (1983). This earlier study builds the foundation for the present investigation which includes a major refinement. That is, the performance of the A-S scheme is examined in a fully prognostic fashion, and the results are compared with those derived from a fully time-dependent cloud model (i.e., not a CEM which is normally forced by a prescribed time-independent large-scale lifting process), under identical atmospheric conditions. We believe this approach is superior to the one in Kao and Ogura (1987) associated with the semi-prognostic simulations that cannot simulate the feedback processes between the cloud and large-scale fields. We shall call the simulation with the A-S scheme the parameterization case and the one by a detailed cloud model the microphysics case. Note that the only difference between the two cases is that cloud effects are parameterized in the former with a coarser resolution; whereas, each cloud is explicitly resolved by the latter with a much finer resolution. The capability of the A-S scheme in reproducing the growth and life cycle of a cloud system can then be evaluated. The numerical model we have recently acquired from Colorado State University, Regional Atmospheric Modeling System (CSU-RAMS) (Cotton et al. 1988), is used in this research.

27291 (CONF-9110336–, pp. 55-62) **Development of a regional-scale climate model with a detailed microphysics parameterization.** Bossert, J.E. (Los Alamos National Lab., NM (US)); Kao, C.Y.J.; Winterkamp, J.L.; Roads, J.O.; Chen, S.C. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

Over the past two decades the meteorological community has witnessed the evolution of general circulation models (GCMs) from studies attempting to simulate realistic large-scale dynamical regimes and energy transports, to present investigations examining future climate change scenarios. This evolution is certain to continue over the next decade, since the GCM community, through the US Department of Energy's Atmospheric Radiation Measurement (ARM) and Computer Hardware, Advanced Mathematics and Model Physics (CHAMMP) programs, has been challenged with producing realistic scenarios for future climate change down to regional-scales (~50 km). Unfortunately, the development of high-resolution GCMs is at least 5 to 10 years away, while the need for information on potential climate change impacts over specific regions is immediate. The regional climate issue can be dealt with in several ways. One approach has been to use existing coarse-scale GCM

out put to focus in on particular regions (Gutowski et al. 1991; Grotch and MacCracken 1991). However, the mismatch in scale between the GCM and the processes driving the regional climate limit the representativeness of these studies. A more realistic alternative is to implement a model with a finer resolution mesh over the region of interest within a GCM. For example, a limited area (i.e., mesoscale) model could be initialized with, and forced on the boundaries by, GCM output or other large-scale data sets, over an extended period. Studies have shown that mesoscale models can provide a regional climatology that is of sufficient detail to be useful for global change assessments, provided that the model's performance can be adequately validated with existing data.

The Computer Hardware, Advanced Mathematics, and Model Physics (CHAMMP) program is a relatively new component of the Global Change Research Program sponsored by the Environmental Sciences Division (ESD) of the US Department of Energy (DOE). Dr. David Bader leads the program, assisted by Dr. Robert Malone and myself. CHAMMP is an integral part of the ESD climate modeling program and its objectives are highly complementary to the modeling activities being conducted as part of DOE's Program for Climate Model Diagnosis and Inter comparison. CHAMMP is also closely linked to the US Global Change Research Program, especially through its interactions with the major climate modeling centers of the other agencies. Because of its need for and focus on use of forefront supercomputers,CHAMMP is also a contributing program in the High Performance Computing and Communications Program, which is a new Presidential Initiative dedicated to the 'grand challenge' computational problems. Just as the Atmospheric Radiation Measurement (ARM) program was formed in recognition of the inability of current general circulation models (GCMS) to satisfactory represent cloud formation, convection, and radiative processes, the CHAMMP program was organized in response to the need to harness greater computational power in the pursuit of regionally resolved projections of climate change. For a number of reasons, current GCMs simply are not adequate for making accurate projections of future climate. The types of problems for which models must be developed and tested include coupled ocean-atmosphere simulations with 50- to 100-km resolution and extending centuries in duration, simulations that represent the evolution of atmospheric composition from 1750 out to 2100, simulations of the evolution of global ecosystems and biogeochemical cycles, and studies of paleoclimatic changes.

27293 (CONF-9110336–, pp. 67-68) **Data assimilation and the Atmospheric Radiation Measurement Program.** Louis, J.F. (Atmospheric and Environment Research, Inc., Cambridge, MA (US)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

This paper is a brief introduction to data analysis and assimilation concepts; its purpose is to define the role of data assimilation in the Atmospheric Radiation Measurement (ARM) program. It may be useful to start with a very short, and probably oversimplified, historical perspective on the treatment of data in meteorology and, more specifically, in weather prediction. The original concept of data analysis was a way of establishing a picture of a meteorological field on the basis of more or less randomly distributed observations. Long before the advent of computers, meteorologists were routinely contouring fields by hand, using synoptic observations. To a large extent, this was an art as much as a science, but it allowed the development of techniques, some mathematical and some purely graphical, to predict the evolution of the fields. From very early on, it was recognized that data should not necessarily be taken at face value and that drawing to the data was not necessarily the best way to go. Already in the days of hand analyses, conceptual models were used. With the development of computers, a lot of effort was devoted to trying to automate the process of hand analysis of meteorological data. Curve fitting and statistical interpolation were the two main directions followed. At the same time as the concept of data assimilation was developed (in the sixties), new sources of data, mainly from satellites, were becoming available. The concept of optimal interpolation was then developed. It is only a short step from optimal interpolation to the principle of variational assimilation which is currently under development. In the context of ARM, it is clear that the role of data assimilation will be mainly to provide a continuous, internally consistent picture of the atmospheric state over the Cloud and Radiation Testbed (CART) site, in order to provide appropriate initial conditions and verification data for models and parameterization experiments.

27294 (CONF-9110336–, pp. 69-72) **Testbed model and single column data assimilation for the Atmospheric Radiation Measurement Program.** Louis, J.F. (Atmospheric and Environment Research, Inc., Cambridge, MA (US)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. Atmospheric and Environment Research's (AER) project for the Atmospheric Radiation Measurement (ARM) project is to further develop and test a model originally designed for local weather prediction. This model will be used for three distinct but related purposes: (1) to provide a single column model testbed that simulates a global climate model, in order to facilitate the development and testing of new cloud parameterizations and radiation models; (2) to assimilate the ARM data continuously at the scale of a climate model, using the adjoint method, thus providing the initial conditions and verification data for testing parameterizations in single column model studies; (3) to study the sensitivity of a radiation scheme to cloud parameters, again using the adjoint method, thus demonstrating the usefulness of the testbed model. In the first couple of years of the contract we will concentrate on developing the data assimilation system. Two of the big problems with using the ARM data will be its scale representativity (or lack thereof) and its incompleteness. Data assimilation is one way to address both problems. Data assimilation can be described as a way to generate a complete and continuous picture of the atmospheric profile above the Cloud and Radiation Testbed (CART) site. A model is used to define the characteristic scale of the solution, to provide time continuity, and to ensure dynamical balance of the fields. The model also provides an estimate of atmospheric quantities that are not directly measured. To the extent that the model is a reasonable representation of the atmosphere, these computed quantities are, at least, consistent with the observations.

27295 (CONF-9110336–, pp. 73-76) **An integrated cloud observation and modeling investigation in support of the Atmospheric Radiation Measurement Program.** Ackerman, T. (Pennsylvania State Univ., University Park (US)); Albrecht, B.; Lamb, D.; Seaman, N.; Thomson, D.; Warner, T. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. Although the cloud observation and modeling investigation is an integrated project, it subdivides into three components. The first centers on the operations of the Cloud Observing System (COS). This includes instrument development, data acquisition, data analysis, and algorithm development. A large part of our activities in this first year have focused on this particular component. The second focuses on physically-based process models designed to simulate cloud and radiation interactions. During the first year, the activity in

this area has been largely developmental. The third component centers on the mesoscale modeling. The focus of this work is on model development and testing, particularly in the area of cloud properties. Again, this work has been largely developmental in the first year. The natural flow of the project is from the observational database to the process model simulations to the incorporation of cloud parameterizations into the mesoscale model. Our intent is to use the process models, in conjunction with the observations, to expand our understanding of cloud formation and maintenance and interactions with the radiation budget. The model studies, observations, and new insights will form the basis on which improved and new parameterizations will be developed and incorporated into the mesoscale model.

27296 (CONF-9110336–, pp. 77-80) **An integrated data assimilation and sounding system.** Dabberdt, W.F. (National Center for Atmospheric Research, Boulder, CO (US)); Martin, C.; Cole, H.L.; Dudhia, J.; Horst, T.; Kuo, Y.H.; Oncley, S.; Baelen, J. van; Gage, K.S.; Ecklund, W.; Carter, D.; Strauch, R.; Westwater, E.R.; Revercomb, H.; Smith, W.L.USDOE Office of Energy Research, Washington, DC (United States). The Integrated Data Assimilation and Sounding System (IDASS) provides high-resolution tropospheric structure through the use of atmospheric measurements and a dynamic mesoscale model. The measurement system (Integrated Sounding System, or ISS) is developed around a suite of in situ and active and passive remote sensors which individually satisfy certain needs, but which together function in a complementary mode. ISS subsystems may include: multiple-frequency UHF wind profiler(s) with a_ radio acoustic sounding system (RASS); a Navaid-based sounding system; a surface meteorological station; a microwave profiler (MWR); a high-resolution infrared sounder; and a laser ceilometer. The ISS operates as an integrated system. Important aspects of the system are the synergistic interaction of data streams from the individual instruments and the application of real-time and post facto data assimilation, as well as the mechanical integration that provides a central data acquisition, processing, display and communications capability in the field for re- search studies. Measurements from the in situ and remote sensing instruments are coupled with a state-of-the-art mesoscale modeling system. In the mesoscale data assimilation process, the model solution is relaxed toward the available observations so that it is consistent with the measurements. Over regions where there are no observations, the evolution of the model fields is constrained by model dynamics and physics. The end product is a highly resolved four-dimensional meteorological dataset (including three components of wind, temperature, humidity, cloud water, and integrated moisture). The mesoscale data assimilation scheme is the Newtonian nudging technique. During the data assimilation period, observations of wind, temperature, and humidity are used to nudge (or relax) the time dependent model variables to the observed values.

27297 (CONF-9110336–, pp. 81-82) **A field evaluation of NOAA remote sensor measurements of wind, temperature, and moisture.** Martner, B.E. (National Oceanic and Atmospheric Administration, Boulder, CO (US)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. The Atmospheric Radiation Measurement (ARM) program goals are ambitious, and its schedule is demanding. Many of the instruments, proposed for operations at the first Cloud and Radiation Testbed (CART) site as early as 1992 represent emerging technology and exist only as special research prototypes. Therefore, an important preparatory step for ARM was an intensive field project in Colorado in 1991 to assess the suitability of instruments and techniques for profiling the thermodynamic and kinematic structure of the troposphere and lower stratosphere. The field work was designed to provide ARM with a head start by gathering practical information for the design and operation of the CART sites. Additional longer term research, also fundamental to ARM goals, will use the 1991 data to design an optimized combination of diverse profiling instruments. The data will also be used to extrapolate single site data to dynamically consistent, four-dimensional fields at general circulation model (GCM) subgrid scales using a data assimilation mesoscale model. The result will be an integrated system for atmospheric profiling tailored to ARM's needs. This ARM Science Team research is being conducted by a partnership that includes the National Center for Atmospheric Research (NCAR), the National Oceanic and Atmospheric Administration (NOAA) the Wave Propagation Laboratory (WPL), the Aeronomy Laboratory, and the University of Wisconsin. NOAA has also conducted shorter range infrastructure research for ARM/CART in which the performance of the NOAA remote sensors used in the 1991 field project was examined. Recommendations for CART instrumentation were derived from these evaluations and from the experience that NOAA scientists and engineers have obtained by designing and operating these instruments over the years. This research is reported in a NOAA Technical Memorandum by Manner et al. (1991).

27298 (CONF-9110336–, pp. 83-85) **The boardman ARM regional flux experiment.** Doran, J.C. (Pacific Northwest Lab., Richland, WA (US)). Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

In June 1991, a field campaign was conducted to study the effects of sub-grid scale variability of surface sensible and latent heat fluxes on surface boundary layer properties and to provide data with which to address the problem of extrapolating from a limited number of local measurements to obtain areal-averaged values of fluxes appropriate for use in general circulation models (GCMs). Participants in the campaign included DOE's Argonne National Laboratory, Los Alamos National Laboratory, Pacific Northwest Laboratory, the National Oceanic and Atmospheric Administration's Atmospheric Turbulence and Diffusion Division, and several other collaborators. We sought an experimental site in which surface fluxes of sensible and latent heat could be expected to differ sharply from one surface to another (with each surface of order 10 km in length) but would show relatively minor variations over any particular surface. With such a site, we hoped to see a clear signature of the effects of surface inhomogeneities, test one or more parametric schemes relating turbulent fluxes to vertical gradients of mean quantities, evaluate methods of measuring surface fluxes over inhomogeneous terrain, examine the variation of surface fluxes over a range of scales, and establish procedures for extrapolating flux values from smaller scales to larger ones.

27299 (CONF-9110336–, pp. 87-92) **Measurements of surface heat flux over contrasting surfaces.** Coulter, R.L. (Argonne National Lab., IL (US)); Shannon, J.D.; Martin, T.J. In a multilaboratory field study held near Boardman in northeastern Oregon in June 1991 and described in greater detail elsewhere (Doran et al. 1991), various properties of the surface and lower atmospheric boundary layer over heavily irrigated cropland and adjacent desert steppe were investigated. The locale was selected because its disparate characteristics over various spatial scales stress the ability of general circulation models (GCMS) to describe lower boundary conditions, particularly across the discontinuity between desert (in which turbulent flux of heat must be primarily as sensible heat) and large irrigated tracts (in which turbulent flux of latent heat should be the larger term).

The lower boundary of the GCM (general circulation model) modeling domain, the earth's surface, exerts a strong influence on regional dynamics of heat and water vapor, and the heterogeneity in the surface features can be responsible for generating regional mesoscale circulation patterns. Changes in the surface vegetation due to anthropogenic activity can cause substantial changes in the ratio of sensible to latent heat flux and result in climate changes that may be irreversible. A broad variety of models for representing energy fluxes are in use, from individual leaf and canopy models to mesoscale atmospheric models and GCMS. Scaling-up a model is likely to result in significant errors, since biophysical responses often have nonlinear dependence on the abiotic environment. Thus, accurate and defensible methods for selecting measurement scales and modeling strategies are needed in the effort to improve GCMS. There are few data sets that detail the fluxes, soil and vegetative characteristics, and topographic and landscape features over broad spatial and regional scales. Yet if we are to arrive at a functional average of the soil and vegetation properties over a GCM grid cell, such datasets of interrelating variables must be obtained in order to determine the appropriate scale for the measurements of these features at other sites and to estimate inherent variability and uncertainty in measurements made at different scales. Finally, to avoid the errors that are inherent in transferring across scales, a formulation of processes across a grid cell requires simplifications in modeling at larger scales that must be validated from detailed 'bottom-up" mechanistic studies and bounded by sensitivity tests. To address some of these issues in scaling and averaging of measurements, a collaborative field campaign was conducted in June 1991 by the DOE laboratories funded under the ARM program.

27301 (CONF-9110336–, pp. 99-102) **Parameterization of convective clouds, mesoscale convective systems, and convective-generated clouds.** Cotton, W.R. (Colorado State Univ., Fort Collins (US)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

This presentation is a summary of research progress supported under the Atmospheric Radiation Measurement (ARM) project entitled 'Parameterization of Convective Clouds, Mesoscale Convective Systems, and Convective-Generated Clouds.' The approach used in this research is to perform explicit simulations of convective clouds and mesoscale convective systems for well-documented observed cases. The simulated data are used to help us in fabricating, calibrating, and testing parameterization schemes of these cloud systems. The approach is analogous to the large-eddy-simulation (LES) approach that has been quite successfully used in developing parameterizations of turbulent transport in the convective boundary layer. The work builds on research by Weissbluth (1991) who developed parameterizations of deep convective clouds updrafts and downdrafts.

27302 (CONF-9110336–, pp. 103-109) **Multi-spectral automated rotating shadowband radiometry.** Harrison, L. (State Univ. of New York, Albany (US)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

Two related instruments are being developed for use in the Atmospheric Radiation Measurement (ARM) program; both use an automated rotating shadow band technique to make spectrally resolved measurements of the direct-normal, total horizontal, and diffuse horizontal irradiances. These parameters of the sky-radiance function are measured using the same detector (for a given wavelength), eliminating the difficulties inherent in comparing these data when measured by independent detectors. The first of these instruments uses independent interference-filter/photodiode detectors to measure any seven wavelength bands chosen between 350 nm and 2.5 μm. Nine of these multiple filter instruments are currently deployed as part of the US Department of Energy's (DOE) Quantitative Links measurement program. This instrument has been selected for deployment in the spring of 1992 at the extended field sites of the first Cloud and Radiation Testbed (CART) installation. The second instrument uses a prism spectrograph and a Charge-Coupled Device (CCD) photodiode array to measure 256 wavelength intervals from 370 nm to 1 μm. This instrument, which is at the prototype stage, is intended for deployment at the central sites. In this abstract, the technical features of these two instruments and data recovery and interpretation for sky conditions in which single-scattering dominates are described.

27303 (CONF-9110336–, pp. 111-114) **New shortwave solar radiometer with information-based sparse sampling.** Simpson, M.L. (Oak Ridge National Lab., TN (US)); Carnal, C.L.; Ericson, M.N.; Falter, D.D.; Falter, K.G.; Jellison, G.E. Jr.; Kryter, R.C.; Maddox, S.R.; Munro, J.K.; Rochelle, J.M.; Spratlin, T.L. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. DOE Contract AC05-84OR21400. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

A new concept for a real-time shortwave solar radiometer is presented, based on the premise that high resolution measurements of the shortwave solar spectrum are needed only in wavelength regions where the atmospheric physics are changing rapidly with respect to 1. The design features holographic optical elements (HOES) for nonuniform sampling of the spectrum, customized photocells, and temperature-compensated monolithic wide dynamic range amplifiers. Preliminary results show full spectrum reconstruction accuracies to $< 3\%$ with a 10:1 reduction in the number of photocells required.

27304 (CONF-9110336–, pp. 115-119) **The Radiation Measurement System (RAMS).** Valero, F.P.J. (NASA, Ames Research Center, Moffett Field, CA (US)); Pilewskie, P. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

Radiative processes in the atmosphere are at the heart of anthropogenically induced climatic changes. High quality measurements of radiative parameters must be obtained to be able to characterize the way in which the interaction of radiation with the atmosphere results in climatic change and evolution. With the goal of contributing to the above objective we are developing state-of-the-art radiation measuring instruments. We are using the latest technology and extensive heritage from our aircraft and spacecraft systems to achieve the stringent requirements of the Atmospheric Radiation Measurement (ARM) program. The Radiation Measurement System (RAMS) will provide infrared spectral and broadband fluxes and radiances. Furthermore, the RAMS will be an integrated system with central instruments control, real time data processing and display, and the modeling capacity to monitor the progress of the experiments. We also plan to offer, for consideration by the science team, prototype field demonstrations of novel solar multichannel instrumentation (the solar instrumentation is being minimally funded by other sources). The combination of self consistent, infrared (IR) and shortwave radiometers is, in our opinion, crucial to meet the ARM requirements.

27305 (CONF-9110336–, pp. 121-124) **High spectral resolution fourier transform infrared (FTIR) instruments for the Atmospheric Radiation Measurement Program: Focus on the atmospheric emitted radiance interferometer.** Revercomb, H.E. (Univ. of Wisconsin, Madison (US)); Best, F.A.; Dedecker, R.G.; Dirkx, T.P.; Herbsleb, R.A.; Knuteson, R.O.; Short, J.F.; Smith, W.L. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

Ground-based Fourier Transform infrared (FTIR) instruments are being produced at the University of Wisconsin (UW) and the University of Denver (UD) for the Atmospheric Radiation Measurement (ARM) Program's Cloud and Radiation Testbed (CART) sites as part of a joint Instrument Development Program (IDP). The three instrument types underdevelopment are summarized. For each ARM site, the 1 cm^{-1} resolution Atmospheric Emitted Radiance Interferometer (AERI) is expected to be operated both at the central site and at four extended boundary locations to allow its use for radiometric studies and for remote sensing of horizontal inhomogeneities. The AERI is being built by the UW and is the primary subject of this report. The extra high resolution AERI-X and the ultra high resolution Solar Radiance Transmission Interferometer (SORTI) are planned for the central sites and are described in more detail in a separate abstract by the UD.

27306 (CONF-9110336–, pp. 125-126) **Tethered balloon sounding system for vertical radiation profiles.** Whiteman, C.D. (Pacific Northwest Lab., Richland, WA (US)); Alzheimer, J.M.; Anderson, G.A.; Garnich, M.R.; Shaw, W.J. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

A small, tethered balloon sounding system is being developed to make broadband radiometric and meteorological profiles through the lowest 1500 m of the atmosphere. The major technical issue of this instrument development project is the construction of a stable platform that will keep the complement of radiometric instruments level, regardless of balloon motion. A prototype stable platform, called the Sky Platform, has now been completed and is being demonstrated in the poster session of the science team meeting. The Sky Platform is an equilateral triangle approximately 65 cm on a side and formed from aluminum tubing. A mount for radiometric and horizontal sensors is supported inside the triangle, and the Sky Platform is carried on the tetherline 30 m or more below a small, helium-filled, tethered balloon. At a point 30 m below the balloon, the main tetherline branches into a 3-m-long section of three lines, only to rejoin the main tetherline at the end of the 3-m section. The Sky Platform is carried within the 3-m-long section. One corner of the Sky Platform is attached to one of the lines at the center of the 3-m-long section, while the remaining corners of the Sky Platform are attached to the remaining two lines through pulleys driven by small electric motors. The platform is kept level by an automatic control loop which interrogates the horizontal sensors (accelerometers) on the Sky Platform and drives the motors and pulleys to keep the Sky Platform level. A flux gate magnetometer provides platform heading information.

27307 (CONF-9110336–, pp. 127-129) **Cloud and aerosol characterization for the ARM central facility: Multiple remote sensor techniques development.** Sassen, K. (Univ. of Utah, Salt Lake City (US)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. Our research program to establish how active and passive remote sensing information can best be applied to the problem of characterizing the cloudy atmosphere has two basic components. The first task, which we have nearly completed, is the fabrication of a state-of-the-art dual-wavelength Polarization Diversity Lidar (PDL) system to thoroughly evaluate the various lidar polarization techniques for cloud and aerosol research. As recently reviewed in Sassen (1991), the basic two-channel method for measuring linear depolarization has been highly effective as a cloud microphysical research tool. Through the use of linear depolarization ratios, water and ice particle clouds can be unambiguously discriminated, and a number of ice particle types and orientations can be identified. (These capabilities should improve as geometrical optics ray-tracing theory is applied to predicting ice crystal habit depolarization ratios.) Nonetheless, there is still much to be explored in the polarization lidar field, including the information contents of additional backscatter polarization (i.e., four-channel Stokes) parameters, simultaneous multiple-wavelength and multiple-polarization state (including circular) laser probing, and the variable receiver field-of-view (FOV) technique for studying multiple scattering depolarization and particle size inversion.

27308 (CONF-9110336–, pp. 131-134) **Laser remote sensing of water: Raman lidar development.** Goldsmith, J.E.M. (Sandia National Labs., Livermore, CA (US)); Lapp, M.; Bisson, S.E.; Melfi, S.H.; Whiteman, D.N.; Ferrare, R.A. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

We outline here our research program to develop an optimized critical design for a Raman lidar system for measuring daytime profiles of atmospheric water vapor. The Raman lidar technique is a leading candidate for providing the high-resolution, day-night profiling of water vapor that is critical to programs in global climate change research. Because of the crucial role that water vapor plays directly in the earth's radiation budget as an absorber, as well as its role in cloud formation and optical phenomenology, accurate, three-dimensional measurements of water-vapor concentration are an essential part of the experimental capability that we anticipate will be required for climate-change research. Raman lidar is currently used to perform meteorologically important, sustained, reliable nighttime profiling of water vapor; typical configurations yield random uncertainties of less than $\pm 10\%$ out to ranges of 7 km in 2-minute integration periods with range resolution on the order of 100 m (Melfi and Whiteman 1985; Melfi et al. 1989; Whiteman et al., in press). Daytime measurements are much more difficult because of the difficulties inherent in detecting the weak Raman signal against solar backgrounds. Demonstrations to date have been limited to ranges on the order of 1 km (Petri et al. 1982; Renaut et al. 1980; Renaut and Capitini 1988). This paper will describe our development of a solar-blind Raman lidar capable of extended-range daytime profiling of atmospheric water vapor. The first part of the paper will describe the principle of solar-blind operation and discuss the computer model being developed to guide optimization of the instrument configuration. The second part of the paper will focus on an overview of the laboratory research being performed to support the model and instrument development. Finally, we will describe our participation in SPECTRE (Spectral Radiance Experiment), a major field experiment held during the fall of 1991.

27309 (CONF-9110336–, pp. 135-136) **Development of a cloud profiling radar system.** McIntosh, R.E. (Univ. of Massachusetts, Amherst (US)); Pazmany, A.; Sekelsky, S.; Mead, J. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

In this presentation we summarize our achievements during the past year in developing a Cloud Profiling Radar System (CPRS). This system will eventually operate simultaneously at both 35 and

95 GHz. It will be coherent (to measure Doppler frequency shifts owing to cloud particle motions) and fully polarimetric. Although much of our activity has been concerned with the engineering of the 35- and 95-GHz radar systems and an integrated antenna system, we also have had the opportunity to conduct preliminary field experiments with the University of Wyoming at Elk Mountain, Wyoming. These experiments were also supported by the National Science Foundation in order to determine the depolarizing characteristics of cloud ice particles.

27310 (CONF-9110336–, pp. 137-140) **Status of instrumentation for the southern Great Plains clouds and radiation testbed.** Wesely, M.L. (Argonne National Lab., IL (US)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

Planning for the initial complement of instrumentation at the first Cloud and Radiation Testbed (CART) site has concentrated on obtaining a sufficient level of instrumentation at the central facility for studies of radiative transfer processes in a narrow column above the site. The auxiliary facilities, whose sole purpose is cloud mapping above the central facility, will not be activated as such until provisions are made for all-sky imaging systems. In the meantime, the auxiliary facilities will be instrumented as extended facilities if the locations are suitable, which would be the case if they serve the primary purpose of the extended facilities, i.e., obtaining representative measurements of surface energy exchanges, state variables, precipitation, soil and vegetative conditions, and other factors that must be considered in terms of boundary conditions by single-column and related models. The National Oceanic and Atmospheric Administration (NOAA) radar wind profiler network is being considered to provide observations of vertical profiles at the boundaries of the CART site. If possible, these locations will be used for boundary facilities. Efforts are proceeding to gain access to the wind profiler network data and to determine if a sufficient number of the profilers can be equipped as Radio Acoustic Sounding Systems (RASS). Profiles of temperature as well as winds are needed at the boundary facilities for studies with single-column models and four-dimensional data assimilation models. Balloon-borne sounding systems will be used there initially for both temperature and moisture profiles. Infrared spectrometers will eventually be used to infer moisture profiles at these boundary facilities.

27311 (CONF-9110336–, pp. 141-143) **Vision statement for research and educational outreach for the ARM CART southern Great Plains locale.** Lamb, P.J.; Crawford, K.C.; Brock, F.V.; Rabin, R.M. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

Our proposal capitalized on and reflected the considerable collective expertise in the atmospheric sciences (both research and educational) that resides in the 'Weather Center" assemblage of organizations on the University of Oklahoma (OU) campus. This 'Weather Center' has the following components: OU School of Meteorology (SOM); OU-NSF Center for Analysis and Prediction of Storms (CAPS); OU-National Oceanic and Atmospheric Administration (NOAA) Cooperative Institute for Mesoscale Meteorological Studies (CIMMS); Oklahoma Climatological Survey (OCS); NOAA/ Environmental Research Laboratories (EARL) National Severe Storms Laboratory (NSSL); Operational Support Facility for the Weather Surveillance Radar - 88 Doppler Program of the National Weather Service (OSF WSR-88D); National Weather Service Forecast Office (NWSFO). All of these 'Weather Center' entities will make vital contributions to the program of research and education outreach proposed for the Southern Great Plains locale for the Atmospheric Radiation Measurement (ARM) program's Cloud and Radiation Testbed (CART). The research component of the program is guided by the overall goal of the ARM program to improve the treatment of cloud radiative forcing and feedbacks in general circulation models (GCMs) and to improve the empirical characterization of the cloud and radiative processes in the Earth's atmosphere and the parameterization of the processes in atmospheric models. The goal of educational outreach will be to use a multi-disciplinary approach that combines meteorology, climatology, computer graphics, telecommunications, geography, geology, and agriculture in a series of applied environmental projects designed to educate a new generation of precollege and college students about our environment, its impact on our society, and the consequences of a changed climate in the 21st century.

27312 (CONF-9110336–, pp. 145-150) **Tropical western Pacific project: Status.** Clements, W. (Los Alamos National Lab., NM (US)); Ackerman, T.; Renne, D. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

The Atmospheric Radiation Measurement (ARM) Program's Tropical Western Pacific (TWP) locale will be the location of the second of five primary Cloud and Radiation Testbed (CART) sites. The locale lies in the tropical warm pool region roughly between 100 S to 100 N of the equator and from 1300 E to the dateline. Phased implementation is scheduled to begin in late 1993. The main activity of the TWP project in the next year is to define the particular science to be conducted and to select an appropriate site or sites to make the required measurements. The science questions of interest to ARM fall under 5 general headings: (1) Cloud-radiation interactions, (2) Vertical transports of mass and energy, (3) Air-sea interaction, (4) Initiation of convection, and (5) The coupling of the tropics to the mid-latitude. These headings are broad and collectively span a tremedous diversity of atmospheric and oceanic processes. It is uncertain whether all of these areas can be addressed using data collected at the TWP CART site. Thus, one of the high priorities over the next year will be to define science issues and prioritize the issues with regard to data collection and use of ARM resources.

27313 (CONF-9110336–, pp. 151-153) **The north slope of Alaska: The Atmospheric Radiation Measurement Program's window on high latitude phenomena.** Zak, B.D. (Sandia National Labs., Albuquerque, NM (US)); Stamnes, K. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

A major thrust of the Atmospheric Radiation Measurement (ARM) Program is the establishment of five primary and four supplementary Cloud and Radiation Testbed (CART) sites. The CART sites will provide the means to acquire the necessary data to test and further develop the components of general circulation models (GCMs), which describe the relationships between the characteristics of the atmosphere and the solar and thermal radiation which passes through it. The CART Locale Recommendation Team has presented a priority-ordered set of recommended locales for the primary and supplementary sites, along with alternatives for each (Schwartz et al. 1991). The selection was based primarily on the following criteria: geographical and climatological homogeneity occurrence of climatologically important cloud types; seasonal change of surface properties variability of radiatively active atmospheric components synergism with other programs; and manageable logistics. An additional criterion was that, taken together, the set of recommended locales must span a broad range of climate regimes. The recommended primary locales include two land and three ocean locales. The first CART site will be established in the Southern Great Plains (SGP) of the United States. The next CART site to be established on land is to be in the polar regions, on the North Slope of Alaska (NSA).

27314 (CONF-9110336–, pp. 155-160) **Gulf stream locale - a field laboratory for cloud process.** Raman, S. (North Carolina

State Univ., Raleigh (US)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Dec 1992. From 2. Atmospheric Radiation Measurement (ARM) science team meeting; Denver, CO (United States); 26-30 Oct 1991. In *Proceedings of the second Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 169p. Order Number DE93005886. Source: OSTI; NTIS; INIS.

The Guld Stream Locale is covered by clouds over 70% of the time. These clouds mainly consist of cumulus, stratocumulus, altostratus, and and alto-cumulus. Clouds associated with the Gulf Stream Locale are in general due to the cyclogenesis or redevelopments of the storms off the east coast of the United States in winters, movement along the coast of the storms that are generated over the Gulf of Mexico in the spring and fall and mesoscale convective circulations present in all seasons. During the summer and early fall this region is also susceptible to hurricanes moving from the south. The challenge is to devise a method to realistically incorporate the thermodynamic processes associated with these clouds in dynamic climate models. That would require a better understanding of the physical processes of clouds of different scales produced by different processes. The Gulf Stream Locale provides a test case for these processes since a finer resolution global climate model can resolve some of the predominant cloud features in this region. The Gulf Stream, responsible for the generation of the clouds, cannot be resolved explicitly in these models. One of the main ARM scientific issues to be addressed in this locale is the process of cloud formation, maintenance, and dissipation. It is important to parameterize the cloud processes properly so that the correct type of clouds with appropriate radiative properties are generated in a climate model. Parameterization is necessary because the processes responsible for the generation of clouds are micro and mesoscale. Other ARM scientific issues of relevance are surface turbulent fluxes of sensible and latent heat, surface inhomogeneity (in roughness, hydrology and heating), diurnal variations in surface energy budget, and the representations of the planetary boundary layer in large scale models.

27315 (CONF-930285–1) **Forest management for fixing and sequestering carbon.** Marland, G.; Dale, V.; Graham, R.; Luxmoore, R.; Marland, S.; McLaughlin, S.; Norby, R.; Post, W.M.; Tschaplinski, T.; Tuskan, J.; Wright, L. Oak Ridge National Lab., TN (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 2. US/Japan workshop on global change research: environmental response technologies; Honolulu, HI (United States); 1-3 Feb 1993. Order Number DE93013520. Source: OSTI; NTIS; INIS; GPO Dep.

The concept of planting trees as part of a strategy to confront the possibility of global climate change is now widely accepted. As trees grow they remove CO_2 from the atmosphere and thus slow the atmospheric build-up of CO_2, an important greenhouse gas. Within the global-climate-change context, there are two fundamental problems with managing trees to store carbon. First, the magnitude of fossil-fuel related emissions of CO_2 is so large, 6 billion metric tons of carbon per year that it takes very large areas of tree planting to make a significant impact. Second, as trees mature their rate of growth, and hence rate of net carbon uptake, declines. lie large demand on land area suggests that there is a limit to the fraction of total CO_2 emissions that we might reasonably expect to offset with growing trees. The ultimate maturation of forests suggests that there is a limit on the length of time over which offsets are feasible and that we need to ask what to do as the rate of C uptake declines. Acknowledging a that the availability of land will constrain the ability of tree planting to offset industrial emissions of CO_2, we consider how the land which is available can be used most effectively. This report speculates on how much land might be available for a forest management strategy motivated (at least partially) by concerns about climate change, but our principal focus is on how a given land area can be best used to minimize net emissions of CO_2 and how much might be achieved on a unit of land. We do not suggest that carbon management should be the principal criteria for land management, but we discuss the implications if it were. Confronting global and local changes in climate will be one of many objectives in land management and we explore for the most effective strategy for pursuing this objective.

27316 (DOE/ER/60970–T1) **Monitoring the response of the upper troposphere/lower stratosphere to a greenhouse gas scenario: Final progress report, May 1, 1990–December 15, 1992.** Davis, J.M.; Cox, S.K. Colorado State Univ., Fort Collins, CO (United States). Dept. of Atmospheric Science. 15 Dec 1992. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER60970. Order Number DE93014509. Source: OSTI; NTIS; INIS; GPO Dep.

During the past two years a system has been under development to contribute to this monitoring process by making measurement of the downwelling infrared radiance field at moderate spectral resolution. Sensitivity of the measurements to the presence of cirrus cloudiness, and effective particle size in cirrus clouds has been demonstrated. Sensitivity of the measurements to concentration of $C0_2$ and to the gross temperature structure of a $2CO_2$ atmosphere have been modeled, and measurements have been made at various locations to provide a data base for further system evaluation. A temperature retrieval algorithm has been acquired and examined concerning its potential for monitoring temperature and gaseous concentration profiles. A continue research program is described herein that may be divided into three parts. First, continued system development must be pursued. This includes continued attention to the absolute accuracy of the measurements, and implementation of the Path Characterization Algorithm (retrieval code). Second, the value of long term deployment of the system at a site of considerable elevation is necessary. Third, inclusion of a solar transmission capability at moderate resolution is proposed.

27317 (DOE/ER/61012–T3) **Linkage of anthropogenic aerosol to clouds and climate: Progress report No. 3.** Hudson, J.G. Nevada Univ., Reno, NV (United States). Desert Research Inst. 14 Dec 1992. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG08-90ER61012. Order Number DE93016434. Source: OSTI; NTIS; INIS; GPO Dep.

During the first year of this project equipment was built to obtain direct droplet measurement data from a mobile platform in fog (or mountain impacted stratum) and to characterize CCN according to particle volatility (thermal processing). Since the start date, July 15, 1990, was during the California stratus season and it was necessary to complete the construction of equipment and allow time before a field project it was not possible to begin field work until the summer of 1991. This report discusses surface measurements made in 1991 and 1992 as well as the SEAHUNT (Shiptrail Evolution Above High Updraft Naval Targets) Project and the ASTEX (Atlantic Stratocumulus Transition Experiment) Project.

27318 (DOE/ER/61014–3) **The role of clouds and oceans in global greenhouse warming: Part 1, Progress report.** Hoffert, M.I. New York Univ., NY (United States). Dept. of Applied Science. Dec 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER61014. Order Number DE93016206. Source: OSTI; NTIS; INIS; GPO Dep.

During the past three years we have conducted several studies using models and a combination of satellite data, in situ meteorological and oceanic data, and paleoclimate reconstructions, under the DoE program, "Quantifying the Link Between Change in Radiative Balance and Atmospheric Temperature". Our goals were to investigate effects of global cloudiness variations on global climate and their implications for cloud feedback and continue development and application of NYU transient climate/ocean models, with emphasis on coupled effects of greenhouse warming and feedbacks by both the clouds and oceans. Our original research plan emphasized the use of cloud, surface temperature and ocean data sets interpreted by focused climate/ocean models to develop a cloud radiative forcing scenario for the past 100 years and to assess the transient climate response; to narrow key uncertainties in the system; and to identify those aspects of the climate system most likely to be affected by greenhouse warming over short, medium and long time scales.

27319 (DOE/ER/61056–T1) **The Department of Energy's Atmospheric Chemistry Program: A critical review.** National Academy of Sciences - National Research Council, Washington, DC (United States). 1991. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-90ER61056. Order Number DE93015312. Source: OSTI; NTIS; INIS; GPO Dep.

In response to a request from the Department of Energy's (DOE) Office of Health and Environmental Research (OHER), the Committee on Atmospheric Chemistry has reviewed OHER's Atmospheric Chemistry Program (ACP). This report contains the committee's evaluation and critique arising from that review. The review process included a two-day symposium held at the National Academy of Sciences on September 25 and 26, 1990, that focused on presenting the ACP's current components, recent scientific accomplishments, and scientific plans. Following the symposium, committee members met in a one-day executive session to formulate and outline this report. In undertaking this review, OHER and ACP management requested that the committee attempt to answer several specific questions involving the program's technical capability and productivity, its leadership and organization, and its future direction. These questions are given in the Appendix. This report represents the committee's response to the questions posed in the Appendix. Chapter I explores the committee's view of the role that atmospheric chemistry could and should assume within the DOE and its prospective National Energy Strategy. Chapter 2 assesses the current ACP, Chapter 3 presents recommendations for revising and strengthening it, and Chapter 4 restates the committee's conclusions and recommendations.

27320 (DOE/ER/61474–1) **[An experimental regional scale climate simulation laboratory]: Year 1 progress letter.** Wisconsin Univ., Madison, WI (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER61474. Order Number DE93015935. Source: OSTI; NTIS; GPO Dep.

The major focus of this CHAMMP science team project is the development and in-model testing of new numerical methods and dynamical algorithms which are particularly well suited to massively parallel computers. The project includes efforts relevant to both global ocean circulation models and atmospheric General Circulation Models GCMS. During the first year of the project we have been focusing on two basic areas. The first of these is the implementation and testing of a global non-linear dynamics code using the Local Spectral (LS) formalism. During the first year of the CHAMMP project we have been focusing on developing an efficient parallel implementation of a spherical LS code on a massively parallel computer. Our initial implementation platform has been the Thinking Machines CM5 system. We have completed an initial implementation of the LS system on the CM5 using a semi-spectral partitioning where the convolution sums in the LS kernel are computed using direct convolutions in the meridional direction and FFT based fast convolutions are performed using the Winnograd method in the zonal direction. A second element of the first year effort has been the evaluation of alternate dynamical systems for use in global ocean circulation models. In this area we have concentrated our efforts on parabolic non-hydrostatic systems using artificial compressibility.

27321 (DOE/FTR–93011423) **[A trip to Krakow, Poland to investigate their clean fossil fuels and energy efficiency program]: Foreign trip report, November 6–15, 1992.** Gyorke, D.F.; Mundorf, W.; Lebetz, D.; Russial, T. USDOE Pittsburgh Energy Technology Center, PA (United States). 4 Dec 1992. 15p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93011423. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Douglas Gyorke (US DOE/PETC; 412/892-6173), William Mundorf (US DOE/PETC; 412/892-4483), Donna Lebetz (US DOE/PETC; 412/892-6206), and Thomas Russial (US DOE/PETC; 412/892-4630) visited Krakow, Poland, on November 6–15, 1992. The purpose of this visit was to conduct a pre-proposal conference for Program Opportunity Notice (PON), DE-PN22-92PC92178, and to participate in the seminars for US and Polish firms arranged by the Bilateral Steering Committee (BSC) for the Krakow Clean Fossil Fuels and Energy Efficiency Program. The Program addresses approximately 1,350 small boiler houses and 125,000 home heating stoves in Krakow that have been identified as being significant sources of atmospheric pollution, and includes five subprojects that represent various approaches to pollution reduction. If subprojects demonstrate commercial viability relative to a free market in Poland, they could lead to the formation of various Polish/American joint ventures to supply equipment or fuels to reduce gaseous and particulate emissions in the Krakow area. The five designated subprojects are: 1. District Heating 2. Replacement by Natural Gas 3. Electric Heating 4. Boiler Houses 5. House Stoves. The Program is being conducted in three phases: I. Data gathering; II. Communication of information on the Program to interested US companies; and III. Solicitation for US companies to form businesses in Poland to supply equipment and/or services to reduce emissions in the Krakow area.

27322 (DOE/FTR–93012978) **Travel to France and Germany to present a paper and attend IAU/ICSU/UNESCO exposition on the adverse environmental impacts on astronomy and attend workshop at IFU/FhG: Foreign trip report, June 26–July 12, 1992.** Laulainen, N.S. Pacific Northwest Lab., Richland, WA (United States). 7 Aug 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012978. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The objective of the IAU/ICSU/UNESCO Exposition in Paris was to inform government officials, professional and amateur astronomers, and science writers of the increasingly serious adverse impacts of environmental conditions on the science of astronomy and to draft a declaration (attached) on the reduction of these environmental impacts for urging action by UNESCO and ICSU. The traveler's role at the meeting was to present a paper on atmospheric light extinction and to get information on the availability of measurements of light extinction obtained by astronomers. The Fraunhofer Institute in Garmisch (IFU) has a central role in defining, planning, and conducting environmental and climate research programs for the German Federal Ministry of Science and Technology and the Ministry of Environment. The traveler's role at the workshop on aircraft measurements to study temporal changes in the concentration and deposition of atmospheric pollutants was to assist in defining appropriate aircraft measurements. I also presented a seminar on atmospheric light extinction and promoted collaborative work.

27323 (DOE/FTR–93013121) **[Travel to Austria for a conference on visibility and fine particles]: Foreign trip report, September 13–20, 1992.** Laulainen, N.S. Pacific Northwest Lab., Richland, WA (United States). 13 Oct 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93013121. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The objective of the Conference on Visibility and Fine Particles in Vienna was to bring together internationally renown visibility and aerosol scientists to deal with all aspects of atmospheric aerosol particles, including their interaction with light, degradation of visual air quality, their origin and the processes leading to their formation in the atmosphere, and the effectiveness of air pollution strategies on the improvement of visual air quality. Several sessions were particularly relevant to the DOE Visibility Assessment work, including those on aerosol formation and relative humidity response, the relative contributions of aerosol light scattering and light absorption to visibility impairment, the characterization of natural/non-energy background aerosols and visibility impairment, and perceptibility of visual air quality changes.

27324 (DOE/ID–10432) **Air emission inventory for the Idaho National Engineering Laboratory: Final report.** Allen, P.H. EG and G Idaho, Inc., Idaho Falls, ID (United States). Mar 1991. 504p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (INEL/MISC–93065). Order Number DE93013749. Source: OSTI; NTIS; GPO Dep.

During the fall of 1989, an Air Emission Inventory was initiated at the Idaho National Engineering Laboratory (INEL). This inventory was undertaken in part at the request of the State of Idaho Air Quality Bureau (IAQB) so that the emission of air contaminants from the INEL could be quantified and this information used when future air permits are evaluated. The INEL would also benefit by: enabling preparation of an application for a site-wide permit to operate, facilitating preparation of other air permits, and allowing the INEL management to track and receive credit for facilities that are being phased out. The air contaminants that are included in this inventory are the Criteria Pollutants (Nitrogen Oxides, Sulfur Oxides, Carbon Monoxide, Volatile Organic Compounds, Lead, and PM10),

and Radionuclides. For this inventory, all particulate (TSP) is considered to be PM10, but will be differentiated in the Toxic Air Pollutant inventory that INEL will prepare over the next year. It is important to note that many of the terms used in this document are not used as defined in the regulations for the control of air pollution. Terms such as major, minor, and significant with regards to emissions are used as relational terms to the inventory, rather than descriptive of regulatory concepts. When this information is used for permitting purposes, these terms will be reserved for their regulatory meanings.

27325 (DOE/ID–10433) **Air Emission Inventory for the Idaho National Engineering Laboratory: 1990 and 1991 emissions report.** Stirrup, T.S. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jun 1992. 599p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (INEL/MISC–93066). Order Number DE93013730. Source: OSTI; NTIS; GPO Dep.

During the fall of 1989, the Air Emission Inventory (AEI) was initiated at the Idaho National Engineering Laboratory (INEL). This inventory was undertaken in part at the request of the State of Idaho Air Quality Bureau (IAQB). The request was to provide a mechanism so the emission of air contaminants from the INEL could be quantified and this information used when future air permits are evaluated. The pollutants associated with the inventory include nitrogen oxides, sulfur oxides, carbon monoxide, volatile organic compounds, lead, and particulates as well as radionuclides. For the inventory, all particulate (TSP) is considered to be PM10, but will be differentiated in the INEL Toxic Air Pollutant Inventory which DOE-ID is presently preparing for submittal to the State. For the purposes of this report, only the criteria pollutants and radionuclides are reported; any noncriteria pollutants will be addressed as required.

27326 (EGG–11265-4001) **The Atmospheric Release Advisory Capability Site Workstation System.** Foster, K.T. (Lawrence Livermore National Lab., CA (United States)); Sumikawa, D.A.; Foster, C.S.; Baskett, R.L. Lawrence Livermore National Lab., CA (United States); EG and G Energy Measurements, Inc., Pleasanton, CA (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-93NV11265 ;W-7405-ENG-48. (CONF-930810–1: Topical meeting on environmental transport and dosimetry, Charleston, SC (United States), 31 Aug - 3 sep 1993). Order Number DE93011032. Source: OSTI; NTIS; INIS; GPO Dep.

The Atmospheric Release Advisory Capability (ARAC) is a centralized emergency response service that assesses the consequences that may result from an atmospheric release of toxic material. ARAC was developed by the Lawrence Livermore National Laboratory (LLNL) for the Departments of Energy (DOE) and Defense (DOD) and responds principally to radiological accidents. ARAC provides radiological health and safety guidance to decision makers in the form of computer-generated estimates of the effects of an actual, or potential release of radioactive material into the atmosphere. Upon receipt of the release scenario, the ARAC assessment staff extracts meteorological, topographic, and geographic data from resident world-wide databases for use in complex, three-dimensional transport and diffusion models. These dispersion models generate air concentration (or dose) and ground deposition contour plots showing estimates of the contamination patterns produced as the toxic material is carried by the prevailing winds. To facilitate the ARAC response to a release from specific DOE and DOD sites and to provide these sites with a local emergency response tool, a remote Site Workstation System (SWS) is being placed at various ARAC-supported facilities across the country.. This SWS replaces the existing antiquated ARAC Site System now installed at many of these sites. The new system gives users access to complex atmospheric dispersion models that may be run either by the ARAC staff at LLNL, or (in a later phase of the system) by site personnel using the computational resources of the SWS. Supporting this primary function are a variety of SWS-resident supplemental capabilities that include meteorological data acquisition, manipulation of release-specific databases, computer-based communications, and the use of a simpler Gaussian trajectory puff model that is based on Environmental Protection Agency's INPUFF code.

27327 (ENEA-RT-AMB–91-11) **Global climate change modelling.** Vialetto, G. ENEA, Casaccia (Italy). Area Energia Ambiente e Salute. Apr 1991. 51p. (In Italian). (RT/AMB–91-11). Order Number DE93799202. Source: OSTI; NTIS (US Sales Only).

Concern for the increasing concentrations of carbon dioxide and other greenhouse gases in the atmosphere is at the root of the flourishing of studies and research aimed at answering if this phenomenon is actually able to cause global climate changes. Many studies are based on models that are able to simulate the climate system and to produce predictions of future climatic trends. This paper describes a methodology for studying climate and global changes based on the use of a climate model. A classification of models that have been used is also proposed. This paper briefly reviews how these models are being used and the kind of experiments that have been developed in the latter studies. Particular attention is given to the studies representing the current trend of the research in climate change modelling.

27328 (ENEA-RT-AMB–91-25) **Plycyclic aromatic hydrocarbon concentrations in urban air particulates: Sampling in 18 Italian cities.** Di Palo, C.; Chiavarini, S.; Zamora, P. ENEA, Casaccia (Italy). Area Energia Ambiente e Salute. Sep 1991. 24p. (In Italian). (RT/AMB–91-25). Order Number DE93799222. Source: OSTI; NTIS (US Sales Only).

Polycyclic Aromatic Hydrocarbons (PAHs), ubiquitous in the environment are emitted into the atmosphere (mainly from the incomplete combustion of fossil fuels) as adsorbates on dust particles and aerosols. Many PAHs have been shown to be potent carcinogens and mutagens in biological assays, and it is therefore not surprising that their concentration in the air is monitored in many cities throughout the world. In this work, the concentration of fourteen PAHs were measured in the respirable fraction (<10 microns of aerodynamic diameter) of the suspended particulate matter in eighteen Italian cities, during the 'Treno Verde' campaign. The samples, collected by high volume samplers, were extracted in a Soxhlet apparatus, cleaned and fractionated by silica gel column chromatography and analyzed by GC-MS operating in SIM (selected ion monitoring mode) and HPLC with spectrofluorimetric detection. In this paper, a tentative correlation of the analytical results is proposed with concentration data for particulate matter, NOx, hydrocarbons and CO. By means of the ratios of benzo(a)pyrene (B(a)P) to benzo(ghi)perylene and of pyrene to B(a)P, the possibility of establishing the source of the PAHs is indicated.

27329 (ENEA-RT-DISP–92-01) **TRIAS code for groundwater flow and solute transport calculations.** Paris, P. ENEA, Rome (Italy). Direzione Sicurezza Nazionale e Protezione Sanitaria. Jun 1992. 32p. (In Italian). (RT/DISP–92-01). Order Number DE93799245. Source: OSTI; NTIS (US Sales Only); INIS.

TRIAS is an analytical groundwater flow and solute transport mode that simulates saturated flow in a phreatic aquifer at steady-state conditions and solute transport in transient conditions for instantaneous and permanent sources and for hazardous waste landfill releases. TRIAS is specially useful in those situations where the scarsity of data does not allow for a more detailed characterization of the aquifer. For example, it may be used for the preliminary qualification of a waste disposal site, evaluating its capability to limit pollutant concentrations. TRIAS features a complete user interface with screen menus and on-line help facilities that provide comprehensive support to users. Graphic outputs are provided for both the groundwater head and concentration distributions.

27330 (ETDE/JP-mf–93798681, pp. 46-53) **Global air pollution and its preventive measures.** Ando, J. (Chuo University, Tokyo (Japan). Faculty of Science and Engineering). 20 Jan 1993. 94p. (In Japanese). In *Symposium on global environmental conservation and air pollution prevention technology.* Order Number DE93798681. Source: OSTI; NTIS (US Sales Only).

This paper explains the current situation of global air pollution and its preventive measures, using various tables and statistics. They may be summarized as follows: artificial generation of SO2 and NOx has been decreased in industrialized countries, and is

beginning to increase in developing countries; Germany uses more rigorous standards of NOx emission than Japan; Japan has stack gas desulfurization equipment next to the U.S.A. in capacity, but largest in number in the world; rains in the north and central parts of China have high pH, which leaves concerns in Japan about its future effects; acid rain has caused acidification of lakes remarkably in North Europe and North America, but not in Japan and China; most of the stack gas desulfurization facilities uses limestone as an absorbent to produce gypsum in Japan and Europe, and disposable sludge in the U.S.A.; Taiwan has adopted the magnesia process; a cost comparison indicates that combustion improvements or in-furnace denitrification is inexpensive for reducing NOx emission, but denitrification is expensive; and using coals applied with sufficient pollution control measures is less expensive than using oil. 18 figs., 13 tabs.

27331 (ETDE/JP-mf–93798681, pp. 89-94) **Current situation in CO2 membrane separation technologies.** Ninomiya, K. (Ube Industries, Ltd., Yamaguchi (Japan)). 20 Jan 1993. 94p. (In Japanese). In *Symposium on global environmental conservation and air pollution prevention technology.* Order Number DE93798681. Source: OSTI; NTIS (US Sales Only).

Expectations are given on membrane separation technologies as measures to solve environmental CO2 problems. This paper describes membrane performance required in recovering CO2 contained in combustion exhaust gases, and applicability of the technologies to actual scenes. Separation membranes are required of having fast permeation velocities and high separation rates α ratio of (permeation coefficients). Most of membranes being used practically (for H2-O2 separation) are organic membranes. Membranes with fast permeation velocity include polyallylene oxide membranes and aromatic polyimide membranes, but their separation rates are low. Generally they are in a trade-off relation. Module types may include flat membrane laminate, spiral, and hollow fiber systems, all requiring techniques to manufacture membranes with large area for treating a large amount of CO2. According to a trial calculation assuming the CO2 recovery rate of 60%, an attempt of recovering 95% CO2 requires nearly impossible separation rate α, but there would be a possibility if combined with liquefied coal recovery or if two-step membranes are used. 2 refs., 4 figs., 2 tabs.

27332 (INIS-mf–13543) **Conference on provisions against radon: Proceedings.** Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. [232p.] (In Czech, Slovak). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

The Proceedings contain 20 contributions dealing with diverse aspects of the radon problem. Information is presented on the occurrence of radon on the territory of Czechoslovakia, and on natural radioactivity of rocks. The majority of contributions concentrate on ways of radon measurement, on determination of the radon content of building materials and on radon propagation through buildings. Various technologies for removing radon from homes and for preventing radon leaks are described and assessed. The effect of radon on human health is also dealt with. (M.D.). 16 tabs., 34 figs., 39 refs.

27333 (INIS-mf–13543, pp. 1-5) **Radon risk maps - correct applications.** Barnet, I. (Ustredni Ustav Geologicky, Prague (Czech Republic)). Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

The Czech Republic has been surveyed for radon risk, and maps on the 1:200 000 scale have been set up based on results of field measurements of the volume activity of radon in soil air (4 800 measurements in total). The maps are used in territorial planning, in setting up strategies for financing remedial actions and in determining priorities for radon monitoring in buildings and in drinking water. The radon pathway from a rock is affected by soil permeability, tectonic defects and climatic factors. The radon risk assessment, however, cannot rely on regional maps solely; additional, more detailed measurements are necessary. (M.D.). 2 tabs., 3 refs.

27334 (INIS-mf–13543, pp. 23-31) **Radon monitoring in general.** Hulka, J. (Krajska Hygienicka Stanice, Hradec Kralove (Czech Republic). Oddeleni Hygieny Zareni). Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

The problems of radon measurement in buildings and rooms is dealt with in detail. The radon content of air varies in time, in dependence on the way of airing and on the difference between the indoor and outdoor temperatures. It also varies in space, which is determined by whether the radon source in the room is a point source and whether the ventilation is efficient. Values averaged over a long period of time or measurement of the radon input to the building must be applied to obtain unbiased data. Track detectors are used to perform the basic survey of existing buildings. Detailed radon diagnostics is aimed at finding particular radon sources. (M.D.). 2 figs.

27335 (INIS-mf–13543, pp. 71-78) **Evaluation of radon risk from the subsoil.** Kulajta, V. (Radium s.r.o., Liberec (Czechoslovakia)). Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

The principles of radon risk measurement and evaluation are given, as follow from health physics instructions and practical experience. The determination of the volume activity of ^{222}Rn in soil air at 0.6-0.8 m depths is the basic surveying method. The results are affected by the climatic conditions and by the sampling technology. A method of detailed radon survey of building plots is described. The radon risk categories for building areas combine the radon occurrence in the subsoil, volume activity of soil air and permeability of the soils and rocks to gases. (M.D.). 2 tabs., 5 refs.

27336 (INIS-mf–13543, pp. 79-85) **Radon propagation through buildings.** Dousa, P. (Institut Hygieny a Epidemiologie, Prague (Czech Republic)). Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

Mathematical formulas describing the diffusion of radon through building material layers, and the diffusion and flow of radon through cracks in the layers are given. Air flow, which is responsible for 97% indoor radon transfer, arises from temperature differences indoors and outdoors as well as between the rooms. In winter, when the homes are heated, the houses behave like stacks sucking in air from the subsoil. The kind of floor has a major effect on indoor radon activity. (M.D.). 3 figs., 1 tab., 2 refs.

27337 (INIS-mf–13543, pp. 86-94) **Radon survey in the Jihlava district.** Wasserbauer, S. (Okresni Hygienicka Stanice, Jihlava (Czechoslovakia)); Novotny, Z. Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

The radon activity in drinking water exceeds the maximum permissible value fivefold at many sites in the Jihlava district. The radon risk has been monitored there since 1991. Track detectors evaluating the annual exposure are installed in buildings. Work on a detailed study of the public health status is in progress. Design

documentation of new buildings to be constructed within the district must include results of soil radon measurement. (M.D.). 4 figs.

27338 (INIS-mf–13543, pp. 119-127) **Physics underlying the searching for radon sources in houses.** Thomas, J. (Institut Hygieny a Epidemiologie, Prague (Czech Republic)). Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

The radon diagnostics of houses is briefly outlined. The aim of radon diagnostics consists in the identification of radon sources (subsoil, building material, water), location of the main and side pathways of radon inlet in the building, quantification of the amounts of radon passing through the pathways and spreading through the house. The stack effect of radon suction from the subsoil into the building due to the temperature difference or underpressure caused by wind is described. The radon risk is different in the different seasons of the year and also varies throughout the day. Good diagnosis of radon transfer into a house requires a great deal of skill. (M.D.). 1 fig.

27339 (INIS-mf–13543, pp. 153-160) **Detailed survey of buildings as a targeted system of test procedures.** Breda, M. (Centrum Stavebniho Inzenyrstvi, Praha (Czechoslovakia)); Kilian, V. Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

Recommendations for radon measurements in buildings are given. The survey begins by interviewing the householder and studying the technical documentation. Relative determination of the gamma dose rate and of the amount of radon and examination of the air replacement patterns follow. Finally, TLD dosemeters and radon monitors are installed and building material samples are taken for analysis. (M.D.).

27340 (INIS-mf–13543, pp. 211-218) **Radon in the interior of building structures and the sick building syndrome.** Senitkova, I. (Stavebna Fakulta TU, Kosice (Czechoslovakia)); Dobiasova, N. Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Slovak). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

The resulting volume activity of radon in air in a room is determined by the rate of radon emanation and by the intensity of airing. The risk is aggravated by the tendency to seal windows in order to save heat, and to manufacture building materials from raw materials which contain elevated amounts of radionuclides. Track detectors revealed that the equivalent volume activity of radon in homes is at a level of 50 Bq/m^3. This is below the highest permissible limit and poses no problem. Problems emerge in rooms where people smoke, because cigarette smoke also contains radon daughter products. (M.D.). 3 figs., 14 refs.

27341 (INIS-mf–13561) **Some improvement of charcoal measurement techniques used for indoor radon measurements in Qatar.** Arafa, W.M.; Alneimi, H.; Al-Houty, L.; About-Leila, H. Qatar Univ., Doha (Qatar). Dept. of Physics; Scientific and Applied Research Center (SARC), Doha (Qatar). [1993]. [14p.] Order Number DE93630670. Source: OSTI; NTIS (US Sales Only); INIS.

Some improvements on charcoal measurement techniques of Rn concentration are suggested. The detection efficiency is increased by using two scintillation detectors instead of commonly used one detector. The optimum exposure time to achieve the best detection accuracy and the lowest minimum detectable level was estimated and found to be of the order of four days. (author).

27342 (IVL-B–1064) **Atmospheric chemical model study of thermal and marine initiation of formation of oxidants at swedish conditions.** Andersson-Skoeld, Y.; Moldanova, J. Swedish Environmental Research Inst., Goeteborg (Sweden). Jun 1992. 28 p.p. (In Swedish). Order Number DE93500683. Source: OSTI; NTIS.

The influence of sea salt particles on oxidant formation has been studied with an atmospheric trajectory model. The results indicate that chlorine formation from sea salt particles in polluted air, with high concentrations of nitrogen oxides and ozone, increase the chemical activity in the atmosphere. The processes responsible can be of great importance in coastal areas with simultaneous emissions of nitrogen oxides and other ozone producing species. The atmospheric influence of the reactions of the nitrate radical with organic species has been studied. The reactions act as a buffer of the chemical activity in the troposphere. The reactions, however, produce increased amounts of organic nitrates and nitrogen dioxide. (7 refs., 19 figs.).

27343 (IVL-B–1079) **Deposition and effects of air pollutants I south and central Sweden.** Westling, O.; Hallgren Larsson, E.; Sjoeblad, K.; Loevblad, G. Swedish Environmental Research Inst., Lammhult (Sweden). IVL-Aneboda. Nov 1992. 109p. (In Swedish). Order Number DE93500686. Source: OSTI; NTIS.

The regional monitoring data on the deposition of acidifying compounds, sulphur and nitrogen, in twelve counties of southern and central Sweden has been evaluated. This base programme involves the collection of deposition in open field and in forest stands at 91 locations with spruce, pine or deciduous vegetation. The effect of acid deposition on the forest ecosystems are described by the chemistry of soilwater from below the vegetative zone in the soils. For most of the study sites, data on needle loss, forest growth, and soil chemistry is also available. Data on needle chemistry is available for the study sites in southwestern Sweden. All available data is combined in a computer database for correlation and evaluation processing. The evaluation shows that regional deposition monitoring depicts the size and distributional pattern of the fallout of sulphur and seasalts well. The monitoring of nitrogen can identify certain regions in southern Sweden that receive a heavy load of nitrogen. Soilwater analyses indicate that large areas in Sweden have heavily acidified forest soils, with low pH values, raised levels of magnesium, calcium, potassium, and high levels of inorganic aluminium. Forest sites, in the coastal regions of southern and southwestern Sweden even have raised inorganic nitrogen levels in soilwater. This evaluation shows a number of statistical methods by which the various data, produced by regional deposition monitoring, can be linked together. Following the recommendations on future monitoring of long-range transported pollutants and the quality of the forest soils by the authorities, the base monitoring programme continues. Deposition monitoring should be completed with the analysis of base cations: calcium, magnesium, sodium and potassium. The possibility to include measurements of nutrients in needles and leaves, and the amount of lichens and algal growth on the trees should be considered. (70 figs., 7 tabs.).

27344 (LA-UR–93-1797) **Numerical simulation of atmospheric dispersion in the vicinity of the Rocky Flats plant.** Bossert, J.E.; Poulos, G.S. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930810–3: Topical meeting on environmental transport and dosimetry, Charleston, SC (United States), 31 Aug - 3 sep 1993). Order Number DE93014562. Source: OSTI; NTIS; INIS; GPO Dep.

The Atmospheric Studies in Complex Terrain (ASCOT) program sponsored a field experiment in the winter of 1991 near Rocky Flats, Colorado. Both meteorological and tracer dispersion measurements were taken. These two data sets provided an opportunity to investigate the influence of terrain-generated, radiatively-driven flows on the dispersion of the tracer. In this study, we use the Regional Atmospheric Modeling System (RAMS) to simulate meteorological conditions and tracer dispersion on the case night of 4–5 February 1991. The simulations were developed to examine the influence of nocturnal drainage flow from various topography regimes on the dispersion of tracer from the Rocky

Flats plant. The simulation described herein demonstrates the extent to which Rocky Mountain drainage winds influence the flow at the mountain/plain interface for a particular case night, and shows the potential importance of canyon drainage on dispersion from the Rocky Flats area.

27345 (LUTMDN-TMVK–5219) **Passive smoke evacuation systems - with reference to Vietnamese multi-storey buildings.** Gustavsson, Irene; Johansson, Anneli. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. Feb 1993. 97p. Order Number DE93500695. Source: OSTI; NTIS.

Examination paper.

The use of indoor combustion devices without proper smoke evacuation is a severe problem in Vietnam, as in many other developing countries. This study is focusing on a solution with a passive design of the smoke evacuation system. In order to form a knowledge basis a field survey concerning kitchen environments was carried out in Hanoi with surroundings. The only way to discharge the smoke to the outside of the house, in a passive way, is to use the natural buoyancy of the hot gases produced during the combustion. It is difficult to reach efficiency in this mechanism - the chimney draught - when using an open fire and in a climate where there is no difference between the indoor and the outdoor temperature. Experiments were performed in Hanoi, in order to see in what way different parameters influenced the draught. An experimental chimney hood was constructed and a number of measurement series were performed and during those the CO-concentration, the particle concentration, and the temperature in the flue pipe were measured. The experiments showed large differences between identical series, which makes it difficult to estimate the influence of the draught. Our conclusion is that it is necessary to use a small smoke gas fan in the flue pipe, in combination with sheltering walls around the fire, if an essential improvement of the indoor environment should be reached.

27346 (NEI-DK–1216) **Atmospheric deposition: 1991 monitoring programme included in the water environment plan.** Faglig rapport fra DMU, 59. Hovmand, M.F.; Grundahl, L.; Kemp, K. Danmarks Miljoeundersoegelser, Roskilde (Denmark). Afd. for Forureningskilder af Luftforurening. Nov 1992. 96p. (In Danish). Order Number DE93500359. Source: OSTI; NTIS.

Atmospheric deposition of nitrogen compounds over the countryside has had a significant influence on plant production in such a way that the addition of nitrogen in woods, heaths and high-lying bogs is the main source of nitrogen supply to the plant communities. The atmospheric conveyance of this nitrogen to Danish inner channels is the main concern of the study. Deposition in the form of rain and of gases and particles is measured from 17 measurement stations. This constitutes between one quarter and one third of the total amount of added nitrogen to Danish inner waters. The results of these measurements are presented. It is concluded from these continuous measurements over the past three years that the atmospheric content of nitrogen dioxide, ammonia and nitrate is partly the result of long-distance transport, mainly by southerly and westerly winds, though ammonia also originates from local Danish sources, especially from farming areas. Sulfur dioxide and sulfates appear to be blown over from sources in Eastern Europe. Sulfur compounds are of special significance with regard to soil acidification. Heavy metals have contributed to the general contamination of land and marine areas. (AB) (23 refs.).

27347 (NEI-DK–1224) **Refrigeration systems with CFC refrigerants: Main report.** Aagaard, H.C.; Bay Moeller, L. Dansk Teknologisk Inst., Taastrup (Denmark). Energiteknologi. Jan 1993. 86 p.p. (In Danish). Order Number DE93500375. Source: OSTI; NTIS.

In 1988, the main project entitled "Refrigeration systems with CFC refrigerants" was established in cooperation with the Danish Energy Agency. The area consists of problems regarding collection, cleansing and recycling related to refrigerating equipment, as well as the use of CFC refrigerants in refrigeration plants, and whether this should be stopped. The six projects, are composed in such a way that they each deal with a specific subject, under one main heading. This publication contains the synopsis report based on the following projects: Regeneration of CFC (R12) and recycling of regenerated CFC for refrigeration purposes (concluded April 1990). Collection and treatment. Examination of equipment for collecting and/or cleansing refrigerants. Recycling possibilities for used CFC. Control of consumption of refrigerants, and Alternative refrigerants for cooling and heat pump systems. The purposes of the projects are given in addition to a synopsis of each one and their conclusions as well as a brief description of how each one was carried out. (AB).

27348 (NEI-DK–1225) **Refrigeration systems with CFC refrigerants: Report no. 2. Collection and treatment.** Martens, P. Dansk Teknologisk Inst., Taastrup (Denmark). Energiteknologi. Jan 1993. 67p. (In Danish). Order Number DE93500377. Source: OSTI; NTIS.

The project comprised the registration of methods and procedures as regards using and handling CFC refrigerants and an analysis of existing methods with regard to future demands for reduction of spillage as well as proposals for procedures which will ensure uniform handling of both present and future refrigerants. The methods described cover the filling, emptying and handling of refrigerant containers including transport. Filling up refrigeration systems can take place either directly from refrigerant containers, possibly by using refrigerant pump or compressor by using a filling glass according to the same principle or by filling up via a filling station. Emptying of refrigeration system or refrigerant is relevant in connection with service, reconstruction and repair or when the refrigeration system is being scrapped. A system has been established with refrigeration containers for used/polluted refrigerants. There is at present no alternative to the filling method used until now. In order to avoid rinsing, evacuation could be made both from the inlet side and the pressure side. It can be necessary to rinse the filling pipes with the refrigerant in order to avoid "mix" or separate filling equipment can be used for each refrigerant. It is no longer usual to let the filling blow out into the open air. The refrigerant is tapped from the evacuation aggregate into the refrigerant containers. If it is intended to recycle a large percentage of the refrigerant collected, a separate refrigerant container must be used for each refrigerant type. The circulation of containers between the producer, wholesaler, refrigerant manufacturer is illustrated in route diagrams. (AB).

27349 (NEI-DK–1226) **Refrigeration systems with CFC refrigerants: Report no. 3. Examination of equipment for collecting and/or cleansing refrigerants.** Bay Moeller, L.; Madsboell, H. Dansk Teknologisk Inst., Taastrup (Denmark). Energiteknologi. Jan 1993. 92 p.p. (In Danish). Order Number DE93500381. Source: OSTI; NTIS.

In connection with reuse of existing CFC refrigerants, it is necessary to know the possibilities for catching and regenerating the drained of refrigerant by means of available equipment. This mainly involves units that can drain off the refrigerant from a system for reuse or destruction, prepare the refrigerant for reuse or prepare the refrigerant for reuse with specifications corresponding with the new refrigerant. Tests were carried out on units intended for cleaning and regeneration. A market research survey showed a preponderance of mobile units that could drain cooling plants and clean the drained refrigerant. The mobile units are typically assembled with small built-in refrigerant vessels, drying filter, filter for chlorine ions, oil separator, and in some cases a system for ventilation of non-condensable gasses. Only few very large units are marketed that claim be able to regenerate the refrigerant. The test were carried out on a refrigerant sample consisting of CFC 12 added given amounts of mineral oils, demineralized water, atmospheric air, hydrochloric acid, and HCFC 22, using Danish produced A'Gramkow and Christonik equipment. Results showed that the tested units can purify CFC 12 of the polluting substances water and hydrochloric acid and that one of the units can purify the mineral oil so that it is close to the standard of a new refrigerant. For the other unit, the content of oil in the cleaned refrigerant was clearly above the requirements of the standard. Neither unit could remove the HCFC 22. (AB).

27350 (NEI-DK–1227) **Refrigeration systems with CFC refrigerants: Report no. 4. Recycling possibilities for used CFC.** Bay Moeller, L. Dansk Teknologisk Inst., Taastrup (Denmark). Energiteknologi. Jan 1993. 87p. (In Danish). Order Number DE93500383. Source: OSTI; NTIS.

The technical conditions regarding possibilities for recycling CFC are investigated, and demands on the refrigerant quality for recycling are stated. In general, the investigation has shown that while there is a new CFC refrigerant available on the market in sufficient amounts and at reasonable prices, and an efficient organization for collection of drained refrigerant has not been formed, it will be difficult to motivate the refrigeration trade to recycle the refrigerants to a larger extent. Estimates have been made for three different scenarios for the installed amount of refrigerant in Denmark and for the development of this to 2006. At this time it is estimated that the last CFC 12 plant is taken out of operation. Calculations indicate that if measures are not taken to improve the density of cooling plants, and if the largest possible amount of CFC 12 is not recycled, then a situation of economic demand will soon arise. This will make it difficult to keep the cooling and freezer plants in operation. The refrigerant situation during the phasing out of the CFC 12 refrigerant in Denmark is calculated. (AB).

27351 (NEI-DK–1228) **Refrigeration systems with CFC refrigerants: Report no. 5. Control of consumpiton of refrigerants.** Voers, L. Dansk Teknologisk Inst., Taastrup (Denmark). Energiteknologi. Jan 1993. 50p. (In Danish). Order Number DE93500387. Source: OSTI; NTIS.

In connection with the control of consumption of refrigerants it is important to measure their path from the importer to final tapping as used refrigerants, as well as cleansing/re-cycling or destruction. The use of CFC as a means of heat transmission in closed refrigeration circuits is mainly dealt with. An on-going control of CFC consumption is required, to avoid reckless use, and endeavour to hold consumption low and keep the re-cycling percentage high. The purpose of the project has been to draw up a set of rules to control consumption of CFC refrigerants from the factory or importer to the end-user, as well as from end-user to re-cycling or destruction. The control system is set up in such a way that it is difficult or impossible for a business to buy/use CFC without having the necessary permission. (CFC Permit). This means that businesses which obtain such permits both are given rights, but are also subject to certain obligations in connection with reporting CFC consumption. The control system "KMO Scheme" was started up 15th April 1992 in cooperation between the Danish Energy Agency, CFC wholesale dealers and the authorised refrigerant firms' trade organization. All businesses must in future be approved by the KMO scheme in order to be able to purchase and handle CFC. The committee must evaluate whether the firm in question is capable of handling CFC in a responsible fashion, with regard to the working environment, the external environment and safety. Firms which use CFC must be able to provide documentation for their competence and must be able to substantiate that they have the necessary equipment to enable them to handle both clean and polluted CFC efficiently. (AB).

27352 (NEI-DK–1229) **Refrigeration systems with CFC refrigerants: Report no. 6. Alternative refigerants for cooling and heat pump systems.** Hoegaard Knudsen, H.J.; Martens, P. Dansk Teknologisk Inst., Taastrup (Denmark). Energiteknologi. Jan 1993. 149p. (In Danish). Order Number DE93500389. Source: OSTI; NTIS.

Approximately 100 refrigerants (alternative to chlorofluorocarbons) were investigated - both clean and mixtures. Detailed refrigerant data are included for: R 123, R 134a, R 142b and R 152a as well as ODP and GWP (halogenated hydrocarbons) values for relevant refrigerants. Methods of conversion of existing systems with R-12 to operation with R-22 are described. Efficiency with R22 will, for the same refrigerating capacity, be the same as for R12. An experimental examination of the use of primarily propane and butance as refrigerants, as well as of the danger of explosion when using gas (butane) as refrigerant in small, hermetic refrigeration systems is described in detail. For the first experiment, the refrigerator door was closed. When the explosion occurred, the door was thrown open, and burns would have been likely within a distance of approximately 1.5 m. For the second experiment, the door was closed and sealed with 5 cm wide canvas tape to simulate child proofing. There would have been risk of injuries if someone had been close to the refrigerator because of the speed at which the door opened. Burns would have been likely within a distance of approximately 1.5 - 2.0 m. For the third experiment, the refrigerator door was closed, sealed and equipped with a galvanized steel band. This time the explosion was so violent that the door was torn off and the tape and the steel band were torn apart. There would have been risk of burns within a distance of 2.0 - 2.5 m, as well as serious injuries. (AB) (49 refs.).

27353 (NUREG/GR–0006) **DEPOSITION: Software to calculate particle penetration through aerosol transport systems: Final report.** Anand, N.K. (Texas A and M Univ., College Station, TX (United States). Dept. of Mechanical Engineering); McFarland, A.R.; Wong, F.S.; Kocmoud, C.J. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; Texas A and M Univ., College Station, TX (United States). Dept. of Mechanical Engineering. Apr 1993. 36p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

User-friendly software (DEPOSITION 2.0) has been developed which permits characterization of aerosol particle losses in transport systems. Tho sub-models which comprise the DEPOSITION code are presented and the limitations of these sub-models are noted. These sub-models have all been previously published in the peer-reviewed literature. The software can be used to determine the penetration aerosol through existing transport systems; it will provide the optimal tube diameter for a transport system operated at a given flow rate and at a given particle size; it will provide a value for the maximum penetration for a transport system that would connect two points in three-dimensional space; and it will provide tables of data and create output files for parametric studies on the effects of varying particle size, flow rate and tube diameter. Use of this software for specific examples is given herewith in an Appendix. Reference to this software is included in NRC Regulatory Guide 8.25 (1992) where it is considered to be an acceptable method for calculating the penetration of particles through sampling systems.

27354 (NUTEK-FBT–93-7) **Heterogeneous reactions between Fe_3O_4 and flue gas components.** Lindstedt, A. (Chalmers Inst. of Technology and Gothenburg Univ. (Sweden). Dept. of Inorganic Chemistry); Abul Milh, M.; Lindqvist, O. Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). 1993. 21p. (In Swedish). Project NUTEK-276-481. Order Number DE93500726. Source: OSTI; NTIS.

Reactions between Fe_3O_4 (magnetite) or Fe_2O_3 (hematite) with flue gas components like O_2, NO, CO and SO_2 have been studied in a fixed bed reactor. The experimental conditions were chosen to simulate the environment in a fluidized bed reactor for coal combustion. Gases were analysed by mass spectrometry. Reaction temperatures were 600-900 deg C and the concentration of the gases were approximately 1000 ppm. No is reduced with the formation of Fe_2O_3 and N_2 as a result. Magnetite is consumed during the reaction due to oxidation to hematite. NO is reduced to N_2. Magnetite reacts with oxygen and is therefore oxidized more quickly in the presence of O_2. The percentage level of reduction of NO over non-oxidized Fe_3O_4 is independent of the NO concentration in the range 200-5000 ppm. At high temperatures and high concentrations of O_2 a net production of NO of about 1-2% was detected. The production of NO might be catalysed by Fe_2O_3, since a net production of NO was detected in the experiments with SO_2 and NO over Fe_2O_3 when O_2 was present. Comparative investigations of the NO reduction capacity were performed with four different magnetites. The specific surface area of the different magnetites could not be related to the NO reduction capacity. Other properties, for example the character of the surface, seems to be of importance. The oxidation of magnetite proceeds slowly in the presence of CO and the capacity for NO reduction therefore increases. SO_2 is oxidised to SO_3 and is only adsorbed in significant amounts at lower temperatures (600 deg C). (17 refs., 12 figs., 2 tabs.).

27355 (OEFZS–4660) **Decontamination strategies in case of satellite crash.** Mueck, K. (Hauptabteilung Strahlenschutz, Bereich Lebenswissenschaften, Forschungszentrum Seibersdorf GmbH, Seibersdorf (Austria)). Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Dec 1992. [31p.] (In German). Order Number DE93628040. Source: OSTI; NTIS (US Sales Only); INIS.

Provided with ISSN 0253-5270.

In order to ensure an optimum search for radioactive debris after a fallout from a satellite with reactor on board in a densely populated country like Austria, measurements with several detectors and search methods (airborne, vehicle and foot-troop search) were performed. The investigated devices comprised the air reconaissance probe, 3'x3', 5'x6', and 331 NaI-detectors as well as semiconductor detectors. The different search methods and their detection limits as well ws the optimum search approach for each detector are compared. Depending on the search area, requirements for each method are derived which should limit the possible dose to the population according to the maximum values as proposed by ICRP for major radiation accidents. From this a search plan is derived in which a specific search method is recommended for each search area according to its utilization type (fields, forests, traffic areas, suburban areas, playing grounds, camping grounds) which ensures that fragments deposited on this area above a given activity are discovered so that a surpassing of a dose of 1 mSv for members of the public becomes extremly unlikely. (author).

27356 (ORNL/FTR–4453) **Acidification of freshwater ecosystems: Foreign trip report, September 25–October 19, 1992.** Van Miegroet, H. Oak Ridge National Lab., TN (United States). 29 Oct 1992. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009935. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler was invited to participate in the Dahlem Workshop on Acidification of Freshwater Ecosystems in Berlin, Germany, September 27–October 2, 1992; to present a seminar and discuss issues related to nitrogen cycling in forest ecosystems at the newly established Bayreuth Institute for Terrestrial Ecology (BITOEK) in Bayreuth, Germany, October 5–6,1992; and to present a seminar and discuss issues related to modeling of atmospheric deposition effects on terrestrial and aquatic ecosystems and concerning European Critical Loads activities with research staff at the National Institute of Public Heath and Environmental Protection in Bilthoven (RIVM), The Netherlands; and at the Winand Staring Center for Integrated Land, Soil, and Water Research (Staring Center) in Wageningen, The Netherlands, October 8–9, 1992.

27357 **Cooler and particulate separator for an off-gas stack.** Wright, G.T. To Dept. of Energy. 8 Apr 1991. USA patent application 7-681,292. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93008216. Source: OSTI; NTIS; GPO Dep.

This report describes an off-gas stack for a melter, furnace or reaction vessel comprising an air conduit leading to two sets of holes, one set injecting air into the off-gas stack near the melter plenum and the second set injecting air downstream of the first set. The first set injects air at a compound angle, having both downward and tangential components, to create a reverse vortex flow, counter to the direction of flow of gas through the stack and also along the periphery of the stack interior surface. Air from the first set of holes prevents recirculation zones from forming and the attendant accumulation of particulate deposits on the wall of the stack and will also return to the plenum any particulate swept up in the gas entering the stack. The second set of holes injects air in the same direction as the gas in the stack to compensate for the pressure drop and to prevent the concentration of condensate in the stack. A set of sprayers, receiving water from a second conduit, is located downstream of the second set of holes and sprays water into the gas to further cool it.

27358 (PNL–8550) **A study of the compliance of the Gaseous Effluent Sampling and Monitoring System with interim criteria: 296-B-10 stack, Waste Encapsulation and Storage Facility.** Schwendiman, L.C.; Glissmeyer, J.A. Pacific Northwest Lab., Richland, WA (United States). Feb 1976. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93009496. Source: OSTI; NTIS; GPO Dep.

A study is underway by Battelle-Northwest to evaluate existing gaseous effluent sampling systems in ARHCO process buildings, including the 225-B Waste Encapsulation and Storage Facility (WESF). An interim report concerning the WESF effluent sampling systems was issued in March of 1975. The objective of this report is to evaluate the compliance of the WESF exhaust stack air sampler and monitor with the interim criteria established by ARHCO, and to recommend corrective actions. This evaluation is based on the previous analysis of the sample collection device contained in BNWL-B-408 and recently gathered information on the sample monitoring instrumentation and sample collection device.

27359 (PNL–8551) **Preliminary evaluation of the gaseous effluent sampling systems at the 291-A-1, 296-A-1, and 296-A-2 stacks:-Purex Plant.** Glissmeyer, J.A.; Schwendiman, L.C. Pacific Northwest Lab., Richland, WA (United States). Jun 1976. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93009495. Source: OSTI; NTIS; GPO Dep.

The particulate effluent sampling and monitoring systems at three Purex Plant Stacks, 291-A-1, 296-A-1, 296-A-2, are the subjects of this evaluation for compliance with Atlantic Richfield Hanford Company's Interim Criteria for such systems (Appendix A). This evaluation is part of a larger study, sponsored by ARHCO and conducted by Battelle-Northwest, of gaseous effluent sampling systems in ARHCO operated facilities. The conclusions and recommendations of this report are considered preliminary because the conclusions have not been experimentally verified and because of the many uncertainties about system characteristics.

27360 (PNL–8552) **Preliminary evaluation of the gaseous effluent sampling system of the 296-P-3 portable exhauster, BY-Tank Farm.** Glissmeyer, J.A.; Schwendiman, L.C. Pacific Northwest Lab., Richland, WA (United States). Mar 1977. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93009499. Source: OSTI; NTIS; GPO Dep.

Cover sheet for a Hanford Historical Document released for public availability.

This evaluation of the 296-P-3 stack sampling system is part of a larger study, sponsored by ARHCO and conducted by Battelle-Northwest, of effluent airborne particulate sampling systems in ARHCO facilities. The 296-P-3 stack is similar to many portable exhauster units deployed in the tank farms. The objectives of this study are: Evaluate the compliance of the particulate sampling system with ARHCO's Interim Criteria for such systems by using sampling theory; make recommendations for corrective action which will lead to a particulate sampling system in compliance with the Interim Criteria; and the conclusions and recommendations are to be generally applicable to sampling systems of the same type as at the 296-P-3 stack. This study is considered preliminary because no experiments have been conducted to verify the sampling system's performance. The following report includes a brief summary, a detailed description and evaluation of the sampling system, conclusions and recommendations for corrective action. The appendices contain a copy of the Interim Criteria, the ARHCO Emergency Procedure regarding radioactive gaseous discharges from this facility and calculations.

27361 (PNL–8553) **Preliminary evaluation of the gaseous effluent sampling system at the 296-S-18 stack, 242-S evaporator.** Glissmeyer, J.A.; Schwendiman, L.C. Pacific Northwest Lab., Richland, WA (United States). Apr 1977. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93009500. Source: OSTI; NTIS; GPO Dep.

This evaluation of the 296-S-18 stack sampling system is part of a larger study, sponsored by ARHCO and conducted by Battelle-Northwest, of gaseous effluent sampling systems in ARHCO facilities. It is the fourth and last in a series of evaluations of tank farm stack sampling systems. The objectives of this study are: Evaluate the compliance of the existing effluent particulate sampling system with ARHCO's Interim Criteria for such systems by using sampling theory and radioactivity counting statistics; and make recommendations for corrective action which will lead to a particulate sampling system in compliance with the Interim Criteria. This study is considered preliminary because no experiments have been conducted to verify the sampling system's performance. The following report includes a brief summary, a detailed description and evaluation of the sampling system, conclusions about

satisfactory or deficient areas of the sampling system and recommendations for corrective action. The appendices contain a copy of the Interim Criteria and the applicable ARHCO Emergency Procedure for radioactive gaseous discharges.

27362 (PNL–8554) **Preliminary evaluation of the gaseous effluent sampling system at the 296-A-17 stack: A, AX, AY, tank farm.** Glissmeyer, J.A.; Schwendiman, L.C. Pacific Northwest Lab., Richland, WA (United States). Dec 1976. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93009497. Source: OSTI; NTIS; GPO Dep.

27364 (PNL-SA–22080) **Statement on global climate change before the Subcommittee on Energy and Power, United States House of Representatives.** Edmonds, J.A. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93013163. Source: OSTI; NTIS; INIS; GPO Dep.

Greenhouse gases are gases which are effectively transparent to incoming sunlight but absorb infrared radiation escaping to space and thereby warm the surface of the Earth. Human activities result in the release of greenhouse and related gases in such quantities that they are changing the composition of the atmosphere. Greenhouse and related gases which human activities release include carbon dioxide (CO_2), methane (CH_4) carbon monoxide (CO), nitrous oxide (N_2O), nitrogen oxides (NO_x), chlorofluorocarbons (CFCs) and sulphur dioxide (SO_2). The emission and effects of these gases are detailed in this report.

27365 (PNL-SA–22390) **Global change research: Science and policy.** Rayner, S. Pacific Northwest Lab., Richland, WA (United States). May 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9305219–1: Global change research: science and policy meeting, Washington, DC (United States), 17 May 1993). Order Number DE93015675. Source: OSTI; NTIS; INIS; GPO Dep.

This report characterizes certain aspects of the Global Change Research Program of the US Government, and its relevance to the short and medium term needs of policy makers in the public and private sectors. It addresses some of the difficulties inherent in the science and policy interface on the issues of global change. Finally, this report offers some proposals for improving the science for policy process in the context of global environmental change.

27366 (PNWD–2033-HEDR-Vol.2) **Iodine-131 releases from the Hanford Site, 1944–1947: Volume 2, Data: Hanford Environmental Dose Reconstruction Project.** Heeb, C.M. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 229p. Sponsored by Department of Health and Human Services, Washington, DC (United States). DOE Contract AC06-76RL01830. Contract 200-92-053(CDC)/18620(BNW). Order Number DE93011908. Source: OSTI; NTIS; INIS; GPO Dep.

Detailed results of the Hanford Environmental Dose Reconstruction project (HEDR) iodine-131 release reconstruction are presented in this volume. Included are daily data on B, D, and F Plant, reactor operations from the P-Department Daily Reports (General Electric Company 1947). Tables of B and T Plant material processed from the three principal sources on separations plant operations: The Jaech report (Jaech undated), the 200 Area Report (Acken and Bird 1945; Bird and Donihee 1945), and the Metal History Reports (General Electric Company 1946). A transcription of the Jaech report is also provided because it is computer-generated and is not readily readable in its original format. The iodine-131 release data are from the STRM model. Cut-by-cut release estimates are provided, along with daily, monthly, and yearly summations. These summations are based on the hourly release estimates. The hourly data are contained in a 28 megabyte electronic file. Interested individuals may request a copy.

27367 (SAND–93-1031C) **Environmentally conscious manufacturing life cycle analysis.** Watkins, R.D.; Baca, A. Sandia National Labs., Albuquerque, NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9305187–3: Ideas in science and electronics, Albuquerque, NM (United States), 11 May 1993). Order Number DE93014992. Source: OSTI; NTIS; INIS; GPO Dep.

Sandia National Laboratories and the Allied Signal-Kansas City Plant (AS-KCP) are engaged in a program called the Integrated Manufacturing and Design Initiative, or IMDI. The focus of IMDI is "to develop and implement concurrent engineering processes for the realization of weapon components." An explicit part of each of the activities within IMDI is an increased concern for environmental impacts associated with design, and a desire to minimize those impacts through the implementation of Environmentally Conscious Manufacturing, or ECM. These same concerns and desires are shared within the Department of Energy's Manufacturing Complex, and are gaining strong support throughout US industrial sectors as well. Therefore, the development and application of an environmental life cycle analysis framework, the thrust of this specific effort, is most consistent not only with the overall objectives of IMDI, but with those of DOE and private industry.

27368 (SCPRI-RM–1-1993) **Monthly results of measurements; January 1993.** Service Central de Protection contre les Rayonnements Ionisants, 78 - Le Vesinet (France). 1993. [41p.] (In French). Order Number DE93630787. Source: OSTI; NTIS (US Sales Only); INIS.

This report of the SCPRI exposes the main results concerning the routine monitoring of environmental radioactivity in France: atmospheric dusts, rainwater, surface water, underground water, sewage water, drinking water, food chain (milk, vegetables, fishes), sea water around nuclear sites and other sites. The activities of various radioisotopes are presented in tables.

27369 (TVA/NFERC–92/6) **Environmental awareness.** National Fertilizer and Environmental Research Center, Muscle Shoals, AL (United States). [1992]. 38p. Sponsored by Tennessee Valley Authority, Knoxville, TN (United States). (TVA-Bull–Y-228). Order Number DE93014192. Source: OSTI; NTIS.

This brochure is intended to provide guidance on environmental regulations to National Fertilizer and Environmental Research Center (NFERC) employees. Topics covered include: handling of hazardous materials, disposal of hazardous wastes, spill prevention and remediation, pcb contamination, pesticide use, asbestos remediation, solid waste disposal, and environmental laws. Safety aspects are emphasized.

27370 (UCRL-CR–109856) **Modeling of aqueous chemistry in cloud droplets.** Kreidenweis, S.M. (San Jose State Univ., CA (US)). Lawrence Livermore National Lab., CA (United States). Feb 1992. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93015010. Source: OSTI; NTIS; GPO Dep.

The code AQCHEM.FOR, a listing of which is attached, has been prepared as a tool for the investigation of chemical reactions occurring in cloud drops. The present application is to the formation of sulfate (S(VI)) via reaction of S(IV) species with ozone and hydrogen peroxide. However, the model is constructed in a general format that allows introduction of other species and reactions easily. The model also stimulates mass transfer between the liquid and gas phases, so that the assumption of equilibrium between these phases need not be invoked. Representative model simulations are presented and show good agreement with results published from similar codes. The model will be used to develop parameterizations of aqueous sulfate production rates for inclusion in a global model of the sulfur cycle.

27371 (UCRL-ID–112181) **The "footprint" area influencing a high-volume air sampler.** Shinn, J.; Gouveia, F. Lawrence Livermore National Lab., CA (United States). Oct 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013947. Source: OSTI; NTIS; GPO Dep.

A recent question posed by air sampling analysts is how to calculate the source area that contributes to the collection of material by a high-volume (HV) air sampler. In micrometeorology studies theoretical and numerical approaches have been used to determine the "footprint" of an atmospheric flux from the ground that influences a sensor at any given height. Over the course of a few days or more, the influence of atmospheric stability on a high volume air sampler run can be neglected. For surfaces that have dense vegetative cover, the boundary layer is displaced upward by the vegetation height and the roughness is proportional to the vegetation height. It can be concluded that for typical surface conditions, the HV air sampler is 90% influenced by material flux from the surface less than 145–175 m upwind. For rougher surfaces, the upwind bounded distances are shorter. There may be some very specialized cases (e.g., empty parking lots) where the upwind bounded distances are much greater.

27372 (UCRL-ID–112984) **Preliminary meteorological results for 1992 West Coast Scotland Experiment.** Robey, H.F. Lawrence Livermore National Lab., CA (United States). 4 Jan 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014677. Source: OSTI; NTIS; GPO Dep.

This memo documents preliminary meteorological results from the 1992 West Coast Scotland Experiment, a joint US/UK radar ocean imaging experiment. Measurements of wind speed and direction are reported for both phases of the experiment covering the periods from June 7–13 and from June 19–25. The measurements were obtained using a Campbell Scientific CR10 Datalogger and R. M. Young model 03001-5 anemometer and wind wane. The anemometer has a resolution of 0.1 m/s and the wind vane 1°, but motion of the ship platform reduces the precision of the direction measurements to ±10°. Data were downloaded to an IBM PC-AT for final storage and analysis. The anemometer was mounted at a height of 10 meters above the mean water surface on top of a mast located at the bow of the Royal Marine Auxiliary Service (R.M.A.S.) tug, "Cairn". The Cairn was moored at the center of the experiment site at 57°7.13755' N, 5°44.88521' W in the Sound of Sleat, nominally 200 meters from the ship track. Wind velocity and direction were recorded at a sample rate of 0.2 Hz, and the averaged value was output every 10 minutes from approximately 2 hours before the start of the first run to 2 hours after the end of the last run. Data are plotted in the following pages in 2 formats for a quick visual summary of the daily wind conditions. The top plot gives wind velocity (m/s) and direction (degrees true) vs time given in minutes relative to the start of the first run which is designated as "T". The lower plot gives a polar plot of the same data with velocity on the radial axis and direction on the azimuthal axis. The final two plots give a summary of the wind speed vs direction for phase 1 (June 7–13) and phase 2 (June 19–25).

27373 (UCRL-JC–110318) **Stratospheric ozone conservation by electron attachment to chlorine atoms.** Tsang, K.T. (Science Applications International Corp., McLean, VA (United States)); Ho, D.D.M.; Wong, A.Y.; Siverson, R.J. Lawrence Livermore National Lab., CA (United States). 23 Apr 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-900922–1: Workshop on removal of particles from upper atmosphere by means of electromagnetic and plasma waves: active global experiments, Varenna (Italy), 5-12 Sep 1990). Order Number DE93009242. Source: OSTI; NTIS; GPO Dep.

The feasibility of recent proposal by Wong to stop stratospheric ozone destruction by converting neutral chlorine atoms into negative ions is investigated with a detailed numerical chemistry model. Two cases, which lead to estimates of the upper and lower bounds of the conversion efficiency, are studied. In the first case, electrons are introduced to a steady state of atmospheric chemical equilibrium. Up to 90% of the electrons are eventually attached to the chlorine atoms to form chlorine ions or water clusters of chlorine ions ($Cl^- \cdot H_2O$). In the second case, a plasma of electrons and ions is produced by intense microwave ionization of the background neutral nitrogen and oxygen molecules. Because of the large number of electrons lost in recombinations, roughly 1% of the electrons are attached to the chlorine atoms. However, since the conventional recombination rates we used in the modeling are much higher than that implied by recent experiments, this result is an underestimate of the actual conversion efficiency.

27374 (UCRL-JC–110365) **Modeling of air currents in the Gulf Region.** Sullivan, T.J.; Ellis, J.S.; Foster, C.S.; Foster, K.T.; Baskett, R.L.; Nasstrom, J.S.; Schalk, W.W. Lawrence Livermore National Lab., CA (United States). 14 Apr 1992. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9204242–1: Environmental dimensions of the Gulf: policy and institutional perspectives workshop, Al-Ain (United Arab Emirates), 19-22 Apr 1992). Order Number DE93010509. Source: OSTI; NTIS; INIS; GPO Dep.

The Atmospheric Release Advisory Capability modeled the wind flow in the Gulf Region in order to make projections of the Kuwait oil fires pollution dispersion. Extensive meteorological models incorporating explicit terrain influences to the flow fields were routinely employed through a six month international assessment support effort organized by the World Meteorological Organization and US scientific research agencies. Results show generally close agreement with visible imagery of the smoke plumes as detected by meteorological satellites. However, there are some examples of significant disagreement or failure of the meteorological models. These failures are most likely directly linked to missing or unavailable weather observations.

27375 (UCRL-JC–110401) **Risk assessment of DOE defense program packages in a beyond 10 CFR 71.73 transportation accident environment.** Sandquist, G.M. (Utah Univ., Salt Lake City, UT (United States). Dept. of Nuclear Engineering); Bennion, J.S.; Moore, J.E.; Kimura, C.Y. Lawrence Livermore National Lab., CA (United States). 15 Oct 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9301102–4: American Nuclear Society (ANS) meeting, Clearwater, FL (United States), 27 Jan 1993). Order Number DE93012573. Source: OSTI; NTIS; INIS; GPO Dep.

A comprehensive program is being conducted by the DOE to determine the risks related to the domestic transportation of radioactive and hazardous materials associated with nuclear weapons. The program is designed to identify, quantify and manage potential risks to public health and safety including potential radiological and toxicological health consequences which may exceed the 10 CFR 71.73 transportation accident environment A major objective of this program being performed by the Lawrence Livermore National Laboratory (LLNL) and the University of Utah is to provide the DOE with the methodology and bases for evaluating highway transportation activities by DOE contractors. This paper describes the approach and the HITRA model which is based upon probabilistic risk assessment (PRA) methodology and route specific data associated with the proposed transportation activity. The model is capable of providing detailed location and time specific data for assessing projected risks to public health and safety from DOE defense program materials shipments.

27376 (UCRL-JC–111416) **A real-time emergency response workstation using a 3-D numerical model initialized with sodar.** Lawver, B.S. (Lawrence Livermore National Lab., CA (US)); Sullivan, T.J.; Baskett, R.L. Lawrence Livermore National Lab., CA (United States). 28 Jan 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930140–4: International specialty conference: the role of meteorology in managing the environment in the 1990s, Scottsdale, AZ (United States), 26-28 Jan 1993). Order Number DE93016534. Source: OSTI; NTIS; GPO Dep.

Many emergency response dispersion modeling systems provide simple Gaussian models driven by single meteorological tower inputs to estimate the downwind consequences from accidental spills or stack releases. Complex meteorological or terrain settings demand more sophisticated resolution of the three-dimensional structure of the atmosphere to reliably calculate plume dispersion. Mountain valleys and sea breeze flows are two common examples of such settings. To address these complexities, the authors have implemented the three-dimensional diagnostic MATHEW mass-adjusted wind field and ADPIC particle-in-cell dispersion models on a workstation for use in real-time emergency response modeling. MATHEW/ADPIC have shown their utility in a variety of complex settings over the last 15 years within the Department of Energy's Atmospheric Release Advisory Capability (ARAC) project. The models are initialized using an array of surface wind measurements from meteorological towers coupled with vertical profiles from an acoustic sounder (sodar). The workstation automatically acquires the meteorological data every 15 minutes. A source term is generated using either defaults or a real-time stack monitor. Model outputs include contoured isopleths displayed on site geography or plume densities shown over 3-D color shaded terrain. The models are automatically updated every 15 minutes to provide the emergency response manager with a continuous display of potentially hazardous ground-level conditions if an actual release were to occur. Model run time is typically less than 2 minutes on 6 megaflop (~30 MIPS) workstations. Data acquisition, limited by dial-up modem communications, requires 3 to 5 minutes.

27377 (UCRL-JC–113583) **Factors influencing the parameterization of anvil clouds within GCMs.** Leone, J.M. Jr.; Chin, Hung-Neng. Lawrence Livermore National Lab., CA (United States). Mar 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9303122–5: 3. ARM science team meeting, Norman, OK (United States), 1-5 Mar 1993). Order Number DE93017182. Source: OSTI; NTIS; INIS; GPO Dep.

The overall goal of this project is to improve the representation of clouds and their effects within global climate models (GCMs). The authors have concentrated on a small portion of the overall goal, the evolution of convectively generated cirrus clouds and their effects on the large-scale environment. Because of the large range of time and length scales involved they have been using a multi-scale attack. For the early time generation and development of the cirrus anvil they are using a cloud-scale model with horizontal resolution of 1–2 kilometers; while for the larger scale transport by the larger scale flow they are using a mesoscale model with a horizontal resolution of 20–60 kilometers. The eventual goal is to use the information obtained from these simulations together with available observations to derive improved cloud parameterizations for use in GCMs. This paper presents results from their cloud-scale studies and describes a new tool, a cirrus generator, that they have developed to aid in their mesoscale studies.

27378 (WINCO–1128) **ICCP Environmental Monitoring Report CY-1992.** Neff, J.K. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). Jul 1993. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. Order Number DE93015610. Source: OSTI; NTIS; INIS; GPO Dep.

Summarized in this report are the data collected through Environmental Monitoring programs conducted at the Idaho Chemical Processing Plant (ICPP) by the Environmental Safety & Health (ES&H) Department. This report is published in response to DOE Order 5400.1. This report covers the period from December 21, 1991 through December 20, 1992 and details airborne and liquid effluents from the Chemical Processing Plant.

27379 (WSRC-TR–93-215) **Assessment of radiocarbon in the Savannah River Site Environment.** Carlton, W.H.; Evans, A.G.; Murphy, C.E. Jr.; Tuck, D.M. Westinghouse Savannah River Co., Aiken, SC (United States). Mar 1993. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014759. Source: OSTI; NTIS; INIS; GPO Dep.

This report is a radiological assessment of ^{14}C releases from the Savannah River Site. During the operation of five production reactors ^{14}C has been produced at SRS. Approximately 3000 curies have been released to the atmosphere but there are no recorded releases to surface waters. Once released, the ^{14}C joins the carbon cycle and a portion enters the food chain. The overall radiological impact of SRS releases on the offsite maximum individual can be characterized by a dose of 1.1 mrem, compared with a dose of 12,960 mrem from non-SRS sources during the same period of time. Releases of ^{14}C have resulted in a negligible risk to the environment and the population it supports.

27380 (ANL/EAIS–8) **Data collection handbook to support modeling the impacts of radioactive material in soil.** Yu, C. (Argonne National Lab., IL (United States). Environmental Assessment and Information Sciences Div.); Cheng, J.J.; Jones, L.G.; Wang, Y.Y.; Faillace, E.; Loureiro, C.; Chia, Y.P. Argonne National Lab., IL (United States). Environmental Assessment and Information Sciences Div. Apr 1993. 152p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93015606. Source: OSTI; NTIS; INIS; GPO Dep.

A pathway analysis computer code called RESRAD has been developed for implementing US Department of Energy Residual Radioactive Material Guidelines. Hydrogeological, meteorological, geochemical, geometrical (size, area, depth), and material-related (soil, concrete) parameters are used in the RESRAD code. This handbook discusses parameter definitions, typical ranges, variations, measurement methodologies, and input screen locations. Although this handbook was developed primarily to support the application of RESRAD, the discussions and values are valid for other model applications.

27381 (ANL/ER/CP–79580) **A technical approach to groundwater contamination problems.** Burton, J.C.; Leser, C.; Rose, C.M. Argonne National Lab., IL (United States). [1993]. 7p.

Sponsored by USDOE, Washington, DC (United States); Department of Agriculture, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9306159–2: 1993 Society of Women Engineers (SWE) conference, Chicago, IL (United States), 21-27 Jun 1993). Order Number DE93014876. Source: OSTI; NTIS; INIS; GPO Dep.

Argonne National Laboratory has been performing technical investigations at sites in Nebraska and Kansas that have identified groundwater contamination by carbon tetrachloride. This comprehensive program will ultimately provide the affected communities with safe drinking water. The first step in the program is to evaluate the available data and identify sites that will require an Alternate Water Supply Study (AWSS). The objective of the AWSS is to identify options for providing a safe drinking water supply to all users, in compliance with the Safe Drinking Water Act. The AWSS consists of an engineering and cost evaluation followed by implementation of the selected alternative. For sites with contamination less than a specific concentration, the AWSS is regarded as a satisfactory long- term solution, and no further action is taken. For those sites with concentrations above that specific limit, the AWSS implementation is regarded as only a stopgap measure, and the site is selected for additional remedial action. The first step of the remedial action is an Expedited Site Characterization (ESC). The ESC was developed at Argonne to decrease the cost and time of the remedial investigation and feasibility study while producing a high-quality technical investigation. The ESC is designed to characterize the contaminant plume configuration and movement, which requires an understanding of the geological and hydrogeologic controls on groundwater movement as well as the nature and extent of any remaining carbon tetrachloride source in the soils. The ESC program uses a multidisciplinary technical approach that incorporates geology, geochemistry, geohydrology, and geophysics. Field activities include sampling, chemical analysis, and borehole and surface geophysical surveys.

27382 (ANL/ES/CP–77816) **Gas-rich sediment and coastal wetland loss in Louisiana.** Thompson, M.D.; McGinnis, L.D.; Wilkey, P.L.; Miller, S.F. Argonne National Lab., IL (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States); Gas Research Inst., Chicago, IL (United States). DOE Contract W-31109-ENG-38. Contract 5088-252-1770. (CONF-9304109–2: SAGEEP '93: symposium on the application of geophysics to environmental and engineering problems, San Diego, CA (United States), 18-21 Apr 1993). Order Number DE93009963. Source: OSTI; NTIS; GPO Dep.

High rates of wetland loss in southern Louisiana provide the impetus for examining the role that trapped, biogenic gases play in regulating subsidence of coastal areas. A significant cause for wetland loss in this region is relative sea-level rise produced by sediment-volume reduction. Dewatering, grain reorientation and packing, and oxidation of organic-rich sediments are thought to be the main processes for volume loss. It is argued that natural and anthropogenic causes for sediment degasification play a critical role in sediment-volume reduction. Compressional wave velocities were measured at 34 sites in both the abandoned (Holocene) and modern parts of the Mssissippi Delta. A low-frequency source (<200 Hz) was used to maximize sound-wave dispersion caused by interstitial gas bubbles. Compressional wave velocities measured at low frequencies relative to the gas-bubble resonant-frequency undergo maximum change from the velocity for a gas-free sediment.

27383 (ARL-TR–086) **Properties of plutonium-contaminated particles resulting from British Vixen B trials at Maralinga.** Burns, P.A. (Australian Radiation Lab., Melbourne, VIC (Australia)); Cooper, M.B.; Williams, G.A.; Johnston, P.N. Australian Radiation Lab., Melbourne, VIC (Australia). Dec 1990. [23p.] Order Number DE93630629. Source: OSTI; NTIS (US Sales Only); INIS.

Meteorological data and characteristics of active particles from Maralinga are presented in Appendixes.

Since 1984 a number of studies have been performed to investigate residual contamination at the former atomic weapons test site at Maralinga in South Australia, and to aid in the rehabilitation of the area. The largest site of plutonium contamination at Maralinga results from twelve Vixen B trials conduced at Taranaki in 1960, 1961 and 1963. Plutonium was dispersed along four major plumes from these trials. Measurements of the ratios of activities of ^{239}Pu and ^{240}Pu to ^{241}Am are presented for the plumes. These are identified with individual trials where possible. Some measurements have also been made of ^{235}U activities. An examination of meteorological and health physics survey data suggests that the most extensive part of the north-west plume results from a single trial, viz. Vixen B2 round 5 of 1961. It appears that the level of contamination in this plume was augmented by rainout of material, and the extent of the plume was enhanced by the considerable wind speed at the time. Results of proton-induced X-ray emission spectroscopy (PIXE), which provides elemental content and maps of the distribution of elements on the surface of some of the active particles, are presented, together with some other physical characteristics of the particles, in the expectation that these will aid in hazard assessment and with the development of techniques to rehabilitate the Taranaki site at Maralinga. 17 refs., 4 tabs., 1 fig.

27384 (BNL–70222) **[Participation in United Nations environmental projects]: Foreign trip report, September 9–14, 1992.** Hendrey, G.R. Brookhaven National Lab., Upton, NY (United States). 20 Sep 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93012357. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Traveler was invited to participate in a scientific review of United Nations Environmental Programme (UNEP) Project Number FP/6108-88-01(2855), titled Environmental Change and the Productivity of Tropical Grasslands running from 1989 through 1992. Tropical grasslands constitute one of the world's largest and most productive ecosystems and sustain populations of millions of people in less developed nations on five of the seven continents. Anticipated changes in global climate have stimulated interest in developing a better understanding of these ecosystems in order to plan for rational management. in particular, increasing atmospheric CO2 and temperature may alter no only rates of photosynthesis, plant growth and plant community dynamics, but also the efficiency of water use, and availability of ground water. This UNEP project addresses such issues at five intensive research sites in Brazil, China, Kenya, Mexico and Thailand emphasizing primary productivity and photosynthesis, with special-focus on carbon cycling, remote sensing and responses to elevated CO2. The project has completed five of seven of the tasks specified in the research plan. Of greatest interest is the development of intensive research sites at the five locales, together with education of the scientific teams making up the core groups at these sites; and successful development and completion of intensive training courses for the measurement of plant production processes in the field.

27385 (CONF-9210354–1) **On the potential for a CO_2 fertilization effect in forest trees: An assessment of 58 controlled-exposure studies and estimates of the biotic growth factor.** Wullschleger, S.D.; Post, W.M.; King, A.W. Oak Ridge National Lab., TN (United States). [1992]. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From IPCC international workshop on biotic feedbacks in the global climate system; Woods Hole, MA (United States); 25-29 Oct 1992. Order Number DE93013530. Source: OSTI; NTIS; INIS; GPO Dep.

Characterizing the response of terrestrial ecosystems to increasing concentrations of atmospheric CO_2 and estimating their biological capacity to either moderate or accelerate predicted changes in the earth's climate, continues to present a formidable challenge to experimentalist and modelers alike. Nevertheless, it is generally recognized that the carbon dynamics of terrestrial vegetation represent an important biospheric feedback to increasing CO_2 concentrations, and hence to global warming, and as such there exists little debate that ecosystems occupy a.potentially pivotal role in determining both the direction and rate of future changes in atmospheric CO_2 concentration. What is currently the subject of much debate, however, is whether terrestrial ecosystems will contribute to global warming by releasing additional CO_2 the atmosphere as a result of increasing respiration and/or decomposition in a warming climate, or whether they will instead sequester additional carbon in response to the enhancing effects of atmospheric CO_2 on plant growth. This latter response, the so-called CO_2 fertilization effect, has been hypothesized as an important

negative feedback to global warming, offering the potential to constrain future increases in atmospheric CO_2 concentration, and has often been invoked to either partially or wholly account for the estimated 1.6 Gt C/year imbalance or "missing sink" in calculations of the global carbon budget.

27386 (CONF-930165–3) **Risk implications of approaches to setting soil remediation goals.** Labieniec, P.A. (Carnegie Mellon Univ., Pittsburgh, PA (US). Dept. of Civil Engineering); Dzombak, D.A.; Siegrist, R.L. Oak Ridge National Lab., TN (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Water Federation Environment specialty conference on how clean is clean; Washington, DC (United States); 10-13 Jan 1993. Order Number DE93015185. Source: OSTI; NTIS; GPO Dep.

A framework has been developed to evaluate and compare the carcinogenic risk implications of two approaches to establishing soil remediation goals at hazardous waste contaminated sites. The approaches considered are (1) site-specific risk assessment to achieve a specified level of carcinogenic risk and (2) the use of uniform, concentration-based soil quality guidelines. Uncertainty in site-specific risk assessments and variability in site conditions when a uniform approach is used are taken into account. For each approach, cumulative distribution functions representing the regional variability in risk across sites are developed using a soil risk model. The two approaches are then compared based on these distributions. This paper describes the evaluation framework and presents some preliminary results of ongoing research to apply the framework to sites contaminated with trichloroethylene (TCE). Preliminary work in applying the framework to sites contaminated with polychlorinated biphenyls (PCBs) is also described.

27387 (CONF-930483–10) **A life-cycle model approach to multimedia waste reduction measuring performance for environmental cleanup projects.** Phifer, B.E. Jr. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (US)); George, S.M. Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States). [1993]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 9. waste minimization and pollution prevention conference; San Francisco, CA (United States); 13-15 Apr 1993. Order Number DE93016234. Source: OSTI; NTIS; INIS; GPO Dep.

The Martin Marietta Energy Systems, Inc. (Energy Systems), Environmental Restoration (ER) Program adopted a Pollution Prevention Program in March 1991. The program's mission is to minimize waste and prevent pollution in remedial investigations (RIs), feasibility studies, decontamination and decommissioning, and surveillance and maintenance site program activities. Mission success will result in volume and/or toxicity reduction of generated waste. The ER Program waste generation rates are projected to steadily increase through the year 2005 for all waste categories. Standard production units utilized to measure waste minimization apply to production/manufacturing facilities. Since ER inherited contaminated waste from previous production processes, no historical production data can be applied. Therefore, a more accurate measure for pollution prevention was identified as a need for the ER Program. The Energy Systems ER Program adopted a life-cycle model approach and implemented the concept of numerically scoring their waste generators to measure the effectiveness of pollution prevention/waste minimization programs and elected to develop a numerical scoring system (NSS) to accomplish these measurements. The prototype NSS, a computerized, user-friendly information management database system, was designed to be utilized in each phase of the ER Program. The NSS was designed to measure a generator's success in incorporating pollution prevention in their work plans and reducing investigation-derived waste (IDW) during RIs. Energy Systems is producing a fully developed NSS and actually scoring the generators of IDW at six ER Program sites. Once RI waste generators are scored utilizing the NSS, the numerical scores are distributed into six performance categories: training, self-assessment, field implementation, documentation, technology transfer, and planning.

27388 (CONF-930570–2) **The application of GIS and remote sensing technologies for site characterization and environmental assessment.** Durfee, R.C.; McCord, R.A.; Dobson, J.E. Oak Ridge National Lab., TN (United States). [1993]. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 2. annual Federal environmental restoration conference and exhibition; Washington, DC (United States); 25-27 May 1993. Order Number DE93015435. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental cleanup and restoration of hazardous waste sites are major activities at federal facilities around the US. Geographic information systems (GIS) and remote sensing technologies are very useful computer tools to aid in site characterization, monitoring, assessment, and remediation efforts. Results from applying three technologies are presented to demonstrate examples of site characterization and environmental assessment for a federal facility. The first technology involves the development and use of GIS within the comprehensive Oak Ridge Environmental Information System (OREIS) to integrate facility data, terrain models, aerial and satellite imagery, demographics, waste area information, and geographic data bases. The second technology presents 3-D subsurface analyses and displays of groundwater and contaminant measurements within waste areas. In the third application, aerial survey information is being used to characterize land cover and vegetative patterns, detect change, and study areas of previous waste activities and possible transport pathways. These computer technologies are required to manage, analyze, and display the large amounts of environmental and geographic data that must be handled in carrying out effective environmental restoration.

27389 (DOE/ER/60253–9) **Rangeland – plant response to elevated CO_2: Progress report, 1993.** Owensby, C.E.; Coyne, P.I.; Ham, J.M.; Parton, W.; Rice, C.; Auen, L.M.; Adam, N. Kansas State Univ., Manhattan, KS (United States). Dept. of Agronomy. 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER60253. Order Number DE93017058. Source: OSTI; NTIS; INIS; GPO Dep.

Plots of a tallgrass prairie ecosystem were exposed to ambient and twice-ambient CO_2 concentrations in open-top chambers and compared to unchambered ambient CO_2 plots during the entire growing season from 1989 through 1992. Relative root production among treatments was estimated using root ingrowth bags which remained in place throughout the growing season. Latent heat flux was simulated with and without water stress. Botanical composition was estimated annuallyin all treatments. Open-top chambers appeared to reduce latent heat flux and increase water use efficiency similar to elevated CO_2 when water stress was not severe, but under severe water stress, chamber effect on water use efficiency was limited. In natural ecosystems with periodic moisture stress, increased water use efficiency under elevated CO_2 apparently would have a greater impact on productivity than photosynthetic pathway. Root ingrowth biomass was greater in 1990 and 1991 on elevated CO_2 plots compared to ambient or chambered-ambient plots. In 1992, there was no difference in root ingrowth biomass among treatments.

27390 (DOE/ER/60633–8) **Mass and energy budgets of animals: Behavioral and ecological implications: Annual technical progress report, April 1, 1992–March 31, 1993.** Porter, W.P. Wisconsin Univ., Madison, WI (United States). [1993]. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER60633. Order Number DE93016205. Source: OSTI; NTIS; GPO Dep.

The common goal of these diverse projects is to understand the mechanisms of how animal populations respond to the continual changes in their environment in both time and space. Our models are mechanistic allowing us to explore how a wide array of environmental variables may determine individual performance. Large scale climate change and its effect on animal populations can be seen as quantitative extensions of biological responses to smaller scales of environmental variability. Changes in developmental rates or reproductive levels of individuals, extension or contraction of geographic ranges, and modification of community organization have all been documented in response to previous changes in habitats. We know from our biophysical work that some changes in function are driven by microclimate conditions directly, and some are mediated indirectly through ecological parameters such as the food supply. Our research is guided by a comprehensive conceptual

scheme of the interaction of an animal with its environment. The physical and physiological properties of the organism, and the range of available microclimates, set bounds on the performance of organismal function, such as growth, reproduction, storage, and behavior. To leave the most offspring over a lifetime, animals must perform those functions in a way that maximizes the amount of resources devoted to reproduction. Maximizing the total size of the budget and minimizing those budget items not devoted to reproduction are crucial. Animals trade off among expenditures for current and future reproduction. Both water and energy are important, potentially limiting resources. Projects described here include empirical studies and theoretical models.

27391 (DOE/ER/60665–T2) **An investigation of the geology and geochemistry of radon in shear zones.** Schumann, R.R. (Geological Survey, Denver, CO (United States)); Stanton, M.R.; Gundersen, L.C.S.; Gates, A.E.; Schultz, A.P.; Speer, J.A. Geological Survey, Denver, CO (United States). [1991]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-88ER60665. Order Number DE93014397. Source: OSTI; NTIS; GPO Dep.

In this study we will characterize the four principal geologic terrains that cause the highest and most extensive indoor radon problems in the United States, we will predict their national distribution, and we will define the climatic and chemical processes that affect uranium and radium siting in rocks and soils, and ultimately their emanation and radon potential. We have chosen nine sheared granite plutons from different climatic areas across the United States, two faulted carbonate terrains from an and area and a humid area, and three sites within the fractured Pierre shale and the glacial deposits derived from it in the northern Great Plains. The results of our studies for the last four years have established that in order to understand and accurately predict radon transport and availability in rocks, soils, and ground water, the factors affecting radon emanation must be quantitatively described and basic models developed to understand the processes involved. Three phases of the project were worked on this (1) Preliminary assessment of the Alleghenian granites and compilation of data for establishing the relation between heat flow and radon production and availability, (2) development of a field emanation protocol, and (3) ongoing geochemical examination of shear zone processes.

27392 (DOE/ID/13042–5) **A comparative evaluation of conceptual models for the Snake River Plain aquifer at the Idaho Chemical Processing Plant, INEL.** Prahl, C.J. Idaho INEL Oversight Program, Boise, ID (United States). Jan 1992. 136p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-91ID13042. Order Number DE93012948. Source: OSTI; NTIS; INIS; GPO Dep.

Thesis submitted to Univ. of Idaho, Moscow, ID.

Geologic and hydrologic data collected by the United States Geological Survey (USGS) are used to evaluate the existing ground water monitoring well network completed in the upper portion of the Snake River Plain aquifer (SRPA) beneath the Idaho Chemical Processing Plant (ICPP). The USGS data analyzed and compared in this study include: (a) lithologic, geophysical, and stratigraphic information, including the conceptual geologic models intrawell, ground water flow measurement (Tracejector tests) and (c) dedicated, submersible, sampling group elevations. Qualitative evaluation of these data indicate that the upper portion of the SRPA is both heterogeneous and anisotropic at the scale of the ICPP monitoring well network. Tracejector test results indicate that the hydraulic interconnection and spatial configuration of water-producing zones is extremely complex within the upper portion of the SRPA. The majority of ICPP monitoring wells currently are equipped to sample ground water only the upper lithostratigraphic intervals of the SRPA, primarily basalt flow groups E, EF, and F. Depth-specific hydrogeochemical sampling and analysis are necessary to determine if ground water quality varies significantly between the various lithostratigraphic units adjacent to individual sampling pumps.

27393 (DOE/ID/13042–7) **Moscow Test Well, INEL Oversight Program: Aqueous geochemistry.** McCurry, M. (Idaho State Univ., Pocatello, ID (United States)); Fromm, J.; Welhan, J. Idaho INEL Oversight Program, Boise, ID (United States). 29 Sep 1992. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-91ID13042. Order Number DE93012950. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents a summary and interpretation of data gathered during sampling of the Moscow Test Well at Moscow, Idaho during April and May of 1992. The principal objectives of this chemical survey were to validate sampling procedures with a new straddle packer sampling tool in a previously hydrologically well characterized and simple sampling environment, and to compare analytical results from two independent labs for reproducibility of analytical results. Analytes included a wide range of metals, anions, nutrients, BNA's, and VOC's. Secondary objectives included analyzing of waters from a large distilled water tank (utilized for all field laboratory purposes as "pure" stock water), of water which passed through a steamer used to clean the packer, and of rinsates from the packer tool itself before it was lowered into the test well. Analyses were also obtained of blanks and spikes for data validation purposes.

27394 (DOE/NV/10845–18) **A study of the homogenization of soils.** Giovine, L.R.S.; Miller, F.L. Jr. Nevada Univ., Las Vegas, NV (United States). Water Resources Center. Jun 1993. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE93017132. Source: OSTI; NTIS; GPO Dep.

In accordance with US Environmental Protection Agency (US EPA) regulations, areas of land that have been contaminated must be returned to an environmental condition that permits less restrictive forms of use. In anticipation of being listed as an EPA Superfund Site, the United States Department of Energy's (US DOE) Nevada Test Site (NTS) is evaluating existing the technologies, and supporting the development of new technologies, for the removal of plutonium contaminants from soils. During the 1950s, DOE conducted a series of tests on the NTS wherein attempts were made to detonate nuclear weapons by igniting charges of high explosives packed around the weapons' warheads. While the warheads never achieved criticality, each test disseminated particulate plutonium over several square miles, principally in Area 11 of the NTS.DOE's Nevada Operations Office has committed to a Plutonium In Soils Integrated Demonstration Project (PuID) to evaluate existing and developmental technologies for the safe removal of plutonium contamination from soils. It is DOE's intention to provide approximately one ton of Area 11 soil, traced with a non-radioactive plutonium surrogate, to each of several companies with expertise in the removal of soil contaminants. These companies have expressed an interest in contracting with DOE for remediation of NTS soils. DOE wishes to evaluate each company's process in an unbiased and statistically justifiable manner. For this reason, DOE must provide to each company a large sample of soil for prototype testing. The soil must be homogenized such that the representativeness of each split is well documented and defensible. The process of uniformly mixing large volumes of soil has not been addressed, to our knowledge, in the hydrogeologic, soil science or mining literature. Several mixing devices are currently being evaluated by DOE for use in the PuID. This report describes the results of some initial experimentation with a small cement mixer.

27395 (DOE/NV/10845–T17) **Archaeological investigations at sample unit U19ax, Nevada Test Site, Nye County, Nevada.** Beck, C.M.; Johnson, W.G.; McArthur, R.D. (eds.); Drollinger, H.; McLane, A.R.; Nowack, C.; Pippin, L.C. Nevada Univ., Reno, NV (United States). Quaternary Sciences Center. 1992. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE93015947. Source: OSTI; NTIS; GPO Dep.

This report documents the procedures and findings of archaeological investigations sample unit U19ax on Pahute Mesa, Nevada Test Site. Data recovery was conducted at sites 26NY4182, 26NY5428, 26NY7842, and 26NY7843. The investigation consisted of mapping and surface collection. Four surface artifact concentrations were defined, three it site 26NY4182 and one at site 26NY7843. Only chipped-stone and groundstone artifacts were recovered. Lithic technology at these locales was perceived to be primarily core reduction and biface thinning, possibly of intermediate stage biface production. The time frame for occupancy of the

area ranges from Early Archaic to Historic based on temporally diagnostic artifacts and radiocarbon dates. The greatest intensity of occupation seems to be around the late Middle Archaic and the early Late Archaic. The test excavation at site 26NY5428 revealed significant cultural deposits that can contribute to the research objectives of the Long Range Study Plan for the archaeological work on Pahute Mesa. The site possesses stratified deposits and datable material. Radiocarbon dates place the site in the Middle and Late Archaic periods. Based on data from the test excavation, site 26NY5428 may be viewed as the primary locus of settlement and subsistence strategies within the immediate area. Due to large pieces of rockfall covering portions of the site, full-scale excavations are not possible at this time. Full-scale excavation of site 26NY5428 is recommended if no comparable site is found in other sample units.

27396 (DOE/NV/10845–T18) **Archaeological data recovery at drill hole U19az, Nevada Test Site, Nye County, Nevada.** Lancaster, J. Nevada Univ., Reno, NV (United States). Quaternary Sciences Center. 1992. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE93015948. Source: OSTI; NTIS; GPO Dep.

At the request of the Department of Energy, Nevada Field Office (DOE/NV), the Desert Research Institute (DRI) conducted archaeological data recovery at drill hole U19az on the Nevada Test Site in February 1988 and April 1990. The work focused on a site that was recommended as eligible to the National Register of Historic Places. DOE/NV chose to mitigate adverse impacts to the site though a data recovery program. The mapping and collection of artifacts took place in two discrete areas, covering almost 10 hectares (24.71 acres). In addition to surface collection, 11 test pits and 12 surface scrapes were excavated. Information was sought to address four research questions concerned with the age of the site, the subsistence and demography of the site's inhabitants, and the behavioral implications of their lithic technology. This report describes and presents the results of the data recovery at drill hole U19az. The analyses of the artifacts indicate that the site was inhabited between 5,000 years ago and historic times. Relative artifact abundance indicates the most intense use occurred from about 4,000 to 1,500 years ago.

27397 (DOE/NV/10845–T19) **Fire on the mesa: Archaeological investigations at the U19an borrow pit on the Nevada Test Site.** Amick, D.S. Nevada Univ., Reno, NV (United States). Quaternary Sciences Center. Dec 1992. 118p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE93015949. Source: OSTI; NTIS; GPO Dep.

In 1984, the Desert Research Institute conducted an archaeological reconnaissance of a proposed borrow pit area known as U19an(bp) on the Nevada Test Site for the Department of Energy, Nevada Field Office. During this reconnaissance, four National Register quality archaeological sites were discovered and recorded as lithic scatter sites 26NY4201-4204. The DRI proposed that these sites should be avoided, or investigated if avoidance was not feasible. Analysis of the surface assemblages from U19an(bp) indicates that this area was used repeatedly over the past several thousand years for domestic activities, resource processing, and hunting. Dispersed lithic reduction stations are also scattered across the area. This report presents findings relevant to several issues that have not been considered in detail in previous archaeological studies of the NTS. Notably, a detailed discussion of the lithic reduction system utilized in the production of chalcedony bifaces is presented. In addition, the role of thermal alteration in local lithic technology is considered and the evidence for thermally fractured artifacts is investigated. The data recovered from U19an(bp) indicate that fire may have played a significant role in local site formation.

27398 (DOE/OR–01-1136) **Annual report on the Background Soil Characterization Project on the Oak Ridge Reservation, Oak Ridge, Tennessee: Results of Phase 1 investigation.** Watkins, D.R. (Oak Ridge National Lab., TN (United States)); Goddard, P.L.; Hatmaker, T.L.; Hook, L.A.; Jackson, B.L.; Kimbrough, C.W.; Lee, S.Y.; Lietzke, D.A.; McGin, C.W.; Nourse, B.D.; Schmoyer, R.L.; Shaw, R.A.; Stinnette, S.E.; Switek, J.; Wright, J.Oak Ridge National Lab., TN (United States). May 1993. 445p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ES/ER/TM–43). Order Number DE93014394. Source: OSTI; NTIS; INIS; GPO Dep.

Many constituents of potential concern for human health occur naturally at low concentrations in undisturbed soils. The Background soil Characterization Project (BSCP) was undertaken to provide background concentration data on potential contaminants in natural soils on the Oak Ridge Reservation (ORR). The objectives of the BSCP are to provide baseline data for contaminated site assessment and estimates of potential human health risk associated with background concentrations of hazardous and other constituents in native soils. This report presents, evaluates, and documents data and results obtained in Phase I of the project. It is intended to be a stand-alone document for application and use in structuring and conducting remedial investigation and remedial action projects in the Environmental Restoration (ER) Program.

27399 (DOE/SR/15191–5) **Wildlife management assistance report: Progress report, July 1, 1991–June 30, 1992.** Caudell, M.B. South Carolina Wildlife and Marine Resources Dept., Columbia, SC (United States). May 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-87SR15191. Order Number DE93015565. Source: OSTI; NTIS; GPO Dep.

Thirty-four days were spent administering hunts on Crackerneck Wildlife Management Area with 1773 people participating. Biological data was collected on 76 deer, eight wild turkeys, 33 feral hogs, 58 ducks of two species, 75 gray squirrels, 4 raccoons, 9 bobwhites, and 484 fish of 9 species. Serving as a Coordinating Land User for the SRS Site Use Committee entailed evaluating 81 land use proposals with regard to effects on wildlife populations. The antlerless deer quota program continued in the district with 129 landowners in Aiken, Barnwell, and Orangeburg Counties being approved for antlerless harvest which required field investigations, acreage verification at tax offices, and personal correspondence. Bait sites for turkey trapping were maintained on the SRS for two months. Wildlife census work was conducted on wild turkey, bobwhite, mourning dove, furbearers, fox squirrels, and bald eagles on the SRS and in Aiken and Barnwell Counties. Three wetlands in Aiken County were evaluated for suitability with regard to wood duck boxes. Two wetland environmental review notices for the SRS were evaluated. Additional work on Wildlife Management Area land included reposting 50 miles of boundary in Aiken and Lexington County and removing signs form several tracts lost from the program. Future recommendations for the turkey and regulations brochures were submitted and WMA maps covering Aiken and Lexington Counties were updated.

27400 (EGG–10617-1242) **An aerial radiological survey of the Ames Laboratory and surrounding area, Ames, Iowa: Date of survey: July 1991.** Maurer, R.J. EG and G Energy Measurements, Inc., Las Vegas, NV (United States). Remote Sensing Lab. Apr 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-93NV11265. Order Number DE93016140. Source: OSTI; NTIS; INIS; GPO Dep.

An aerial radiological survey of the Ames Laboratory and surrounding area in Ames, Iowa, was conducted during the period July 15–25, 1991. The purpose of the survey was to measure and document the terrestrial radiological environment at the Ames Laboratory and the surrounding area for use in effective environmental management and emergency response planning. The aerial survey was flown at an altitude of 200 feet (61 meters) along a series of parallel lines 350 feet (107 meters) apart. The survey encompassed an area of 36 square miles (93 square kilometers) and included the city of Ames, Iowa, and the Iowa State University. The results are reported as exposure rates at 1 meter above ground level (inferred from the aerial data) in the form of a gamma radiation contour map. Typical background exposure rates were found to vary from 7 to 9 microroentgens per hour (μR/h). No anomalous radiation levels were detected at the Ames Laboratory. However, one anomalous radiation source was detected at an industrial storage yard in the city of Ames. In support of the aerial survey, ground-based exposure rate and soil sample measurements were obtained at several sites within the survey perimeter. The results of the aerial and ground-based measurements were found to agree within the expected uncertainty of $\pm$15%.

27401 (EGG-EEL–10498) **A modeling study of contaminant transport resulting from flooding of Pit 9 at the Radioactive Waste Management Complex, Idaho National Engineering Laboratory.** Magnuson, S.O.; Sondrup, A.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1992. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93016668. Source: OSTI; NTIS; INIS; GPO Dep.

A simulation study was conducted to determine if dissolved-phase transport due to flooding is a viable mechanism for explaining the presence of radionuclides in sedimentary interbeds below the Radioactive Waste Management Complex. In particular, the study focused on ^{241}Am migration due to flooding of Pit 9 in 1969. A kinetically-controlled source term model was used to estimate the mass of ^{241}Am that leached as a function of a variable surface infiltration rate. This mass release rate was then used in a numerical simulation of unsaturated flow and transport to estimate the advance due to flooding of the ^{241}Am front down towards the 110 ft interbed. The simulation included the effect of fractures by superimposing them onto elements that represented the basalt matrix. For the base case, hydraulic and transport parameters were assigned using the best available data. The advance of the ^{241}Am front due to flooding for this case was minimal, on the order of a few meters. This was due to the strong tendency for ^{241}Am to sorb onto both basalts and sediments. In addition to the base case simulation, a parametric sensitivity study was conducted which tested the effect of sorption in the fractures, in the kinetic source term, and in the basalt matrix. Of these, the only case which resulted in significant transport was when there was no sorption in the basalt matrix. The indication being that other processes such as transport by radiocolloids or organic complexation may have contributed. However, caution is advised in interpreting these results due to approximations in the numerical method that was used incorporate fractures into the simulation. The approximations are a result of fracture apertures being significantly smaller than the elements over which they are superimposed. The sensitivity of the ^{241}Am advance to the assumed hydraulic conductivity for the fractures was also tested.

27402 (EGG-EELS–10666) **Software quality assurance plan for PORFLOW-3D.** Maheras, S.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). Mar 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012331. Source: OSTI; INIS; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020; GPO Dep.

This plan describes the steps taken by the Idaho National Engineering Laboratory Subsurface and Environmental Modeling Unit personnel to implement software quality assurance procedures for the PORFLOW-3D computer code. PORFLOW-3D was used to conduct radiological performance assessments at the Savannah River Site. software quality assurance procedures for PORFLOW-3D include software acquisition, installation, testing, operation, maintenance, and retirement. Configuration control and quality assurance procedures are also included or referenced in this plan.

27403 (EGG-M–92586) **A new probe for in situ TDR moisture measurement.** Yokuda, E. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Smith, R. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930561–5: 39. international instrumentation symposium, Albuquerque, NM (United States), 2-6 May 1993). Order Number DE93013681. Source: OSTI; NTIS; INIS; GPO Dep.

This paper explains the development of a new Time Domain Reflectometry (TDR) probe which can be inserted through waste and soil to a depth of 14 feet with minimal labor and minimal soil disturbance. TDR has been used for 10 years as a method for measuring soil moisture contents. Conventional TDR probes are 30 centimeters long and therefore are difficult to insert at depths below a few feet. Recently, a probe has been developed which can be inserted to depths of 14 feet with the use of a vibratory drill. Quality objectives for the instrument, preliminary data, and suggestions for future developments are presented.

27404 (EMO–1096-Vol.2) **Shemya AFB, Alaska 1992 IRP field investigation report: Volume 2, Appendix A: Final report.** Pacific Northwest Lab., Richland, WA (United States). Environmental Management Operations; Air Force Alaskan Air Command, Elmendorf AFB, AK (United States); CH2M Hill, Boise, ID (United States). Feb 1993. 673p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. DEU-91-06. Order Number DE93011969. Source: OSTI; NTIS; INIS; GPO Dep.

The US Air Force is currently investigating 22 sites on Shemya Air Force Base (AFB) to determine if past spill and disposal activities have caused environmental damage. These investigations are being carried out under the Air Force's Installation Restoration Program (IRP). Field investigations were performed in 1992 to obtain the information needed to assess what future actions will need to be carried out at each site. The island's drinking water supply was also investigated. Activities completed at 10 selected sites during the 1992 field investigation included surface sampling to determine the lateral extent of contamination, subsurface sampling to determine the vertical extent of contamination, and the installation of well points and monitoring wells to determine the direction of groundwater flow and if the groundwater has been affected by a site. In addition, geophysical surveys were performed at most sites to identify site boundaries and check for the presence of buried metal to be avoided during drilling activities. This report, appendix A, contains the analytical results.

27405 (ENEA-RT-AMB–92-16) **Environmental radioactivity measurements around ENEA's Brasimone center.** Cazzoli, S.; Lorenzelli, R.; Salvi, S. ENEA, Bologna (Italy). Area Energia Ambiente e Salute. Jun 1992. 28p. (In Italian). (RT/AMB–92-16). Order Number DE93799294. Source: OSTI; NTIS (US Sales Only); INIS.

This paper reports the values of the 1987 radioactivity analysis on environmental and food chain matrixes, in the area of the Brasimone Centre (Bologna). Descriptions are also given of the collecting, treating and testing methods for various matrixes analysed. This ENEA (Italian Agency for Energy, New Technologies and Environment) nuclear lab complex was intended to serve the nearby PEC nuclear power station whose completion has been developed due to the Italian moratorium on nuclear power.

27406 (ESH-EMS–920037) **The Savannah River Site's Groundwater Monitoring Program: Third quarter 1992.** Rogers, C.D. (Westinghouse Savannah River Co., Aiken, SC (United States)). Westinghouse Savannah River Co., Aiken, SC (United States); Exploration Resources, Inc., Athens, GA (United States). 4 Feb 1993. 876p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93015366. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Protection Department/Environmental Monitoring Section (EPD/EMS) administers the Savannah River Site's (SRS) Groundwater Monitoring Program. During third quarter 1992, EPD/EMS conducted extensive sampling of monitoring wells. Table 1 lists those well series with constituents in the groundwater above Flag 2 during third quarter 1992, organized by location. Results from all laboratory analyses are used to generate this table. Specific conductance and pH data from the field also are included in this table.

27407 (ETDE-IT–93-175) **Evaluation of trace and minor elements in agricultural products from Italian farms, by instrumental neutron activation analysis.** Moauro, A.; Triolo, L.; Avino, P.; Ferrandi, L. ENEA, Casaccia (Italy). Area Energia e Innovazione. 1992. 8p. (CONF-9209369–1: 8. international colloquium for the optimization of plant nutrition, Lisbon (Portugal), 1-5 Sep 1992). Order Number DE93799194. Source: OSTI; NTIS (US Sales Only).

Instrumental neutron activation analysis (INAA) was used to determine non- destructively as many as 25 minor and trace elements in some crops collected from Italian farms, in different pollution conditions. For quantitative evaluations, some reference materials were used, prepared by a group of 38 Analytical Institutes (CII) and analyzed in an inter-comparison campaign. No large differences were found among the examined areas, but a comparison among our values, and those recommended or considered provisionally safe by WHO, showed that our data for Cr, Co and

Cu exceeded these limits. The largest values were found for tobacco leaves collected in an agricultural area of central Italy.

27408 (GTK-YST–81) **Mise-a-la-Masse measurements and galvanic connections as a part of flow path investigations at Palmottu U-Th-mineralization, southwestern Finland.** Paananen, M. Geological Survey of Finland, Espoo (Finland). 1993. [37p.] (In Finnish). Order Number DE93629306. Source: OSTI; NTIS; INIS.

Nuclear Waste Disposal Research.

The Palmottu U-Th-mineralization at Nummi-Pusula, southwestern Finland has been the subject of natural analogue studies for radionuclide migration since 1987. The mobilization, migration and sorption phenomena of radionuclides in crystalline bedrock in the area have been investigated. In the work, the galvanic and possible hydraulic connections between drill holes are studied by the charged potential-method (mise-a-la-masse), in which a current source is grounded at an interesting structure in a drill hole and the potential is sounded in another drill hole in the vicinity of the grounding. A galvanic connection to the current source can possibly seen as a potential maxima. The measurements have mostly been carried out in two drilling profiles in ten drill holes with fifteen current grounding positions. A total of 35 separate potential soundings were carried out. Possibly hydraulically significant sections (intense fracturing, low resistivity) were chosen as grounding positions. Fracture zones that possibly cut the mineralization were of special interest.

27409 (HW–18321) **A rapid, simple method for the determination of the radon content of water.** Thorburn, R.C.; Healy, J.W. Hanford Works, Richland, WA (United States). 29 Jun 1950. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93017358. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The historical approach to the separation of radon from water is liberation of the radon from the sample by boiling under vacuum in the presence of a strong acid; flushing the liberated radon, with an inert gas, into an ionization chamber or an alpha proportional counters and measuring the collected activity. Such an analysis requires a manipulation time of approximately one hour, a waiting period of two to three hours before measurement to allow transitory equilibrium to be reached, and finally a measurement time, resulting in 4 to 6 hours for one analysis. In addition, specialized equipment including a vacuum train is required. If it is desired to count the alpha particles from radon and its daughters in a proportional counter, absorption trains to remove all oxygen, a poor counting gas, are required. The method presented herein requires only 20–25 minutes for a complete analysis and except for the beta counter utilizes standard laboratory equipment.

27410 (INIS-mf–12758, pp. 704-709) **Radionuclides sorption in clay soils.** Siraky, G. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Seguridad Radiologica y Nuclear); Lewis, C.; Hamlat, S.; Nollmann, C.E. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The sorption behaviour of clay soils is examined through a parametric study of the distribution coefficient (Kd) for the radionuclides of interest, Cs and Sr. This work is a preliminary stage of the migration studies of these nuclides in a porous medium (ground of Ezeiza, Argentina) and the evaluation of radiologic impact of the removal of low and intermediate activity wastes in shallow trenches. The determination of Kd is performed by a static technique or batch. The phases are separated by centrifugation at 20000 g during 1 hour. The activity of supernatant solution of Cs-137 and Sr-85 is measured in a detecting system of I Na(Tl) well-type. Two types of parameters were changed: (a) those related to the determination method: phase separation (centrifugation vs. centrifugation plus filtration); equilibrium period, ratio solid/liquid; (b) those related to the geochemical system: pH of contact solution, carrier concentration, competitive ions, ionic strength, desorption. It was observed that the modification of parameters in the Kd-measurement does not change the order of magnitude of results. (Author).

The publication includes abstracts of the geological researches.

27426 (INIS-mf–13542) **Soil transfer function obtention by Wiener's optimum filter.** Flores Ruiz, J.H. Instituto Nacional de Investigaciones Nucleares, Mexico City (Mexico). 1987. [17p.] (In Spanish). (CONF-8706430–: 3. Seminarium EII, MPI, NINI on Technological Specialities., Salazar (Mexico), 11 Jun 1987). Order Number DE93629307. Source: OSTI; NTIS (US Sales Only); INIS.
Transfer function in nuclear power plant Laguna Verde, Veracruz, using Wiener filter. This paper deal with identification of complex structural and soil-interaction systems often are modeling in nuclear industry. Nonparametric identification techniques are used to analyse the response of a class nonlinear vibrations. Efficient computational algorithms and experimental techniques based input-output system methods such as the Wiener-Kernel approach and least-square regression techniques are applied to get the transfer function in nuclear power plant Laguna Verde, Veracruz (Mexico) (Author).

27427 (INIS-mf–13543, pp. 14-22) **Radioactivity of rocks.** Matolin, M. (Karlova Univ., Prague (Czech Republic). Prirodovedecka Fakulta). Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.
Radioactive isotopes of uranium, thorium and potassium are major sources of the Earth's radiation. The average concentrations of the three elements in the Earth's crust are 2-4 ppm, 8-12 ppm, and 2.5%, respectively. Field measurements of radioactivity of rocks, which are mainly concerned with the detection of gamma rays, are performed from airplanes or cars, manually, in bores and by analyzing rock samples. The radioactivity of various rock massifs in the Czech and in the Slovak Republic is given. The gamma dose rate in air in the Bohemian Massif region is about 70 nGy/h, in the West Carpathians region, 50 nGy/h. (M.D.) 2 tabs., 1 fig.

27428 (INIS-mf–13543, pp. 161-180) **Specific activities of natural radionuclides in building materials.** Kominek, A. (Vyzkumny Ustav Stavebnich Hmot, Brno (Czech Republic)); Breda, M.; Thomas, J. Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.
A brief survey of papers dealing with natural radioactivity and radon is presented, and an overview of institutions concerned with this subject is given. The existing results of measurement of specific activities of natural radionuclides in building raw materials are summarized. An extensive table of specific activities of building materials is reproduced, as is a table of emanation coefficients of building materials. A survey of binding and recommended values, limits, standards and regulations is also given. (M.D.). Tabs.

27429 (KCP–613-5152) **Process waste assessment: Petroleum jelly removal from semiconductor die using trichloroethylene.** Curtin, D.P. Allied-Signal Aerospace Co.,

Kansas City, MO (United States). Kansas City Div. May 1993. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE93015596. Source: OSTI; NTIS; INIS; GPO Dep.

The process analyzed involves non-production, laboratory environment use of trichloroethylene for the cleaning of semiconductor devices. The option selection centered on the replacement of the trichloroethylene with a non-hazardous material. This process waste assessment was performed as part of a pilot project.

27430 (LA-UR–93-2326) **The importance of zeolites in the potential high-level radioactive waste repository at Yucca Mountain, Nevada.** Vaniman, D.T.; Bish, D.L. Los Alamos National Lab., NM (United States). 1993. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9306100–2: Zeolite 93: 4th international conference on the occurrence, properties, and utilization of natural zeolites, Boise, ID (United States), 20-28 Jun 1993). Order Number DE93016459. Source: OSTI; NTIS; GPO Dep.

Zeolitic rocks play an important role in retarding the migration of radionuclides that occur in solution as simple cations (Cs, Sr, Ba). However, the interaction of zeolites with complex transuranic species in solution provides little if any advantage over other common silicate minerals. The most important consequences of zeolite occurrences near a high-level radioactive waste repository environment are likely to be their response to thermal loading and their impact on site hydrology. Partial zeolite dehydration during the early thermal pulse from the repository and rehydration as the repository slowly cools can have an important impact on the water budget of a repository in unsaturated rocks, provided that the long-term heating does not result in zeolite destabilization.

27431 (LBL–32418) **Analysis of flow processes during TCE infiltration in heterogeneous soils at the Savannah River Site, Aiken, South Carolina.** Pruess, K. Lawrence Berkeley Lab., CA (United States). Jun 1992. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015266. Source: OSTI; NTIS; GPO Dep.

Contamination of soils and groundwater from volatile organic compounds (VOCs), such as organic solvents and hydrocarbon fuels, is a problem at many industrial facilities. Key to successfully characterizing, containing, and eventually remediating the contamination is a thorough understanding, based on sound scientific principles, of the complex interplay of physical, chemical, and biological processes in geologic media, which affect the migration and distribution of the contaminants, and their response to remediation operations. This report focusses on physical mechanisms that affect contaminant behavior under the conditions encountered at the Savannah River site (SRS). Although other contaminants are present at the site, for the purpose of this discussion we will restrict ourselves to the processes following a spill and infiltration of trichloroethylene (TCE), which is the main contaminant at the location of the Integrated Demonstration Project. We begin by briefly describing the main physical processes following release of TCE into the subsurface. Subsequently we will present simple engineering models that can help to evaluate contaminant migration processes in a semi-quantitative way. Finally, we will discuss results of detailed numerical simulations of TCE infiltration into a heterogeneous medium consisting of sands and clays. These simulations attempt to shed light on the initial distribution of contaminants at the site prior to the start of remediation operations. We also point out limitations of present numerical modeling capabilities, and identify issues that require further research in order that a realistic description of contaminant behavior in the subsurface may be achieved.

27432 (LBL–33957) **Applicability of petroleum horizontal drilling technology to hazardous waste site characterization and remediation.** Goranson, C. Lawrence Berkeley Lab., CA (United States). Sep 1992. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015270. Source: OSTI; NTIS; INIS; GPO Dep.

Horizontal wells have the potential to become an important tool for use in characterization, remediation and monitoring operations at hazardous waste disposal, chemical manufacturing, refining and other sites where subsurface pollution may develop from operations or spills. Subsurface pollution of groundwater aquifers can occur at these sites by leakage of surface disposal ponds, surface storage tanks, underground storage tanks (UST), subsurface pipelines or leakage from surface operations. Characterization and remediation of aquifers at or near these sites requires drilling operations that are typically shallow, less than 500-feet in depth. Due to the shallow nature of polluted aquifers, waste site subsurface geologic formations frequently consist of unconsolidated materials. Fractured, jointed and/or layered high compressive strength formations or compacted caliche type formations can also be encountered. Some formations are unsaturated and have pore spaces that are only partially filled with water. Completely saturated underpressured aquifers may be encountered in areas where the static ground water levels are well below the ground surface. Each of these subsurface conditions can complicate the drilling and completion of wells needed for monitoring, characterization and remediation activities. This report describes some of the equipment that is available from petroleum drilling operations that has direct application to groundwater characterization and remediation activities. A brief discussion of petroleum directional and horizontal well drilling methodologies is given to allow the reader to gain an understanding of the equipment needed to drill and complete horizontal wells. Equipment used in river crossing drilling technology is also discussed. The final portion of this report is a description of the drilling equipment available and how it can be applied to groundwater characterization and remediation activities.

27433 (NUREG–0837-Vol.13-No.1) **NRC TLD Direct Radiation Monitoring Network: Progress report, January–March 1993: Volume 13, No. 1.** Struckmeyer, R.; McNamara, N. Nuclear Regulatory Commission, King of Prussia, PA (United States). Region I. May 1993. 228p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

This report provides the status and results of the NRC Thermoluminescent Dosimeter (TLD) Direct Radiation Monitoring Network. It presents measured in the vicinity of NRC licensed facilities throughout the country for the first quarter of 1993.

27434 (NUREG/CR–5996) **Subsurface injection of radioactive tracers: Field experiment for model validation testing.** Fayer, M.J. (Pacific Northwest Lab., Richland, WA (United States)); Sisson, J.B.; Jordan, W.A.; Lu, A.H.; Heller, P.R. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 48p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC06-76RL01830. (PNL–8499). Source: OSTI; NTIS; INIS; GPO.

Accurate predictions of the movement of radioactive contaminants from disposal facilities are required to evaluate effects, optimize data collection, design remediation strategies and predict the long-term results of such strategies. A field experiment was undertaken in 1980 and 1981 to provide data to test the limits of model predictions. The purpose of this report is to provide a complete record of data generated during that field experiment for use as a model validation test case. The report combines the information in Sisson and Lu (1984) with unpublished laboratory and field data on the hydraulic properties of the sediments and core data collected at the end of the experiment The unique features of this experiment were the documented control of the inputs, the three-dimensional nature of the experiment, the measurement of radioactive tracers in situ, and the use of multiple injections. The in situ monitoring methods were neutron moderation for water content and gamma energy analysis for tracer concentration. The data are provided on 3.5-in. diskettes. The data include observation and injection well construction details, injection solution concentrations, radioactive tracer and water content distributions in space and time, neutron probe calibration information, and sediment properties determined in both the laboratory and field.

27435 (NUREG/CR–6041) **Disposal Unit Source Term (DUST) data input guide.** Sullivan, T.M. (Brookhaven National Lab., Upton, NY (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Low-Level Waste Management and Decommissioning; Brookhaven National Lab., Upton, NY

(United States). May 1993. 197p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (BNL-NUREG–52375). Source: OSTI; NTIS; INIS; GPO.

Performance assessment of a low-level waste (LLW) disposal facility begins with an estimation of the rate at which radionuclides migrate out of the facility (i.e., the source term). The focus of this work is to develop a methodology for calculating the source term. In general, the source term is influenced by the radionuclide inventory, the wasteforms and containers used to dispose of the inventory, and the physical processes that lead to release from the facility (fluid flow, container degradation, wasteform leaching, and radionuclide transport). The computer code DUST (Disposal Unit Source Term) has been developed to model these processes. This document presents the models used to calculate release from a disposal facility, verification of the model, and instructions on the use of the DUST code. In addition to DUST, a preprocessor, DUSTIN, which helps the code user create input decks for DUST and a post-processor, GRAFXT, which takes selected output files and plots them on the computer terminal have been written. Use of these codes is also described.

27436 (OEFZS–4620) **The lysimeter device of the Austrian Research Centre Seibersdorf.** Gerzabek, M.H. (Hauptabteilung Agrarforschung und Biotechnologie, Forschungszentrum Seibersdorf GmbH, Seibersdorf (Austria)). Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Mar 1992. 'Radiation monitoring' is understood to comprise all activities leading to the prompt quantitative and qualitative comprehension and evaluation of locally limited contamination situations due to diverse causes. The results of 'radiation monitoring' form the basis for the establishment of the kind and scope of protective measures to be taken on behalf of the persons concerned or the population in general. Generally, areas easily accessible by car or by foot, as well as urban areas, should be rather monitored by ground survey, while remote areas hardly accessible by car or by foot should by monitored from the air. Monitoring procedures and monitoring methods preferred for a certain area in the case of emergency should already now be defined in emergency plans. To assure the quick and easy availability of staff and of the required equipment and vehicles, as well as their precise and rational employment, the training and practice activities have to be designed according to these plans. A up-to-date digital communication and evaluation system would be of advantage. (author).

27438 (OEFZS–4666) **The soil-to-plant transfer of radionuclides. Feasibilities and limits of the transfer concept.** Gerzabek, M.H. (Hauptabteilung Agrarforschung und Biotechnologie, Forschungszentrum Seibersdorf GmbH, Seibersdorf (Austria)). Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Jan 1993. [22p.] (In German). Order Number DE93628021. Source: OSTI; NTIS (US Sales Only); INIS.

Provided with ISSN 0253-5270.

The present paper discusses the simple transfer model. After the Chernobyl fallout in Austria field investigations dealt with the behavior of radionuclides in the soil-plant system. They led to the following conclusions: (1) A single plowing does not result in a homogeneous radionuclide distribution in the A_p horizon. (2) Low plant availability of radionuclides (e.g. ^{137}Cs) led to a higher contribution of outer contamination (resuspension) to concentrations in plants in the first years after the fallout. Differences arose between high and low contamination areas. This was not true for ^{90}Sr, which exhibited three to ten times higher transfer factors as compared to ^{137}Cs. (3) The contamination source has a distinct impact on the plant availability of radionuclides. (4) In semi-natural environments radiocesium can be bound to the biomass to a great extent, which results in significantly higher biological half-lives as compared to agricultural ecosystems. (author).

27439 (ORNL/FTR–4369) **Travel to the Netherlands to participate in a workshop held by the World Inventory of Soil Emissions (WISE) project at the International Soil Reference and Information Centre (ISRIC): Foreign trip report, August 22–29, 1992.** Post, W.M. Oak Ridge National Lab., TN (United States). 14 Sep 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012246. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The concentrations of so-called "greenhouse gases" are increasing in the atmosphere. The conditions and processes that regulate the emission of the natural trace gases from terrestrial ecosystems are not fully understood. The World Inventory of Soil Emissions (WISE) Project, funded by the Netherlands National Research Programme on Global Air Pollution and Climate Change, is developing a computerized soil data base with spatial resolution of $\frac{1}{2}$ by $\frac{1}{2}$ degree to contain soil information necessary for estimating soil carbon dynamics, terrestrial ecosystem carbon dynamics, and emissions of the trace gases CO_2, NH_4 and N_2O. The traveler was an invited participant in a workshop that assembled leading investigators in soil research and global change that developed an appropriate methodology for assembling data and models to complete the WISE Project objectives. Successful completion of the WISE Project will result in an important resource for global carbon cycle research sponsored by DOE at ORNL and for the international scientific community.

27440 (ORNL/FTR–4413) **Travel to the United Kingdom and Italy to present keynote lectures and technical talks at two international meetings on the role of natural organic matter in the environment and to learn about recent advances in this area relevant to the traveler's research: Foreign trip report, September 10–26, 1992.** McCarthy, J.F. Oak Ridge National Lab., TN (United States). 2 Oct 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011664. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler presented keynote lectures and technical presentations at the International Conference on Organic Substances in Soil and Water and the Sixth International Humic Substances Society (IHSS) Meeting. At the Organic Substances Conference, the traveler presented a keynote lecture entitled "Subsurface Transport of Dissolved Organic Matter: Implications for Contaminant Mobility" and a technical presentation on humic acids as mass fractals. At the IHSS meeting, the traveler presented a keynote lecture entitled "The Significance of Interactions of Humic Acids and Organisms in the Environment" and two poster presentations on field studies on organic matter. Other presentations of interest to the traveler are described, including studies of cotransport of contaminants in soil, advances in characterization of natural organic matter (NOM), and interactions of NOM with colloid and aquifer surfaces.

27441 (ORNL/FTR–4426) **[Rothamsted model for turnover of soil organic matter]: Foreign trip report, October 7–9, 1992.** Post, W.M. Oak Ridge National Lab., TN (United States). 26 Oct 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009931. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler gave an invited presentation at the Global Soil Database Workshop in Silsoe detailing a soil organic matter data base assembled over 10 years ago as a collaborative project between ORNL and University of California, Berkeley. The scientific communities addressing issues in global biogeochemical cycles, including trace gas exchange and effects of the land surface water and energy balance on climate, require global maps of soil properties. The current global data bases are inadequate for defining

properties such as texture and organic matter content. The workshop outlined a new global soils data base that focuses on soil properties and not on soil classification. Such a map will make the quality of soils information more uniform and hence more useful for global modeling.

27442 (ORNL/FTR–4452) **Monitoring and evaluation of the Guatemalan Mission's natural resources strategic objective: Foreign trip report, September 13–30, 1992.** Shonder, J.A. Oak Ridge National Lab., TN (United States). 26 Oct 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009942. Source: OSTI; NTIS (US Sales Only); GPO Dep.

At the request of the Guatemalan Mission of the US Agency for International Development, the traveler went to Guatemala City to assist in the development of a plan for monitoring and evaluation of the Mission's natural resources strategic objective. The activity, which was carried out over a two and one-half week period, involved review of documentation for projects managed under the strategic objective, discussions with program managers, preparation of a draft document outlining the monitoring and evaluation plan, and a final oral presentation of the draft plan. A trip was made to Flores, Guatemala to determine the availability of photographs which will be used to document deforestation trends in the Department of Peten, Guatemala.

27443 (ORNL/FTR–4455) **Environmental contamination in Central and Eastern Europe: Foreign trip report, October 10–17, 1992.** Haas, J.W. III. Oak Ridge National Lab., TN (United States). 3 Nov 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009936. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Papers were presented at the symposium describing advances in environmental monitoring developed by the Measurement Systems Research Group at Oak Ridge National Laboratory. Plenary sessions describing the state of the environment in Eastern Europe and technical sessions on sampling and monitoring methods, site characterization, field screening and remote sensing methods, site remediation, control technologies, analytical methods, and radiological contamination were attended.

27444 (ORNL/FTR–4510) **[Environmental impact analyses on current and planned Antarctic operations and research activities]: Foreign trip report, October 19–November 20, 1992.** McCold, L.N.; Ensminger, J.T. Oak Ridge National Lab., TN (United States). 17 Dec 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009784. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Lance N. McCold and J. Tim Ensminger travelled to Antarctica at the request of the National Science Foundation for the purpose of gaining first hand knowledge of the major environmental issues related to the US antarctic research activities and support operations. The NSF's activities were evaluated under the requirements of the Madrid Protocol that Antarctica be protected for its own intrinsic value and its unique usefulness for future scientific research. Several activities in the vicinity of McMurdo Station and the South Pole Station were identified as potentially requiring environmental impact analyses.

27445 (ORNL/FTR–4552) **[Travel to US field stations in Antarctica in preparation for environmental impact studies]: Foreign trip report, January 4–February 22, 1993.** Webb, J.W.; Easterly, C.E. Oak Ridge National Lab., TN (United States). 24 Mar 1993. 14p. Sponsored by National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011815. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The travelers flew to Antarctica at the request of the National Science Foundation (NSF) for the purpose of gaining firsthand knowledge of the major environmental issues related to the US Antarctic research activities and support operations. The NSF's activities were evaluated under the requirements of the Madrid Protocol that Antarctica be protected for its own intrinsic value and its unique usefulness for future scientific research. The visit was planned to augment and extend investigations by L. N. McCold and J. T. Ensminger of ORNL undertaken in October and November 1992, respectively. Several activities in the vicinity of McMurdo Station and the South Pole Station were surveyed for possible future environmental impact analyses.

27446 (ORNL/TM–12048) **Management plan for the Oak Ridge Reservation Hydrology and Geology Study Groundwater Data Base.** Thompson, B.K. Oak Ridge National Lab., TN (United States). Apr 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93014341. Source: OSTI; NTIS; GPO Dep.

The Oak Ridge Reservation Hydrology and Geology Study (ORRHAGS) Groundwater Data Base has been compiled to consolidate groundwater data from the three US Department of Energy facilities located on the Oak Ridge Reservation: the Oak Ridge K-25 Site, the Oak Ridge National Laboratory, and the Oak Ridge Y-12 Plant. Each of these facilities maintains its own groundwater and well construction data bases. Data were extracted from the existing data bases, converted to a consistent format, and integrated into the ORRHAGS Groundwater Data Base structures. This data base management plan documents the development and maintenance of the ORRHAGS Groundwater Data Base and contains information on data base objectives; roles and responsibilities of the personnel involved; and flow, updating, and storage of the data.

27447 (ORNL/TM–12142) **Comparison of three field screening techniques for delineating petroleum hydrocarbon plumes in groundwater at a site in the southern Carson Desert, Nevada.** Smuin, D.R. Oak Ridge National Lab., TN (United States). Jan 1993. 134p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012428. Source: OSTI; NTIS; INIS; GPO Dep.

Three types of field screening techniques used in the characterization of potentially contaminated sites at Naval Air Station Fallon, Nevada, are compared. The methods and results for each technique are presented. The three techniques include soil-gas surveys, electromagnetic geophysical surveys, and groundwater test hole screening. Initial screening at the first study site included two soil-gas surveys and electromagnetic geophysical studies. These screening methods identified l areas of contamination; however, results were inconclusive. Therefore groundwater test hole screening was performed. Groundwater screening consisted of auger drilling down to the shallow alluvial aquifer. Groundwater samples were collected from the open drill hole with a bailer. On-site head-space analyses for volatile organic compounds (VOCS) were performed using a portable gas chromatograph (GC). Five areas of floating petroleum hydrocarbon product were identified along with the overall dissolved contaminant plume boundaries. Well placement was re-evaluated, and well sites were relocated based on the screening information. The most effective technique for identification of petroleum hydrocarbon-contaminant plumes was groundwater test hole screening. Groundwater screening was subsequently performed at 19 other sites. A total of 450 test holes were analyzed resulting in the delineation of six plumes.

27448 (ORNL/TM–12177) **Selective leaching of uranium from uranium-contaminated soils: Progress report 1.** Francis, C.W.; Mattus, A.J.; Farr, L.L.; Elless, M.P.; Lee, S.Y. Oak Ridge National Lab., TN (United States). Feb 1993. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93010428. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication No. 3980.

Three soils and a sediment contaminated with uranium were used to determine the effectiveness of sodium carbonate and citric acid leaching to decontaminated or remove uranium to acceptable regulatory levels. Two of the soils were surface soils from the DOE facility formerly called the Feed Materials Production Center (FMPC) at Fernald, Ohio. This facility is presently called the Fernald Environmental Management Project (FEMP). Carbonate extractions generally removed from 70 to 90% of the uranium from the Fernald storage pad soil. Uranium was slightly more difficult to extract from the Fernald incinerator and the Y-12 landfarm soils. Very small amounts of uranium could be extracted from the storm sewer sediment. Extraction with carbonate at high solution-to-soil ratios were as effective as extractions at low solution-to-soil ratios,

indicating attrition by the paddle mixer was not significantly different than that provided in a rotary extractor. Also, pretreatments such as milling or pulverizing the soil sample did not appear to increase extraction efficiency when carbonate extractions were carried out at elevated temperatures (60°C) or long extraction times (23 h). Adding $KMnO_4$ in the carbonate extraction appeared to increase extraction efficiency from the Fernald incinerator soil but not the Fernald storage pad soil. The most effective leaching rates (> 90 % from both Fernald soils) were obtained using a citrate/dithionite extraction procedure designed to remove amorphous (noncrystalline) iron/aluminum sesquioxides from surfaces of clay minerals. Citric acid also proved to be a very good extractant for uranium.

27449 (ORNL/TM–12324) **An inventory of wells of Oak Ridge National Laboratory 1992.** Rush, R.M.; Gryder, R.K.; Baxter, F.P. Oak Ridge National Lab., TN (United States). Feb 1993. 187p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93014151. Source: OSTI; NTIS; INIS; GPO Dep.

The well inventory described in this report is a database of well information being developed for the Oak Ridge National Laboratory (ORNL) Groundwater Coordinator and the ORNL Groundwater Protection Program. Data are presented on 2071 ORNL wells as maps and as tabular data. A table of well identification aliases is given to permit correlation with earlier reports. Information is incomplete for many of the wells, and a form is provided for readers to provide missing or updated data. The goal of the developers of this data base is to produce a comprehensive inventory of wells at ORNL. This data base is being maintained to provide current information for the operational management of the ORNL groundwater monitoring system and for various users of groundwater data at ORNL.

27450 (PNL–6415-Rev.5) **Hanford Site National Environmental Policy Act (NEPA) Characterization: Revision 5.** Cushing, C.E. (ed.). Pacific Northwest Lab., Richland, WA (United States). Dec 1992. 209p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93010161. Source: OSTI; NTIS; INIS; GPO Dep.

This fifth revision of the Hanford Site National Environmental Policy (NEPA) Characterization presents current environmental data regarding the Hanford Site and its immediate environs. This information is intended for use in preparing Site-related NEPA documentation. Information is presented on climate and meteorology, geology and hydrology, ecology, history and archaeology, socioeconomics, land use, and noise levels, prepared by Pacific Northwest Laboratory (PNL) staff. Models are described that are to be used in simulating realized or potential impacts from nuclear materials at the Hanford Site. Included are models of radionuclide transport in groundwater and atmospheric pathways, and of radiation dose to populations via all known pathways from known initial conditions. Federal and state regulations, DOE orders and permits, and environmental standards directly applicable for the NEPA documents at the Hanford Site, are provided.

27451 (PNL–8334) **Cost/benefit analysis comparing ex situ treatment technologies for removing carbon tetrachloride from Hanford groundwater.** Truex, M.J.; Brown, D.R.; Elliott, D.B. Pacific Northwest Lab., Richland, WA (United States). May 1993. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93013934. Source: OSTI; NTIS; INIS; GPO Dep.

Pacific Northwest Laboratory conducted a cost/benefit and performance analysis to compare ex situ technologies that can be used to destroy the carbon tetrachloride (CCl_4) in the ground water of Hanford's 200 West Area. The objective of this work was to provide a direct quantitative and qualitative comparison of competing technologies. The technologies examined included a biological system, the Thermochemical Environmental Energy System II (TEES II), and a UV/oxidation system. The factors examined included key system operation parameters, impact on inorganic contaminants in the ground water, and secondary waste production. The cost effectiveness of these destruction technologies was also compared to the cost for an air stripping/granular activated carbon (AS/GAC) system. While the AS/GAC system appeared to be more cost effective at many levels than the CCl_4 destruction technologies, the secondary waste produced by this system may lead to significant cost and/or regulatory problems. The factors with the greatest influence on cost for each destruction technology are as follows: nutrient requirements for both of the biological systems, electricity requirements and the type of unit operations for the TEES II process, and electricity requirements for UV/oxidation.

27452 (PNL–8478) **Soil erosion rates caused by wind and saltating sand stresses in a wind tunnel.** Ligotke, M.W. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93009154. Source: OSTI; NTIS; INIS; GPO Dep.

Wind erosion tests were performed in a wind tunnel in support of the development of long-term protective barriers to cap stabilized waste sites at the Hanford Site. Controlled wind and saltating sand erosive stresses were applied to physical models of barrier surface layers to simulate worst-case eolian erosive stresses. The goal of these tests was to provide information useful to the design and evaluation of the surface layer composition of an arid-region waste site barrier concept that incorporates a deep fine-soil reservoir. A surface layer composition is needed that will form an armor resistant to eolian erosion during periods of extreme dry climatic conditions, especially when such conditions result in the elimination or reduction of vegetation by water deprivation or wildfire. Because of the life span required of Hanford waste barriers, it is important that additional work follow these wind tunnel studies. A modeling effort is planned to aid the interpretation of test results with respect to the suitability of pea gravel to protect the finite-soil reservoir during long periods of climatic stress. It is additionally recommended that wind tunnel tests be continued and field data be obtained at prototype or actual barrier sites. Results wig contribute to barrier design efforts and provide confidence in the design of long-term waste site caps for and regions.

27453 (PNL–8500-Pt.2) **Pacific Northwest Laboratory annual report for 1992 to the DOE Office of Energy Research: Part 2, Environmental sciences.** Grove, L.K. (ed.); Wildung, R.E. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 232p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93013932. Source: OSTI; NTIS; INIS; GPO Dep.

The 1992 Annual Report from Pacific Northwest Laboratory (PNL) to the US Department of Energy (DOE) describes research in environment and health conducted during fiscal year 1992. This report consists of four volumes oriented to particular segments of the PNL program, describing research performed for the DOE Office of Health and Environmental Research in the Office of Energy Research. The parts of the 1992 Annual Report are: Biomedical Sciences; Environmental Sciences; Atmospheric Sciences; and Physical Sciences. This Report is Part 2: Environmental Sciences. Included in this report are developments in Subsurface Science, Terrestrial Science, Laboratory-Directed Research and Development, Interactions with Educational Institutions, Technology Transfer, Publications, and Presentations. The research is directed toward developing a fundamental understanding of subsurface and terrestrial systems as a basis for both managing these critical resources and addressing environmental problems such as environmental restoration and global change. The Technology Transfer section of this report describes a number of examples in which fundamental research is laying the groundwork for the technology needed to resolve important environmental problems. The Interactions with Educational Institutions section of the report illustrates the results of a long-term, proactive program to make PNL facilities available for university and preuniversity education and to involve educational institutions in research programs. The areas under investigation include the effect of geochemical and physical phenomena on the diversity and function of microorganisms in deep subsurface environments, ways to address subsurface heterogeneity, and ways to determine the key biochemical and physiological pathways (and DNA markers) that control nutrient, water, and energy dynamics in arid ecosystems and the response of these systems to disturbance and climatic change.

27454 (PNL–8580) **Water level measurements for modeling hydraulic properties in the 300-FF-5 and 100 Aggregate Area Operable units.** Campbell, M.D.; McMahon, W.J.; Simpson, K.R.

Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 68p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93010929. Source: OSTI; NTIS; INIS; GPO Dep.

Pressure transducers connected to dataloggers were used to measure ground water and Columbia River water elevations simultaneously and hourly at 35 locations in the 300-FF-5 Operable Unit and 16 locations in the 100 Aggregate Area Operable Unit on the Hanford Site. Water temperatures were also measured at 12 of these locations. This report details the findings of these studies.

27455 (PNL–8654) **Columbia River monitoring: Summary of chemical monitoring along cross sections at Vernita Bridge and Richland.** Dirkes, R.L.; Patton, G.W.; Tiller, B.L. Pacific Northwest Lab., Richland, WA (United States). May 1993. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93014149. Source: OSTI; NTIS; GPO Dep.

This report presents the results of the chemical monitoring performed by the Surface Environmental Surveillance Project (SESP) along cross sections of the Columbia River established at Vernita Bridge and the Richland Pumphouse. Potential Hanford-origin chemical constituents of interest were selected based on their presence in ground water near the river, past surveillance efforts that have documented their entry into the river, and reviews of special study reports, CERCIA remedial investigation/feasibility study (RI/FS) documentation, RCRA facility investigation/corrective measure (FI/CW) study plans, and preliminary risk assessments. Results presented in this report include volatile organic compounds, metals, and anions. The data were generated as part of the routine Columbia River monitoring program currently conducted as part of the SESP.

27456 (PNL–8675) **A comparison of simulation models for predicting soil water dynamics in bare and vegetated lysimeters.** Link, S.O.; Kickert, R.N.; Fayer, M.J.; Gee, G.W. Pacific Northwest Lab., Richland, WA (United States). Jun 1993. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93016575. Source: OSTI; NTIS; GPO Dep.

This report describes the results of simulation models used to predict soil water storage dynamics at the Field Lysimeter Test Facility (FLTF) weighing lysimeters. The objectives of this research is to develop the capability to predict soil water storage dynamics with plants in support of water infiltration control studies for the Hanford Permanent Isolation Barrier Development Program. It is important to gain confidence in one's ability to simulate soil water dynamics over long time periods to assess the barrier's ability to prevent drainage. Two models were compared for their ability to simulate soil water storage dynamics with and without plants in weighing lysimeters, the soil water infiltration and movement (SWIM) and the simulation of production and utilization of rangelands (SPUR-91) models. These models adequately simulated soil water storage dynamics for the weighing lysimeters. The range of root mean square error values for the two models was 7.0 to 19.8. This compares well with the range reported by Fayer et al. (1992) for the bare soil data sets of 8.1 to 22.1. Future research will test the predictive capability of these models for longer term lysimeter data sets and for historical data sets collected in various plant community types.

27457 (PNL-SA–21614) **Fiber optic spectrochemical emission sensor: Detection of volatile chlorinated compounds in air and water using ultra-thin membranes.** Anheier, N.C. Jr.; Olsen, K.B.; Osantowski, R.E.; Evans, J.C. Jr.; Griffin, J.W. Pacific Northwest Lab., Richland, WA (United States). May 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930571–25: 183. Electrochemical Society meeting, Honolulu, HI (United States), 16-21 May 1993). Order Number DE93015699. Source: OSTI; NTIS; GPO Dep.

Prior work on the fiber optic spectrochemical emission sensor called HaloSnif™ has been extended to include an ultra-thin membrane which allows passage of volatile organic chlorinated compounds (VOCl). The membrane has been demonstrated to exclude H_2O during VOCl monitoring. The system is capable of measuring VOCl in gas-phase samples or aqueous solutions over a wide linear dynamic range. The lower limit of detection for trichloroethylene (TCE), perchloroethylene (PCE), carbon tetrachloride (CCl_4), and other related compounds in the gas-phase is 1 to 5 $ppm_{v/v}$, and in the aqueous-phase is 5 to 10 mg/L. Waste site characterization and remediation activities often require chemical analysis in the vadose zone and in groundwater. These analyses are typically performed in analytical laboratories using widely accepted standardized methods such as gas chromatography, gas chromatography/mass spectrometry. The new developments with HaloSnif provide rapid field screening which can augment the standardized methods.

27458 (SAND–92-2795C) **Full-field dye concentration measurement within saturated/unsaturated thin slabs of porous media.** Norton, D.L. (Arizona Univ., Tucson, AZ (United States). Dept. of Hydrology); Glass, R.J. Sandia National Labs., Albuquerque, NM (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930408–73: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93015014. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents a full-field dye concentration measurement technique that extends our experimental capabilities to the measurement of transient dye concentration fields within steady state flow fields under unsaturated or saturated conditions. Simple light absorption theory provides a basis for translating images into high resolution dye concentration fields. A series of dye pulse experiments that demonstrate the combined use of the full-field saturation and dye concentration techniques was conducted at four different degrees of saturation. Each of these experimental sequences was evaluated with respect to mass balance, the results being within 5% of the known dye mass input. An image windowing technique allowed us to see increased dispersion due to decreasing moisture content, tailing of concentration at the rear of the dye pulse and slight velocity changes of the dispersive front due to changes in moisture content. The exceptional resolution of dye concentration in space and time provided by this laboratory technique allows systematic experimentation for examining basic processes affecting solute transport within saturated/unsaturated porous media. Future challenges for this work will be to use these techniques to analyze more complex systems involving heterogeneities, scaling laws, and detailed investigations of the relationship between transverse and longitudinal dispersion in unsaturated media.

27459 (SAND–93-0100C) **Portable acoustic wave sensor systems for real-time monitoring of volatile organic compounds.** Cernosek, R.W.; Frye, G.C.; Gilbert, D.W. Sandia National Labs., Albuquerque, NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930557–1: Conference on physics computing, Albuquerque, NM (United States), 31 May - 4 jun 1993). Order Number DE93013753. Source: OSTI; NTIS; GPO Dep.

Portable acoustic wave sensor (PAWS) systems are being developed for real-time, on-line and in situ monitoring of volatile organic compounds (VOCs). These systems are built around surface acoustic wave (SAW) devices coated with viscoelastic polymers. Two independent responses of the SAW sensor, wave velocity and attenuation, are measured to provide information about the chemical species sorbed by the coating. Sensing is rapid and reversible, and coatings can be optimized for particular chemical selectivity and sensitivity. The complete PAWS system consists of two SAW devices (a sensor and a reference), RF oscillator electronics to drive the devices, digital interface/communications electronics, gas handling hardware to sample the environment, and a notebook computer to control the hardware and display responses in real-time. These systems have been demonstrated for on-line monitoring of exhaust stack vapors in environmentally conscious manufacturing (ECM) applications, for real- time documentation of off-gas contaminants from vacuum extraction processes at DOE remediation sites, and for down-hole sensing of volatile organics in vadose zone (above the groundwater level) monitoring wells.

27460 (UCRL-CR–110610) **Documentation and assessment of the history of the Lawrence Livermore National Laboratory Livermore facility, and site CA-SJO-173H, the Carnegie town**

site at Lawrence Livermore National Laboratory Site 300, Alameda and San Joaquin Counties, California. Lawrence Livermore National Lab., CA (United States); Weston (Roy F.), Inc., Albuquerque, NM (United States); Self (William) Associates, Orinda, CA (United States). Aug 1992. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93009504. Source: OSTI; NTIS; INIS; GPO Dep.

This report examines the historic potential of two properties of the US Department of Energy's Lawrence Livermore National Laboratory (LLNL): the facility itself and a known historic archeological site, CA-SJO-173H, the Carnegie town site, contained within LLNL Site 300 in San Joaquin County, California. The history and development of LLNL is presented in Section 3 of the report, while Section 4 is devoted to the Carnegie historic site. Section 5 discusses aspects of the LLNL Livermore Site, as well as the Carnegie town site, in relation to the criteria for eligibility to the National Register of Historic Places contained in 36 CFR 60.4. Preliminary evaluations of National Register eligibility are presented. The recommendations contained in Section 6 define an appropriate avenue to permit the Department of Energy to consult with the State Historic Preservation Office, culminating in Determinations of Eligibility and Effect, if necessary, for the properties in question.

27461 (UCRL-JC–108210) **Holocene faulting near closed landfill Pit 6, Lawrence Livermore National Laboratory Site 300.** Carpenter, D.W. (Lawrence Livermore National Lab., CA (United States)); Taffet, M.J.; Copland, J.R.; Mateik, R.S.; Wade, W.M. Lawrence Livermore National Lab., CA (United States). Feb 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9203247–1: 2. conference on earthquake hazards in the Eastern San Francisco Bay area, Hayward, CA (United States), 25-27 Mar 1992). Order Number DE93009529. Source: OSTI; NTIS; GPO Dep.

Lawrence Livermore National Laboratory's Site 300 test facility, an 11 mi^2 area, is located in the rugged, semiarid Altamont Hills southwest of Tracy, California. Geologic studies conducted at the site in support of environmental assessments of closed landfill Pit 6 reveal the presence of a fault strand showing evidence of repeated movements during late Pleistocene and Holocene time. These studies included airphoto interpretation, geologic mapping, and logging of four exploratory trenches and other exposures. The fault was traced from west of Pit 6 to southeast of the pit, a distance of about 1,500 ft; regional reconnaissance suggests that the fault extends beyond the limits of the area studied in detail. The identified fault strand is not coincident with any previously mapped fault. It occurs within a band of highly deformed Tertiary rocks that is bounded by the Carnegie fault on the north and the Corral Hollow fault on the south. Evidence of Holocene movement within the larger Corral Hollow-Carnegie fault zone indicates that this fault zone should be considered active and could be a source of future strong earthquake motion. Regressions relating total fault length, segment length, and fault plane area suggest that the Corral Hollow-Carnegie fault zone may be capable of generating an earthquake in the range of M_s 6.3 to 7.1. Effects of a strong earthquake on closed landfill Pit 6 would be expected to be slight since the identified Holocene fault trace passes at least 100 ft south of the outer limits of the pit area. However, the effects of strong ground shaking from a local source upon buildings, slopes, and other structures within Site 300 and vicinity should receive further consideration.

27462 (UCRL-JC–111993) **Innovative technologies for groundwater cleanup.** Yow, J.L. Jr. Lawrence Livermore National Lab., CA (United States). Sep 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9209159–8: Eurocourse: technologies for environmental cleanup - soil and groundwater, Ispra (Italy), 21-25 Sep 1992). Order Number DE93013194. Source: OSTI; NTIS; INIS; GPO Dep.

These notes provide a broad overview of current developments in innovative technologies for groundwater cleanup. In this context, groundwater cleanup technologies include site remediation methods that deal with contaminants in ground water or that may move from the vadose zone into ground water. This discussion attempts to emphasize approaches that may be able to achieve significant improvements in groundwater cleanup cost or effectiveness. However, since data for quantitative performance and cost comparisons of new cleanup methods are scarce, preliminary comparisons must be based on the scientific approach used by each method and on the site-specific technical challenges presented by each groundwater contamination situation. A large number of technical alternatives that are now in research, development, and testing can be categorized by the scientific phenomena that they employ and by the site contamination situations that they treat. After reviewing a representative selection of these technologies, one of the new technologies, the Microbial Filter method, is discussed in more detail to highlight a promising in situ groundwater cleanup technology that is now being readied for field testing.

27463 (UCRL-JC–113510) **Radiolytic decomposition of environmental contaminants using an electron accelerator.** Matthews, S.M.; Boegel, A.J.; Caufield, R.A.; Jovanovich, M.C.; Loftis, J.A. Lawrence Livermore National Lab., CA (United States). Apr 1993. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930483–9: 9. waste minimization and pollution prevention conference, San Francisco, CA (United States), 13-15 Apr 1993). Order Number DE93014878. Source: OSTI; NTIS; INIS; GPO Dep.

Halogenated and nonhalogenated hydrocarbons are components of contamination currently found in natural waterways, ground water, and soils as a result of spills and careless disposal practices. The development of proper treatment methodologies for the waste streams producing this environmental damage is now a subject of growing concern. A significant number of these waste stream compounds are chemically stable and are thus resistant to environmental degradation. Numerous researchers have investigated the use of ionizing radiation to decompose chlorinated hydrocarbons in diverse matrices and have proposed various free-radical-induced reaction mechanisms. In this paper, we present results of experimentally measured radiolytically induced decomposition using accelerator-generated bremsstrahlung sources and gamma radiation from cobalt-60. Data are presented on the radiolytically induced reduction in concentration of volatile organic compounds (VOCs) dissolved in water and in air, polychlorinated biphenyl (PCB) dissolved in oil, high explosives dissolved in ground water, and chemical weapon surrogates. The results of these studies suggest the potential use of ionizing radiation as a method of hazardous waste treatment.

27464 (WSRC-MS–93-179) **Composite refraction-reflection stack sections: Tracing faults in the Atlantic coastal plain sediments.** Stephenson, D.E. (Westinghouse Savannah River Co., Aiken, SC (United States)); Coruh, C.; Costain, J.K. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930901–4: Annual meeting of the Society of Exploration Geophysicists, Washington, DC (United States), 26-30 Sep 1993). Order Number DE93013581. Source: OSTI; NTIS; GPO Dep.

Seismic data from the Atlantic Coastal Plain are reprocessed and composite refraction-reflection stack sections produced to investigate basement faults that penetrate upward into Atlantic Coastal Plain sediments in South Carolina. Reprocessing recovered reflections from within the deep crust to the Moho as well as from within thin veneer (300) of the Atlantic Coastal Plain sediments. One of the major objectives of this paper is to discuss the use of shallow refracted arrivals to construct a composite refraction- reflection stack that allows better imaging of the subsurface at shallow depths.

27465 (WSRC-MS–93-201) **Demonstration of risk-based decision analysis in remedial alternative selection and design.** Evans, E.K. (Geraghty and Miller Modeling Group, Reston, VA (United States)); Duffield, G.M.; Massmann, J.W.; Freeze, R.A.; Stephenson, D.E. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9306158–1: 1993 groundwater modeling conference, Boulder, CO (United States), 6-12 Jun 1993). Order Number DE93013692. Source: OSTI; NTIS; INIS; GPO Dep.

This study demonstrates the use of risk-based decision analysis (Massmann and Freeze 1987a, 1987b) in the selection and design of an engineering alternative for groundwater remediation at a waste site at the Savannah River Site, a US Department of Energy facility in South Carolina. The investigation focuses on the remediation and closure of the H-Area Seepage Basins, an inactive disposal site that formerly received effluent water from a nearby production facility. A previous study by Duffield et al. (1992), which used risk-based decision analysis to screen a number of groundwater remediation alternatives under consideration for this site, indicated that the most attractive remedial option is ground-water extraction by wells coupled with surface water discharge of treated effluent. The aim of the present study is to demonstrate the iterative use of risk-based decision analysis throughout the design of a particular remedial alternative. In this study, we consider the interaction between two episodes of aquifer testing over a 6-year period and the refinement of a remedial extraction well system design. Using a three-dimensional ground-water flow model, this study employs (1) geostatistics and Monte Carlo techniques to simulate hydraulic conductivity as a stochastic process and (2) Bayesian updating and conditional simulation to investigate multiple phases of aquifer testing. In our evaluation of a remedial alternative, we compute probabilistic costs associated with the failure of an alternative to completely capture a simulated contaminant plume. The results of this study demonstrate the utility of risk-based decision analysis as a tool for improving the design of a remedial alternative through the course of phased data collection at a remedial site.

27466 (WSRC-RP–92-1397) **Preliminary site selection report for the new sanitary landfill at the Savannah River Site.** Westinghouse Savannah River Co., Aiken, SC (United States). Dec 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93015379. Source: OSTI; NTIS; GPO Dep.

The Savannah River Site (SRS) has proposed a new sanitary landfill (NSL) for solid waste. A site selection team, comprised of representatives from Westinghouse Savannah River Company (WSRC) evaluated potential landfill sites. The site selection team conducted an initial screening of SRS to eliminate unsuitable areas. The screening was based on criteria that were principally environmental factors; however, the criteria also included avoiding areas with unacceptable features for construction or operation of the facility. This initial screening identified seven candidate sites for further evaluation.

27467 (WSRC-RP–93-459) **Projected tritium releases from F & H Area Seepage Basins and the Solid Waste Disposal Facilities to Fourmile Branch.** Looney, B.B.; Haselow, J.S.; Lewis, C.M.; Harris, M.K.; Wyatt, D.E.; Hetrick, C.S. Westinghouse Savannah River Co., Aiken, SC (United States). 15 Mar 1993. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014745. Source: OSTI; NTIS; INIS; GPO Dep.

A large percentage of the radioactivity released to the environment by operations at the Savannah River Site (SRS) is due to tritium. Because of the relative importance of the releases of tritium from SRS facilities through the groundwater to the environment, periodic evaluation and documentation of the facility operational status, proposed corrective actions, and projected changes/reductions in tritium releases are justified. Past, current, and projected tritium releases from the F and H Area Seepage Basins and the Solid Waste Disposal Facilities (SWDF) to Fourmile Branch are described. Each section provides a brief operational history along with the current status and proposed corrective actions. A conceptual model and quantitative estimates of tritium release from the facilities into the groundwater and the environment are developed. Tritium releases from the F and H Area Seepage Basins are declining and will be further reduced by the implementation of a groundwater corrective action required by the Resource Conservation and Recovery Act (RCRA). Tritium releases from the SWDF have been relatively stable over the past 10 years. It is anticipated that SWDF tritium releases to Fourmile Branch will remain approximately at current levels for at least 10–20 years. Specific characterization activities are recommended to allow an improved projection of tritium flux and to assist in developing plans for plume mitigation. SRS and the South Carolina Department of Health and Environmental Control are developing groundwater corrective action plans for the SWDF. Portions of the SWDF are also regulated under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). Reduction of tritium flux is one of the factors considered in the development of the RCRA/CERCLA groundwater corrective action. The final section of the document presents the sum of the projected tritium fluxes from these facilities to Fourmile Branch.

27468 (WSRC-TR–93-063) **F-Area Acid/Caustic Basin groundwater monitoring report: Fourth quarter 1992 and 1992 summary.** Westinghouse Savannah River Co., Aiken, SC (United States). Mar 1993. 68p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93015381. Source: OSTI; NTIS; GPO Dep.

During fourth quarter 1992, samples from the six FAC monitoring wells at the F-Area Acid/Caustic Basin were analyzed for indicator parameters, groundwater quality parameters, parameters indicating suitability as drinking water, and other constituents. Monitoring results that exceeded the final Primary Drinking Water Standards (PDWS) or the Savannah River Site (SRS) flagging criteria or turbidity standard during the quarter are the focus of this report. Gross alpha exceeded the final PDWS in downgradient well FAC 4. Iron exceeded the Flag 2 criterion in 5 of the 6 wells; a change in sampling procedure accounts for marked increases. Three samples were elevated for each of the following constituents: manganese, total organic carbon, and total organic halogens. Turbidity equaled or exceeded the SRS standard in wells FAC 7 and 8.

27469 (WSRC-TR–93-065) **K-Area Acid/Caustic Basin groundwater monitoring report: Fourth quarter 1992 and 1992 summary.** Westinghouse Savannah River Co., Aiken, SC (United States). Mar 1993. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93013574. Source: OSTI; NTIS; INIS; GPO Dep.

During fourth quarter 1992, samples from the KAC monitoring wells at the K-Area Acid/Caustic Basin were analyzed for indicator parameters, groundwater quality parameters, parameters indicating suitability as drinking water, and other constituents. New wells KAC 8 and 9 also were sampled for GC/MS VOA (gas chromatograph/mass spectrometer volatile organic analyses). Monitoring results that exceeded the final Primary Drinking Water Standards (PDWS) or the Savannah River Site (SRS) flagging criteria or turbidity standard during the quarter are discussed in this report. Iron exceeded the Flag 2 criterion in wells KAC 6 and 7, and specific conductance exceeded the Flag 2 criterion in new well KAC 9. No samples exceeded the SRS turbidity standard.

27470 (WSRC-TR–93-129) **Results of the second quarter tritium survey of the F- and H-Area seeplines, September 1992.** Dixon, K.L.; Rogers, V.A. Westinghouse Savannah River Co., Aiken, SC (United States). Feb 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93015380. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Sciences Section (ESS) established a quarterly monitoring program of the Four Mile Creek seepline down gradient from the F- and H-Area seepage basins. The program surveys and tracks changes in tritium, specific conductivity, and pH for the seepline water. Measurements from the second quarter survey (September 1992) showed lower tritium and conductivity measurements and more natural pH values (pH 5–6) than measurements from previous studies. The results of the first two quarterly surveys suggest that infiltration of rainfall may be diluting and flushing the contaminants from the groundwater system. More measurements are needed to confirm these trends.

27471 (YJT–92-21) **Review of the sorption of radionuclides on the bedrock of Haestholmen and on construction and backfill materials of a final repository for reactor wastes.** Kulmala, S. (Helsinki Univ. (Finland). Dept. of Radiochemistry); Hakanen, M. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Oct 1992. [86p.] Order Number DE93630630. Source: OSTI; NTIS; INIS.

Imatran Voima Oy (IVO) has plans to build a final repository for reactor wastes in the bedrock of the nuclear power plant site at

Haestholmen, Loviisa. This report summarizes the sorption studies of radionuclides in Finnish bedrock performed at the Department of Radiochemistry, University of Helsinki. The values of mass distribution ratios, K_d, and surface distribution ratios, K_a; of carbon, calsium, Zirconium, niobium, cobalt, nickel, strontium, cesium, uranium, plutonium, americium, thorium, chlorine, iodine and technetium are surveyed. Special attention is paid to the sorption data for construction and backfill materials of rector waste repository and the bedrock of Haestholmen. Safety assessment of a repository includes calculations of migration of the waste element in construction materials and backfill in the nearfield and in bedrock. Retardation by sorption of waste nuclides compared to groundwater flow is described by using distribution ratios between solid materials and water. (orig.).

27472 (YJT–92-29) **A review of the seismotectonics of Finland.** Saari, J. (Imatran Voima Oy, Vantaa (Finland)). Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Dec 1992. [80p.] Order Number DE93629308. Source: OSTI; NTIS; INIS.

Recent major improvements in our knowledge about seismicity, crustal structure, primary stress field and tectonics together with other extensive geophysical and geological investigations have provided a good basis for a review of the seismotectonic setting of Finland. Correlations have been found to be present for the seismicity in Finland with the seismotectonic zones inside the Baltic Shield and with the seismicity of the North Atlantic Ridge. The current stress field in the Fennoscandian Shield seems to be dominated by ridge push forces. This conclusion is based on earthquake focal mechanisms, in-situ stress measurements and geodetic information. The report discusses the possible block movements induced by future glaciation. Location of the seismotectonic zones, duration of the glaciation and the presence of locally anomalous shear stresses seem to relate to the distribution of the discovered post-glacial faults in Fennoscandia. Special attention is paid to local seismotectonics. Potential direct or indirect effects on underground openings are possible due to local earthquakes or the creep. The importance of slow deformation processes in the bedrock is emphasized. (orig.).

27473 (AEA-EE–0137) **A survey of fish and shellfish radioactivity levels in Cumbrian near-shore waters (1990).** McKay, W.A.; Memmott, S.D. AEA Environment and Energy, Harwell (United Kingdom). Sep 1991. [32p.] Order Number DE93630666. Source: OSTI; NTIS (US Sales Only); INIS.

Fish (cod and plaice), crustacea, (crab and lobster), and molluscs (winkle) samples were collected from Cumbrian near-shore waters in 1990. The samples were analysed for total beta activity and a range of gamma and alpha emitters. In general, the radionuclide levels are lower than those measured in the previous 3 years of the study and the intake of radioactivity by all consumers should have reflected this. The dose estimated to have been incurred by the critical group of local seafood consumers near Sellafield in 1990, mainly due to winkle consumption, is less than 0.1 mSv and thus significantly below the limit of 1 mSv per year for long term radiation exposure recommended by the International Commission on Radiological Protection. (author).

27474 (BNL–48476) **Greenland Sea observations.** Gudmandsen, P. (Technical Univ. of Denmark, Lyngby (Denmark). Inst. of Electromagnetics); Mortensen, H.B.; Pedersen, L.T.; Skriver, H.; Minnett, P. Brookhaven National Lab., Upton, NY (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9211215–1: 1. ERS-1 symposium: space in the service of our environment, Cannes (France), Nov 1992). Order Number DE93009351. Source: OSTI; NTIS; GPO Dep.

ERS-1 SAR data have been acquired over the Greenland Sea and Fram Strait during two periods, the Ice Phase of three-day repeat cycle from January to March 1992 and a one-month period in the 35-day repeat cycle from 16 July to 15 August 1992. Most data became available by way of the Broadband Data Dissemination System, i.e. with a spatial resolution of about 100 m. With these data various algorithms have been tested to derive sea ice parameters such as ice extent, ice concentration and ice displacement. In the latter period data were collected to support the activities of a research vessel in the area mainly related to the large polynyas that form east and north of Greenland. The formation of polynyas could clearly be outlined but also other phenomena were observed related to the influence of wind streets and gravity waves associated with the atmospheric boundary layer. The data will have to be studied further including full-resolution data to substantiate the conclusions arrived at.

27475 (CONF-930160–15) **Removal of uranium by biosorption.** Faison, B.D. (Oak Ridge National Lab., TN (US)); Bonner, J.D.; Munroe, N.D.; Bloomingburg, G.F. Oak Ridge National Lab., TN (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 2. semi-annual Office of Technology Development (OTD) information meeting; Houston, TX (United States); 26-28 Jan 1993. Order Number DE93015445. Source: OSTI; NTIS; INIS; GPO Dep.

The technology developed here will exploit the ability of microorganisms to remove dissolved metals from aqueous solutions. Microbial sorbents for uranium will be immobilized biosorbents will be deployed ex situ within flow-through reactors for the continuous or semicontinuous treatment of recovered wastewaters. The proposed technology will primarily be applied within a pump-and-treat process using immobilized biosorbents for the large-scale, long-term remediation of uranium-laden surface water or groundwater impoundments (environmental restoration). The technology may be equally useful as an "end-of-pipe" treatment of process effluents (waste management). Successful operation of this process will achieve immobilization of the targeted waste and accompanying volume reduction.

27476 (CONF-9304144–2) **Trace contaminant determination in fish scale by laser ablation technique.** Lee, I.; Coutant, C.C.; Arakawa, E.T. Oak Ridge National Lab., TN (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 2. international conference on laser ablation; Knoxville, TN (United States); 19-22 Apr 1993. Order Number DE93015426. Source: OSTI; NTIS; GPO Dep.

Laser ablation on rings of fish scale has been used to analyze the historical accumulation of polychlorinated biphenyls (PCB) in striped bass in the Watts Bar Reservoir. Rings on a fish scale grow in a pattern that forms a record of the fish's chemical intake. In conjunction with the migration patterns of fish monitored by ecologists, relative PCB concentrations in the seasonal rings of fish scale can be used to study the PCB distribution in the reservoir. In this study, a tightly-focused laser beam from a XeCl excimer laser was used to ablate and ionize a small portion of a fish scale placed in a vacuum chamber. The ions were identified and quantified by a time-of-flight mass spectrometer. Studies of this type can provide valuable information for the Department of Energy's (DOE) off-site clean-up efforts as well as identifying the impacts of other sources to local aquatic populations.

27477 (CONF-930830–17) **Ocean uptake of carbon dioxide.** Peng, Tsung-Hung (Oak Ridge National Lab., TN (United States)); Takahashi, Taro. Oak Ridge National Lab., TN (United States). [1993]. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From National conference and exposition on heat transfer; Atlanta, GA (United States); 8-11 Aug 1993. Order Number DE93012967. Source: OSTI; NTIS; INIS; GPO Dep.

Factors controlling the capacity of the ocean for taking up anthropogenic $C0^2$ include carbon chemistry, distribution of alkalinity, pCO^2 and total concentration of dissolved $C0^2$, sea-air pCO^2 difference, gas exchange rate across the sea-air interface, biological carbon pump, ocean water circulation and mixing, and dissolution of carbonate in deep sea sediments. A general review of these processes is given and models of ocean-atmosphere system based

on our understanding of these regulating processes axe used to estimate the magnitude of $C0^2$ uptake by the ocean. We conclude that the ocean can absorb up to 35% of the fossil fuel emission. Direct measurements show that 55% Of $C0^2$ from fossil fuel burning remains in the atmosphere. The remaining 10% is not accounted for by atmospheric increases and ocean uptake. In addition, it is estimated that an amount equivalent to 30% of recent annual fossil fuel emissions is released into the atmosphere as a result of deforestation and farming. To balance global carbon budget, a sizable carbon sink besides the ocean is needed. Storage of carbon in terrestrial biosphere as a result of $C0^2$ fertilization is a potential candidate for such missing carbon sinks.

27478 (DOE/ER/60353–T1) **Biological processes in the water column of the South Atlantic Bight: Phytoplankton response: Final progress report.** Verity, P.G.; Yoder, J.A. Skidaway Inst. of Oceanography, Savannah, GA (United States). 10 Mar 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-85ER60353. Order Number DE93016257. Source: OSTI; NTIS; GPO Dep.

This study addressed shelf-wide processes and nearshore (coastal boundary zone) processes occurring in the southeastern. Coastal boundary zone (CBZ) US continental shelf dynamics involve studies of circulation and of biological and chemical transformations. Continental shelf processes affect the removal of material from the coastal boundary zone into areas where the material no longer interacts with or influences concentrations in the CBZ. The two arbitrarily separate components are, in fact, unified. The CBZ typically extends about 300 km alongshore and about 20 km offshore from its center off Savannah, Georgia, where most runoff occurs. The rates of biological and chemical transformations are controlled by proximity to the bottom and the amounts of fine suspended organic matter originating from rivers and salt marshes. Once material is removed from this zone, either by alongshelf or cross-shelf advection to regions where the materials are no longer in contact with the bottom, the suite of factors governing the rates of chemical and biological transformations changes. The determination of contrasting rates in these two environments was one of the central focus of the South Atlantic Bight program.

27479 (DOE/ER/60980–T1) **[CO_2 measurements along the WOCE P-16 and 19 sections in the south Pacific Ocean: A joint LDGO/WHOI program]: Final report.** Goyet, C. Woods Hole Oceanographic Institution, MA (United States). [1992]. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER60980. Order Number DE93015576. Source: OSTI; NTIS; GPO Dep.

With the support from the Department of Energy, we participated in the World Ocean Circulation Experiment (WOCE) cruises to document the spatial variation of the properties of the carbonate system over the world ocean. With the other members of the DOE $C0_2$ science team, we took advantage of the initial postponed ship schedule to initiate an intercomparison of total dissolved inorganic carbon measurement in seawater. This work has proven to be essential for the measurements performed at sea soon after. We participated in 2 cruises in the Equatorial Pacific Ocean along 150° W and 135° W. Surface seawater $C0_2$ partial pressure (pCO_2) measured along 150° W has been compared with earlier measurements made by Ray Weiss in 1979 along the same cruise track. The large variations of surface seawater pCO_2 (pCO_2^{sea}) on short spatial and temporal scale do not allow us to determine whether anthropogenic $C0_2$ modified $pC0_2^{sea}$ in this ocean area. In the laboratory we also investigated a different means of measuring total alkalinity by thermometry. In this highly variable ocean, several complementary approaches are now underway to detect the anthropogenic signal and predict future changes: Continual monitoring of the carbonate properties in the ocean; Modeling and remote sensing; and monitoring of atmospheric pCO_2 and pO_2. In this report, we summarize the results of the at-sea measurements of the parameters of the carbonate system in seawater on the WOCE cruises P16c and P17c, as well as the theoretical and experimental results of laboratory studies made to improve the measurement techniques.

27480 (DOE/ER/61013–T2) **Mechanisms controlling the production and transport of methane, carbon dioxide, and dissolved solutes within a boreal peatland: Progress report, July 15, 1992–July 14, 1993.** Siegel, D.I. Syracuse Univ., NY (United States). Dept. of Geology. 24 Jun 1993. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER61013. Order Number DE93017089. Source: OSTI; NTIS; GPO Dep.

The role of freshwater peatlands in the global methane cycle remains uncertain. Field measurements of methane emissions tend to be highly variable across a peatland and exhibit sharp seasonal fluctuations. The process of extrapolating these variable measurements to regional estimates is further complicated by rudimentary knowledge of the environmental controls can the production and emissions of methane from peat. The distribution of methanogenesis within the peat profile will strongly influence the response of methane emissions to potential climatic changes. During the summers of 1990 and 1991 we conducted a study on the mechanisms for the production, transport, and storage of methane within the Glacial Lake Agassiz peatland region as the regional climate shifted from extreme drought to a period of normal rainfall. This natural experiment provided unexpected insights on the linkages among climate, hydrology, and the methane cycle in large peat basins. This report presents project progress for period July 15, 1992–July 14, 1993.

27481 (DOE/ER/61422–1) **Controls on marine carbon fluxes via phytoplankton-mesoplankton interactions in continental shelf waters: Six month progress report.** Shapiro, L.; Sherr, B.F.; Sherr, E.B. Oregon State Univ., Corvallis, OR (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-92ER61422. Order Number DE93015059. Source: OSTI; NTIS; GPO Dep.

The project is an in-depth evaluation of the phytoplankton → phagotrophic protist trophic link. The principal goals of the first year are to develop methods for the second phase of the Ocean Margins Program: investigations in the field. Our project is focused on: impact of grazing by phagotrophic protists on phytoplankton; impact of grazing by phagotrophic protists on bacterioplankton; taxon-specific growth rates of phytoplankton in situ, as they are affected by phagotrophy rates.

27482 (DOE/ER/61423–1) **Controls on marine carbon fluxes via phytoplankton-mesoplankton interactions in continental shelf waters: Progress report, December 1992.** Shapiro, L.; Sherr, B.F.; Sherr, E.B. Oregon State Univ., Corvallis, OR (United States). Coll. of Oceanography. 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-92ER61423. Order Number DE93015058. Source: OSTI; NTIS; GPO Dep.

The principal goals of our projects were to develop methods for the second phase of the Ocean Margins Program: investigations in the field. Our project is focused on: (1) Impact of grazing by phagotrophic protists on phytoplankton, particularly on phototrophic cells < 5 μm in size which are not effectively grazed by metazooplankton; the impact of grazing by phagotrophic protists on bacterioplankton; and the taxon-specific growth rates of phytoplankton in situ, as they are affected by phagotrophy rates.

27483 (DOE/ID/13042–8) **Geophysical logging studies in the Snake River Plain Aquifer at the Idaho National Engineering Laboratory: Wells 44, 45, and 46.** Morin, R.H. (Geological Survey, Denver, CO (United States)); Paillet, F.L.; Taylor, T.A.; Barrash, W. Geological Survey, Denver, CO (United States). 1993. 50p. Sponsored by USDOE, Washington, DC (United States); Department of the Interior, Washington, DC (United States). DOE Contract FG07-91ID13042. (USGS/WRI–92-4184). Order Number DE93012949. Source: OSTI; NTIS; INIS; GPO Dep.

A geophysical logging program was undertaken to vertically profile changes in the hydrology and hydrochemistry of the Snake River Plain aquifer underlies the Idaho National Engineering Laboratory (INEL). Field investigations were concentrated within an area west of the Idaho Chemical Processing Plant (ICPP) in three wells that penetrated the upper 190 feet of the aquifer. The logs obtained in these wells consisted of temperature, caliper, nuclear (neutron porosity and gamma-gama density), natural gamma, borehole televiewer, gamma spectral, and thermal flowmeter (with and without

pumping). The nuclear, caliper, and televiewer logs are used to delineate individual basalt flows or flow units and to recognize breaks between flows or flow units at interflow contact zones and sedimentary interbeds. The temperature logs and flowmeter measurements obtained under ambient hydraulic head conditions identified upward fluid-circulation patterns in the three wells. Gamma-spectral analyses performed at several depths in each well showed that the predominant source of gamma radiation in the formation at this site originates mainly from potassium (^{40}K). However, ^{137}Cesium was detected at 32 feet below land surface in well 45. An empirical investigation of the effect of source-receiver spacing on the response of the neutron-porosity logging tool was attempted in an effort to understand the conditions under which this tool might be applied to large-diameter boreholes in-unsaturated formations.

27484 (DOE/ID–22105) **Water-level data for selected wells on or near the Idaho National Engineering Laboratory, Idaho, 1983–1990.** Ott, D.S.; Edwards, D.D.; Bartholomay, R.C. Geological Survey, Idaho Falls, ID (United States). Nov 1992. 307p. Sponsored by Department of the Interior, Washington, DC (United States). (USGS-OFR–92-643). Order Number DE93012162. Source: OSTI; NTIS; INIS; Books and Open-File Reports Section, US Geological Survey, Box 25425, Federal Center, Denver, CO 80225; GPO Dep.

The US Geological Survey has collected water-level data from wells completed in the Snake River Plain aquifer at the Idaho National Engineering Laboratory in southeastern Idaho since 1949. Water-level data collected through 1982 are presented in previous reports. Water-level data collected from 1983 through 1990 from 137 wells are presented in this report.

27485 (DOE/NV/10845–16) **Groundwater chemistry at the Nevada Test Site: Data and preliminary interpretations.** Chapman, J.B.; Lyles, B.F. Nevada Univ., Reno, NV (United States). Water Resources Center. Mar 1993. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE93017131. Source: OSTI; NTIS; GPO Dep.

The interpretation of chemical analyses of groundwater collected at and near the Nevada Test Site (NTS) has been vital in developing conceptual models of groundwater flow in the area. These conceptual models are tested using recent chemical data generated by the Desert Research Institute, as well as historic analyses from the US Geological Survey. A total of 81 wells are represented by analyses from 1957 to 1990, with generally excellent agreement between repeat samples from the same location. As identified by previous workers, three hydrochemical facies are represented by the samples: Ca-Mg-HCO_3 water in carbonate rocks or alluvium derived from carbonates, Na-K-HCO_3 water in volcanic rocks and alluvium derived from volcanic rocks, and a mixed fades found in many carbonate and alluvium water samples, and some volcanic waters. There is a general lack of lateral continuity in chemical characteristics along presumed flowpaths within each hydrologic unit (alluvium, carbonate, and volcanic). Though a lack of continuity between basins on the east side of the NTS was expected for water in alluvial and volcanic units due to the absence of interbasin flow, chemical differences observed within individual basins suggest a dominance of vertical over lateral flow. Groundwater in volcanic materials on the east side of Yucca and Frenchman Flats and on the west side of Pahute Mesa and Yucca Mountain has a nearly pure Na-K-HCO_3 signature that reflects contact with primarily volcanic material. Groundwater in volcanic units in the middle of the NTS and on the east side of Pahute Mesa contains a higher proportion of Ca, Mg, Cl, and SO_4 than the other volcanic waters and indicates the contribution of water from the upper carbonate aquifer and/or hydrothermally altered regions.

27486 (DOE/RL–92-12) **Sampling and analysis of 100 Area springs.** Westinghouse Hanford Co., Richland, WA (United States); USDOE Richland Field Office, WA (United States). Feb 1992. 109p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93013032. Source: OSTI; NTIS; INIS; GPO Dep.

This report is submitted in fulfillment of Hanford Federal Facility Agreement and Consent Order Milestone M-30-01, submit a report to EPA and Ecology evaluating the impact to the Columbia River from contaminated springs and seeps as described in the operable unit work plans listed in M-30-03. Springs, seeps, sediments, and the Columbia River were sampled for chemical and radiological analyses during the period September 16 through October 21, 1991. A total of 26 locations were sampled. Results of these analyses show that radiological and nonradiological contaminants continue to enter the Columbia River from the retired reactor areas of the 100 Area via the springs. The primary contaminants in the springs are strontium-90, tritium, and chromium. These contaminants were detected in concentrations above drinking water standards. Analysis of total organic carbon were run on all water samples collected; there is no conclusive evidence that organic constituents are entering the river through the springs. Total organic carbon analyses were generally higher for the surface water than for the springs. The results of this study will be used to develop a focused, yet flexible, long-term spring sampling program. Analysis of Columbia River water samples collected at the Hanford Townsite (i.e., downstream of the reactor areas) did not detect any Hanford-specific contaminants.

27487 (DOE/RL–93-09) **Annual report for RCRA groundwater monitoring projects at Hanford Site Facilities for 1992.** USDOE Richland Field Office, WA (United States). Feb 1993. 494p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014038. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the annual evaluation of 19 Resource Conservation and Recovery Act of 1976 (RCRA) groundwater monitoring projects and 1 nonhazardous waste facility at the US Department of Energy (DOE) Hanford Site. This document complies with regulations found in the State of Washington Administrative Code (WAC) as follows: (1) Dangerous Waste Regulations, WAC 173-303 (Ecology 1991) for hazardous wastes, and (2) Minimum Functional Standards for Solid Waste Handling, WAC 173-304 (Ecology 1989) for nonhazardous wastes. This report is not intended to be a comprehensive presentation of Hanford Site hydrogeology. Further information on each of the facilities can be found in the references cited within. The report meets the federal requirements for Interim Status Standards for Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities, 40 CFR 265 subpart F (EPA 1989a); and Criteria for Classification of Solid Waste Disposal Facilities and Practices, 40 CFR 257 (EPA 1990) for nonhazardous wastes. This annual report is based on analytical data received from the analytical laboratories between October 1991 and November 1992, with the exception of nitrate data which dates back to June 1991. The November 1992 cutoff date represents results from samples collected through September 30, 1992. This report summarizes information obtained for facilities from the October–December 1991 quarterly report through the July–September 1992 quarterly report (DOE-RL 1992a, DOE-RL 1992b, DOE-RL 1992c, and DOE-RL 1993). The groundwater sampling and laboratory reporting performance are presented in Appendix A.

27488 (ETDE-IT–93-173) **Determination of Cu, Ni, Zn, Co and Mn in sea water by chelation ion chromatography.** Caprioli, R.; Torcini, S. ENEA, Casaccia (Italy). 1992. 18p. (CONF-9209366–1: International chromatography symposium 1992, Linz (Austria), 21-24 Sep 1992). Order Number DE93799192. Source: OSTI; NTIS (US Sales Only).

Pre-concentration and determination of trace elements in sea water by Chelation Ion Chromatography (CIC) was studied. For the retention of metal ions (0.25-0.30 M), ammonium acetate (at pH 4.8-5.1) and macro-porous iminodiacetate chelating resin were used. This system (CIC) permits trace and ultra-trace determination of metals in a variety of complex matrices expecially those high in alkali and alkaline-earth metals. The detection limit ranges from 0.1 to 0.5 nanogram. Satisfactory results are obtained in the range, 0.05-0.5 ug/L, when 60 ml of sample are pre-concentrated. In this work, the analysis of Zn, Cu, Ni, Co, and Mn in the Venice lagoon area were studied. The results acquired by chelation ion chromatography were compared with those obtained using the preconcentration of metals with dithizone and APDC in chloroform and analyzed by graphite furnace AAS.

27489 (ETDE-IT–93-177) **Monitoring program for evaluation of pollution level of Italian harbour sediments: General description.** Caricchia, A.M.; Chiavarini, S.; Cremisini, C.; Morabito, R.; Brondi, A.; Vitali, M. ENEA, Casaccia (Italy); Rome Univ. (Italy). 1992. 15p. (CONF-9210194–11: International symposium on environmental contamination in Central and Eastern Europe, Budapest (Hungary), 12-16 Oct 1992). Order Number DE93799197. Source: OSTI; NTIS (US Sales Only); INIS.

As part of a water pollution monitoring campaign, 120 sediment cores were sampled in the main Italian harbour basins, obtaining a total of 360 samples (3 subsamples at different depths for each core). All the samples were analyzed for several parameters, including physical characteristics, microbiological contamination indices, inorganic pollutants, and 36 selected samples were analyzed for organic micropollutants as well. In particular, PCB, chlorinated pesticides, PAH (polycyclic aromatic hydrocarbons) and organo-tin compounds were considered. A general description of the whole project, as well as, a description of the sampling sites are reported.

27490 (GTK-YST–80) **Measurements of hydraulic conductivity in deep bedrock at Palmottu, Outokumpu, Pori and Ylivieska.** Ahonen, L. Geological Survey of Finland, Espoo (Finland). 1992. [42p.] (In Finnish). Order Number DE93629316. Source: OSTI; NTIS; INIS.

Hydraulic conductivity of the bedrock was studied using a double packer equipment fitting the small-diameter drillholes (46 mm). Test method was a slug test, in which the pressure of the test section is reduced by removing water from a tube connected to the test section and, subsequently, monitoring the recovery of the original pressure. In the work, methods of interpretation suitable for the test method are examined, and compared by means of graphical simulations. Their relevance in the case of measurements in fractured crystalline bedrock are discussed. In the method of Hvorslev, the recovery rate is assumed to be directly proportional to residual drawdown and to the hydraulic conductivity of the test section and, consequently, the effect of specific storage is neglected. In other methods of interpretations (e.g. 'Cooper'- method), assuming radial flow from porous aquifer, specific storage is taken into consideration. Different methods of interpretation lead to dissimilar theoretical responses on recovery vs. time graphics. Skin-effect and outer boundary effects also have an influence on the shape of recovery curve. There is no major differences in K-values obtained by different methods of interpretation. The study sites represent different lithological environments, comprising migmatitic gneisses with granitic interlayers (Palmottu); a complex association of serpentine, black schist, quartzite, dolomite and scram (Outokumpu); arkosic sandstone (Pori); and mafic/ultramafic intrusion (Ylivieska).

27491 (INIS-mf–12758, pp. 489-494) **Determination of dispersion coefficients in the River Plate.** Maggio, G.E. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Dept. de Aplicaciones Tecnologicas); Graino, J.G.; Kopp, U.I.; Tripoli, C.R. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The determination of dispersion coefficients of contaminants through a radioactive tracer was performed as a contribution to the development of a mathematical model for a zone of the River Plate, close to the effluent discharge. During March 1987, six operations of tracer (I-131) injection and follow-up were carried out. The injection was performed by breaking a bulb under water and the follow-up of the 'radioactive spot' was done by means of a boat. Once the 'radioactive spot' was located (approximately 2 hours after the injection) a series of transversal movements over it was effected, measuring the activity concentration by means of a submerged detector. At the same time the coordinates of each point were determined in order to draw a map of the activity distribution. This procedure was repeated for different spot positions. This set of data can be plotted on a map of the zone under study, so as to obtain a set of iso activity curves. However, these curves would be representative provided that corrections are made for the boat speed, the water speed and the half-life of radionuclide. From each set of iso activity curves, the variance and the increase of variance, as well as the dispersion coefficients, can be determined. This procedure was applied to each one of the six above mentioned operations. Presently, different values of dispersion coefficient are available for different river conditions. These values, together with other parameters, such as wind velocity, temperature, salinity, bacterial behaviour, etc., will allow the calibration of the mathematical model. (Author).

27495 (IVL-B–1092) **The use of aquatic organisms as environmental indicators.** Steiner, E. Swedish Environmental Research Inst., Stockholm (Sweden). Feb 1993. 88p. (In Swedish). Order Number DE93500712. Source: OSTI; NTIS.

This report is based on literature from the period 1949-1991. It includes a review on the environmental requirements of different taxa (as phytoplankton, waterplants, zooplankton and bottom fauna). In the report possible structures and changes caused by acidification under oligotrophic and eutrophic conditions are described. Over the last decade the use of biological parameters in monitoring has grown in importance and is likely to increase even more in the future. Both environmental indicators (species with narrow requirements) and bioindicators (species used for semiquantitative determination of bioavailability of xenobiotics) are useful. The sensitivity of organisms for e.g. acidification, oxygen deficiency, metal and oil pollutants and nutrients varies. For instance Mayflies has proved very suitable as an indicator of acidification, while bottom fauna (mainly chironomids and oligochaetes) has showed useful for evaluating ecological effects caused by industrial effluents, oxygen deficiency and nutrients. Diatoms is another useful group of indicators, particularly for oligotrophic and eurotrophic conditions. (31 refs., 6 figs.).

27496 (IVL-B–1097) **Aquatic model ecosystems for studies of ecological effects of pollution.** Axelsson, B. Swedish Environmental Research Inst., Stockholm (Sweden). Feb 1993. 53 p.p. (In Swedish). Order Number DE93500715. Source: OSTI; NTIS.

This is a literature review dealing with experiments with aquatic model ecosystems and similar multi-species experiments undertaken during investigations of pollutants and their effects. Descriptions of techniques used in such experiments are summarized;

these techniques being, for example, whole-lake experiments, pelagic sacks, limno-corrals, tanks, pools, dams, streams, and laboratory scale systems. Conclusions reached in earlier reviews on model ecosystems are summarized. Among other things, the role of these systems in bridging the gap between field and laboratory studies is dealt with. (80 refs., 8 figs., 2 tabs.).

27497 (MAFF-FRTR–93) **Ituna: a model of the Solway Firth.** Gurbutt, P.A. Ministry of Agriculture, Fisheries and Food, Lowestoft (United Kingdom). Directorate of Fisheries Research. 1993. [13p.] Order Number DE93630667. Source: OSTI; NTIS (US Sales Only); INIS.

During a review of the U.K. Directorate of Fisheries Research modelling requirements, Falconer's two-dimensional tidal model was identified as being one which could be acquired relatively cheaply and adapted to examine the dispersion of radionuclides in estuaries, particularly those of the eastern Irish Sea. This report documents efforts to set up this model for the Solway Firth and to introduce a two-dimensional sediment transport code. Even though the work on the Solway has been suspended, because there are insufficient data to validate the model, the lessons learnt are worth recording for future use, and could be adapted for example, to the Ribble Estuary. The main body of the report is divided into four parts, namely those on the equations being solved, the discretisation of the equations in the computer program and the method of solution, and that giving some samples of the unvalidated results for the Solway. (author).

27498 (OEFZS–4657) **International Atomic Energy Agency co-ordinated research programme 'the safety assessment of near-surface radioactive waste disposal facilities (NSARS)'.** Rejlek, G. (Hauptabteilung Entsorgungstechnik, Bereich Umwelt- und Verfahrenstechnik, Forschungszentrum Seibersdorf, Seibersdorf (Austria)). Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Nov 1992. [23p.] Order Number DE93627956. Source: OSTI; NTIS (US Sales Only); INIS.

This is the contribution of the research program NSARS organized by IAEA. The computer code SASTO was used to simulate the NSARS test code Nr 1. Features of the model used are described. Chapters are on the release to the geosphere, the radionuclide transport models and the intrusion scenarios (house buildings, farming, farm residential).

27499 (ORNL/FTR–4188) **[Travel to Bermuda to participate in the North Atlantic Treaty Organization (NATO) advanced research workshop on biogeochemical ocean-atmosphere transfers]: Foreign trip report, January 26–31, 1992.** Peng, Tsung-Hung. Oak Ridge National Lab., TN (United States). 14 Feb 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011295. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the NATO Advanced Research Workshop and presented an invited lecture entitled "Limiting Nutrients and Interhemispheric Transport of Carbon through the Ocean." This workshop specifically addressed atmosphere-to-ocean and ocean-to- atmosphere fluxes of key elements and compounds important in determining global climate.

27500 (ORNL/FTR–4509) **Biological markers and indicators of marine ecosystem health: Foreign trip report, November 21–28, 1992.** Shugart, L.R. Oak Ridge National Lab., TN (United States). 16 Dec 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009785. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In response to the growing need to assess biological responses to anthropogenically induced changes and to define environmental criteria that can be used to indicate the health of marine ecosystems, the Group of Experts on the Scientific Aspects of Marine Pollution (GESAMP) established Working Group 33 (WG-33) on Indicators of Marine Ecosystem Health. The U.N. Environmental Program (UNEP) convened the first meeting of WG-33 at its regional office in Geneva from November 23 through 27, 1992.

27501 (ORNL/M–2533) **Belted kingfishers as ecological monitors of contamination: A review.** Landrum, C.L. (North Texas Univ., Denton, TX (United States). Dept. of Biology); Ashwood, T.L.; Cox, D.K. Oak Ridge National Lab., TN (United States). Mar 1993. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93008983. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication No. 4017.

Aquatic systems serve as transport pathways and reservoirs for most of the contaminants known to be present on the Oak Ridge Reservation (ORR). Organisms that live in aquatic systems accumulate some of these contaminants from their food and directly from the water or sediment. A wide array of terrestrial organisms feeds on aquatic organisms and may accumulate contaminants from aquatic prey. The belted kingfisher (Ceryle alcyon) is a piscivorous and territorial avian species that may be a suitable monitor of contaminant accumulation at specific sites on the ORR. A kingfisher collected on White Oak Lake in 1991 had a ^{137}Cs concentration of 568 pCi/g in muscle tissue, which exceeds levels found in any other waterfowl collected from the lake. An investigation into the efficacy of using the kingfisher as an ecological indicator of aquatic contaminants on the ORR was initiated in late August 1992. The primary objective of this study was to acquire information concerning the ecology of the kingfisher to determine how the species could be used within the framework of the Biological Monitoring and Abatement Program at Oak Ridge National Laboratory (ORNL). A second important objective of the study was to examine the possible somatic and reproductive effects of polychlorinated biphenyls (PCBs), Hg, and various radioactive contaminants on piscivorous birds by reviewing pollution ecology studies conducted on those species.

27502 (PNL–8653) **Mollusc survey of the Hanford Site, Benton and Franklin Counties, Washington.** Frest, T.J.; Johannes, E.J. Pacific Northwest Lab., Richland, WA (United States); Deixis Consultants, Seattle, WA (United States). May 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93014372. Source: OSTI; NTIS; GPO Dep.

Assessment of the beneficial uses of the Columbia River and surrounding land at Hanford is enhanced by knowing the distribution of the plants and animals that live there. Deixis Consultants conducted surveys to determine the distribution of land and freshwater molluscs (malacofauna) on the US Department of Energy's Hanford Site and surrounding areas for the Pacific Northwest Laboratory. The surveys were conducted in 1992. Five species of freshwater molluscs and six species of land snails were found at 21 localities on the Site. The malacofauna of the Site is sparse in comparison to that of other areas in Washington with roughly comparable substrate and climate. Most species found at Hanford are widely distributed forms or are introduced (nonnative) taxa. The Site does have a single endemic land snail, Cryptomastix n. sp., found at a single location. This species likely will be considered a candidate for federal listing. Geologic factors and human modification of spring habitats are the likely causes for the depauperate malacofauna.

27503 (PNL–8656) **Subtidal eelgrass/macroalgae surveys for the proposed breakwaters at the US Coast Guard Station at Ediz Hook, Washington, March 1993.** Shreffler, D.K. (Battelle/Marine Sciences Lab., Sequim, WA (US)). Pacific Northwest Lab., Richland, WA (United States). May 1993. 42p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93016831. Source: OSTI; NTIS; GPO Dep.

In 1993, the US Coast Guard proposed to construct two breakwaters and a debris boom to protect its existing pier and moored vessels inside Ediz Hook in Port Angeles Harbor, Washington. To assist the US Army Corps of Engineers – Seattle District in determining the potential environmental impacts of the proposed breakwaters, Battelle/Marine Sciences Laboratory performed subtidal SCUBA surveys as specified in the Washington Department of Fisheries intermediate eelgrass/macroalgae habitat survey guidelines. The objectives of the subtidal surveys were to (1) quantify the shoot densities of eelgrass; (2) provide percent cover estimates for non-eelgrass macroalgae species; (3) develop a site map indicating the qualitative distribution of eelgrass/macroalgae species,

substrate characterization, approximate depth contours, and the approximate location of the proposed project features; and (4) document the time and date of the surveys, turbidity/visibility, presence of invertebrate/vertebrate species, and anecdotal observations pertinent to habitat characterization of the project site. A total of 14 dives along 12 transects (T1–T12) were successfully completed between March 15 and March 17, 1993. Eelgrass was observed on all of the transects except T7 and T8 at the western debris barrier and T12 along the waterward margin of the existing T-pier. The vicinity of the proposed east breakwater had the highest eelgrass shoot densities (up to 89 shoots/m^2) observed by the divers. Macroalgae and invertebrate species diversity were also highest at the east breakwater site. The low eelgrass densities observed at the west debris barrier site (0 to 14 shoots/m^2) can be attributed mostly to the lack of suitable substrate. The existing layer of wood debris armoring the bottom at the west project site currently limits, and in the areas of heaviest deposition probably precludes, the growth of eelgrass. As was expected, no eelgrass was observed at the south breakwater site.

27504 (PNL-SA–22329) **Diversity and richness of benthic insects in three cold desert spring-streams.** Gaines, W.L. (Pacific Northwest Lab., Richland, WA (United States)); Cushing, C.E. Pacific Northwest Lab., Richland, WA (United States); Washington Univ., Seattle, WA (United States). May 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830 ;AM06-70RL02225. (CONF-9305237–1: Annual meeting of the North American Benthol Society, Calgary (Canada), 25-28 May 1993). Order Number DE93016159. Source: OSTI; NTIS; GPO Dep.

The authors examined species diversity and richness in three cold desert spring-streams, and showed that species diversity was similar and species richness was lower than in similar-size streams from other and or semi-arid regions. Species diversity in the spring-streams increased with increasing stream size and substratum diversity, but declined as distance increased from the nearest large source. However, this latter relationship is difficult to quantify because the nearest large source was the Columbia River, or one of its reservoirs, that has environmental conditions very different from those found in the study streams. It is more likely that the main source of colonizers for the spring-streams studied were other nearby small springs that could provide sources or stepping stone habitats for colonizers. Species diversity declined after winter spates, and the low species diversity and richness values appear to be greatly influenced by these events.

27505 (PNL-SA–22622) **Valuing the salmon resource: Columbia River stocks under climate change and fishery enhancement.** Anderson, D.M.; Scott, M.J. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9304161–1: Northwest Regional Economic conference, Kennewick, WA (United States), 30 Apr 1993). Order Number DE93016160. Source: OSTI; NTIS; GPO Dep.

This paper represents an update to ongoing multidisciplinary research in the area of climate change and associated regional impacts to fisheries and economies. This work particularly deals with the total value of Columbia River salmon and the idea that fish have capital value, articulated here as spawning value. Earlier work dealt solely with the Yakima River spring chinook fishery's response to climate change and fishery enhancement programs and the associated direct economic effects (Anderson et al. 1992). We have expanded our modeling attempts to examine similar impacts in the Grande Ronde River subbasin of the Columbia River basin, and added the summer steelhead stock to the analysis. Relatively recent developments and improvements in climate change modeling and fishery modeling enabled us to attempt such an endeavor.

27506 (RFP–4677) **Application of two real-time toxicity tests to monitor Rocky Flats Plant water quality.** Wolaver, H.; Spence, S.; Paton, I. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. [1993]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. (CONF-9305184–1: 48. annual industrial waste conference, West Lafayette, IN (United States), 10-12 May 1993). Order Number DE93012699. Source: OSTI; NTIS; INIS; GPO Dep.

Rocky Flats Plant (RFP) is part of the Department of Energy (DOE) nuclear weapons complex and fabricated weapon components for the DOE from 1952 to 1989. Like other industrial facilities, RFP is subject to Clean Water Act (CWA) regulations that require surface water discharge monitoring. Unlike most industrial facilities, RFP is also regulated under a Federal Facility Compliance Agreement (FFCA) that requires development of water quality monitoring on a real-time basis. A surface water toxicity monitoring program was initiated in May 1991 to address requirements concerning prevention of toxic effluent discharges. The goal of the program is to determine which methods will provide real-time monitoring, thereby enhancing water management and protection of the aquatic environment downstream. In addition to the traditional whole effluent toxicity (WET) testing required by the FFCA, two other biological instrumentation techniques that may be applicable to real-time monitoring are being implemented. These are the Microtox™ (Microtox™ is a registered trademark of Microbics Corporation, hereinafter referred to as "Microtox") and automated respirometry. Both methods provide frequent sampling compared to WET testing and allow for more timely and frequent water quality measurement.

27507 (SR/H–539) **[Miscellaneous DP Material]: Savannah River biological survey, South Carolina and Georgia, June 1951–May 1952: Final report.** [DP Documents]. Academy of Natural Sciences of Philadelphia, PA (United States). Dept. of Limnology. Feb 1953. 321p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. Order Number DE93013440. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Limnology Department of the Academy of Natural Sciences of Philadelphia made a study of the aquatic life of the Savannah River in the vicinity of the Savnnnah River Plant of the Atomic Energy Commission at the request of E.I. du Pont de Nemours & Company. The purpose of this survey was to establish an objective measure of the aquatic life of the river between Mile 134-175 and of Upper Three Runs so that any significant effect of the industrial or sanitary wastes could be determined in the future. The study was made in 1951–52, and consisted of a summer, a fall, a winter, and a spring survey. Each field team consisted of at least seven people: a chemist, an algologist, an entomologist, an ichthyologist, an invertebrate zoologist, a protozoologist, and a director and coordinator of the survey work. The chemical and bacteriological analyses, and the protozoological determinations were made in the field laboratory. Most of the other determinations were made in the Academy laboratories in Philadelphia. During each of these surveys, four regions on the Savannah River and one region on Upper Three Runs, a small tributary, were studied intensively. This report details the various aspects of the survey.

27508 (UCRL-JC–112367) **Uncertainty estimates in global ocean surface heat fluxes.** Gleckler, P.J. Lawrence Livermore National Lab., CA (United States). Nov 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9210334–2: 17. annual climate diagnostics conference, Norman, OK (United States), 19-23 Oct 1992). Order Number DE93014126. Source: OSTI; NTIS; GPO Dep.

To date the only practical means of estimating large scale ocean surface heat fluxes is with bulk parameterization formulae. It is well known that there are many sources of uncertainties in such estimates due to sampling deficiencies, uncertainties in the field measurements and uncertainties in the parameterizations themselves. This report presents global estimates of the total uncertainties in the climatological annual mean net shortwave (SW), net longwave (LW), latent heat (LH) and sensible heat (SH) ocean surface heat fluxes. The flux estimates used here were compiled by Oberhuber (1988), which utilize the Monthly Summed Trimmed COADS 1950–1979 data.

27509 (VF-UH–93-4) **Mercury content in fish from newly impounded reservoirs.** Frick, K. Vattenfall AB, Vaellingby (Sweden). Dec 1992. 52 p.p. (In Swedish). Order Number DE93500930. Source: OSTI; NTIS; INIS.

During the seventies elevated mercury content in fish was observed in newly created reservoirs although background levels were normal. The initial rise of reservoir mercury levels is probably caused by the dramatically increased amount of organic matter

originating from flooded top-soil and vegetation. Mercury is introduced in the food-chain by methylating bacteria that utilize the surplus of organic matter. This microbial methylation is probably also favoured by reductions in oxygen content and pH that accompanies the decomposition of organic material. It is difficult to make reliable estimates of the duration and maximum levels of the elevated mercury levels since the end result is affected by several biological and chemical processes in combination. Variations may occur on the basis of the type and amount of flooded organic and inorganic material, water chemistry, specific combination of fish and residence time of reservoir water. All available preventive and ameliorating measures are untried in reservoir water bodies, at least in large scale experiments. Vegetation and top-soil stripping could be efficient but also very costly. Liming is a possible method in cases of ongoing or expected acidification. Addition of selenium is a potentially powerful way of lowering the mercury content in fish and this method is well suited to neutral water bodies. Large reductions in fish mercury content have been documented, but since selenium also has been shown to have strong negative effects on biota this method is not yet recommended. (57 refs.).

27510 (VF-UM–93-5) **Chemical modelling of trace elements in pore water from PFBC residues containing ammonia.** Karlsson, L.G. (Kemakta Consultants Co, Stockholm (Sweden)); Brandberg, F. Vattenfall AB, Vaellingby (Sweden). Jan 1993. 33p. Order Number DE93500924. Source: OSTI; NTIS; INIS.

Ammonia is added to the PFBC process with the purpose to reduce the emissions of NO_x in the stack gases. The design of the system for cleaning the stack gases will lead to an increased adsorption of ammonia and an accumulation of soluble ammonium salts in the cyclone ash from PFBC processes. This can be an environmental problem since the amounts will increase over the coming years and there will be a need to dispose the residues. When infiltrating rainwater penetrates the disposed residues ammonia and ammonium salts result in a contamination of the pore water with ammonia in the disposed residues. This entail the solubility of several trace elements in the residues that form soluble complexes with ammonia will increase and cause an increased contamination of groundwater and surface water. In this study the increased solubilities is calculated for the trace elements cadmium, cobalt, copper, mercury, nickel, silver and zinc in the residues using thermodynamical data. The calculations have been performed with probable solid phases of the trace elements at oxidizing and reducing conditions as a function of pH and at varying concentration of ammonia in the pore water. The thermodynamic calculations have been performed with the geochemical code EQ3NR. The results from the calculations show that as a concentration of 17 mg NH_3/l in the pore water of the residues increases the solubilities for copper and silver. If the concentration of ammonia increases to 170 mg NH_3/l will the solubilities increase also for cadmium, nickel and zinc. (12 refs., 39 figs.).

27511 (YJT–92-23) **Saline groundwater in crystalline bedrock: A literature survey.** Lampen, P. (Ekono Energy Ltd., Espoo (Finland)). Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Nov 1992. [96p.] Order Number DE93629317. Source: OSTI; NTIS; INIS.

The State-of-art report describes research made on deep saline groundwaters and brines found in crystalline bedrock, mainly in site studies for nuclear waste disposal. The occurrence, definitions and classifications of saline groundwaters are reviewed with a special emphasis on the different theories concerning the origins of saline groundwaters. Studies of the saline groundwaters in Finland and Sweden have been reviewed more thoroughly. Also the mixing of different bodies of groundwaters, observations of the contact of saline groundwaters and permafrost, and the geochemical modelling of saline groundwaters as well as the future trends of research have been discussed. (orig.).

27512 (YJT–92-30) **Modelling of water-rock interaction at TVO investigation sites: Summary report.** Pitkaenen, P. (Technical Research Centre of Finland, Espoo (Finland). Road, Traffic and Geotechnical Lab.); Snellman, M.; Leino-Forsman, H. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Dec 1992. [101p.] Order Number DE93630668. Source: OSTI; NTIS; INIS.

The geochemistry of the groundwater at the Kivetty, Syyry and Olkiluoto site investigation areas in Finland for nuclear waste disposal is evaluated. The hydrogeological data is collected from boreholes drilled down to 100-m depth into crystalline bedrock. The interpretation is based on groundwater chemistry and isotope data, mineralogical data, and the structure and hydrology of the bedrock, using correlation diagrams and the thermodynamic calculations (PHREEQE,EQ3NR). The hydrogeochemistry and major processes controlling the groundwater chemistry are discussed.

27513 (YJT–93-01) **TVO-Flowmeter.** Rouhiainen, P. (PRG-Tec Oy, Espoo (Finland)). Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Jan 1993. [40p.] Order Number DE93629318. Source: OSTI; NTIS; INIS.

TVO-flowmeter has been field tested in boreholes in the crystalline bedrock. It is possible to measure the groundwater flow both across and along a borehole. Sensitivity is better than 1 ml/h (milliliter per hour) for the flow across the hole. This corresponds the flux value (Darcy velocity) of about $2*10^{-9}$ m/s. The system makes it possible to determine roughly the direction of the flow across the hole. The boreholes in the bedrock change flow conditions. The effects of the borehole and flowmeter-borehole combination are studied by theoretical models. Field examples are presented from flows along and across the hole. The sensitivity of the instrument is demonstrated. Several repeated measurements are presented. Examples are shown of the variation of the flow with time.

27514 (DOE/SR/14069–5) **Establishment of a viable population of red-cockaded woodpeckers at the Savannah River Site: Annual report, FY1992.** Laves, K.S. (Forest Service, Aiken, SC (United States). Southeastern Forest Experiment Station). US-DOE Savannah River Operations Office, Aiken, SC (United States); Forest Service, Aiken, SC (United States). Southeastern Forest Experiment Station. 11 Sep 1992. 13p. Sponsored by USDOE, Washington, DC (United States); Department of Agriculture, Washington, DC (United States). DOE Contract AI09-85SR14069. Order Number DE93015422. Source: OSTI; NTIS; GPO Dep.

The Southeastern Forest Experiment Station (SEFES) began research on the red-cockaded woodpecker (RCW) on the Savannah River Site (SRS) in 1985 with the objective of restoring a viable population. This Project is conducted in cooperation with the Department of Energy, the Savannah River Forest Station (SRFS) and the Savannah River Ecology Laboratory. The program has consisted of two phases. The stabilization phase (1985–1987) focused on preventing the immediate extirpation of the RCW population. During this phase the number of breeding pairs of RCWs increased from one to three, and the total population increased from five to 14 birds. We are currently in the expansion phase (1987-present). To facilitate the population expansion of the RCW at SRS, SEFES and SRFS have implemented numerous research and management activities. These include: control of mid-story vegetation to improve habitat suitability, installation of artificial cavities for RCWS, translocations of RCWs within the SRS and from other populations, maintenance of cavities by installing metal restrictors to discourage cavity competition, and generic research to ascertain the degree of relatedness between individuals and populations.

27515 (DOE/ER/13709–5) **Phytochromes in photosynthetically competent plants: Final report.** Pratt, L.H. Georgia Univ.,

Athens, GA (United States). Dept. of Botany. [1991]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-87ER13709. Order Number DE93015938. Source: OSTI; NTIS; GPO Dep.

Major improvements have been made in the purification of green-oat phytochrome. An effective protease inhibitor has been incorporated, the scale of preparations has been increased greatly, an immunodominant contaminant has been eliminated, and the extent of purification has been increased by at least a factor of ten. Five new MAbs and rabbit PAbs to green-oat phytochrome, as well as rabbit PAbs to a synthetic, putative green-oat phytochrome peptide, have been produced and characterized, together with two MAbs to green-oat phytochrome that had been identified previously. Our earlier hypothesis that green-oat phytochrome itself consists of two types was found to be true. One type of green-oat phytochrome has an apparent monomer size of 125 kDa while the other is 123 kDa. The latter undergoes a Zn^{2+}-induced mobility shift during SDS PAGE and the two phytochromes are immunochemically distinct from one another. Affinity columns prepared with MAbs to green-oat phytochrome have been used to purify 125-kDa green-oat phytochrome to near homogeneity. A proteolytically derived peptide has been isolated from immunopurified green-oat phytochrome and 19 residues have been determined by microsequencing. The results verify that in monocotyledons as well as dicotyledons green- and etiolated-oat phytochromes derive from different genes.

27516 (DOE/ER/20041–1) **Structure and regulation of an archaebacterial promoter: An in vivo study: Progress report, August 1, 1991–March 31, 1993.** Daniels, C.J. Ohio State Univ., Columbus, OH (United States). Dept. of Microbiology. 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER20041. Order Number DE93015782. Source: OSTI; NTIS; GPO Dep.

We have established that a 100 bp DNA fragment from the Haloferax volcanii tRNALys gene directs transcription in vivo. This element served as the starting point for a detailed analysis of the requirements for in vivo transcription. Among several gene tentatively identified as reporter elements, we selected a eukaryotic intron-containing tRNAPro gene for when it is driven by the H. volcanii tRNALys promoter fragment, produces a single small transcript. Transcript analysis, by SI mapping and primer extension, showed that this RNA initiated at the expected tRNALys BoxB sequence and terminated in the tRNAPro RNA Pol III termination element present on the DNA fragment. In initial studies we determined that the 3 inches proximal region of this tRNALys promoter element was sufficient for transcription initiation in vivo. This 40 bp region contains only the BoxA and BoxB regions and short purine rich regions 5 inches to the BoxA and BoxB sequence. Using the tRNAPro gene as the reporter and this minimal promoter, we performed a comprehensive analysis of the BoxA region. Each position of the BoxA region was converted to an four possible nucleotides and the transcription of 36 mutants was quantitated. Among the sites analyzed, only five of the positions showed high levels of discrimination; the preferred BoxA element was 5 inches-$TT(_T/A)(^A/T)$ ANNNN-3 inches. Mutational analysis demonstrated that a transition from T-rich to A-rich sequences in the BoxA element is essential and that there is some flexibility in the location of the "TA" sequence. Additionally the TA sequence appears to determine the location of the transcription start site. The BoxA element defined in this study is similar to those observed for Sulfolobus and the methanogen promoters, and supports the hypothesis that a similar core promoter element is used by all archaeal RNA polymerases.

27517 (DOE/ER/61040–2) **Characterization of the mammalian DNA polymerase gene and protein: Annual progress report.** Mishra, N.C. South Carolina Univ., Columbia, SC (United States). Jan 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-90ER61040. Order Number DE93017270. Source: OSTI; NTIS; GPO Dep.

We have purified and characterized at least three DNA polymerases from Chinese hamster ovary (CHO) cell line KI in order to evaluate the roles of different polymerases in eukaryotic DNA replication. Pol α was the most abundant among different polymerase activities and it was neutralized by a monoclonal antibody raised against human pol α. Pol ε was separated from pol α and pol δ activities using DEAE Sephacell, phosphocellulose and hydroxylapatite columns. The enzyme proved to be sensitive to aphidicolin and carbonyldiphosphonate and was not stimulated by PCNA- Pol δ was the least abundant among the three enzymes. It was sensitive to aphidicolin and carbonyidiphosphonate and was stimulated by PCNA. it had a preference for template/primer poly (dA-dT). Based on DNA sequence data of different eukaryotic polymerases PCR primers complementary to two neighboring synthesized. In PCR experiments several products were obtained which are assumed to be specific for the CHO polymerases. We have also analyzed a large number of aphidicolin resistant mutants of CHO to identify mutants with altered DNA polymerases.

27518 (ORNL/FTR–4175) **[Travel to Japan for collaborative research on DNA repair]: Foreign trip report, September 17–December 30, 1991.** Mitra, S. Oak Ridge National Lab., TN (United States). 8 Jan 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011055. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler was awarded a 3-month Fellowship by the Japan Society for the Promotion of Science for carrying out collaborative research on DNA repair with Prof. M. Ikenaga at the Kyoto University Radiation Biology Center and for visiting several other laboratories with similar research interests. The traveler was appointed as a Visiting Professor in Kyoto University and spent most of his time at the Radiation Biology Center. He supervised T. Kato, a Ph.D. student in Prof. Ikenaga's laboratory, in the cloning and characterization of mammalian genes for DNA repair. He also visited several leading laboratories for DNA repair and mutagenesis studies in Japan. He was invited to give a special lecture at the t Annual Meeting of the Japan Radiation Research Society and was one of five speakers in a symposium marking the anniversary of the Radiation Biology Center and the Department of Experimental Radiology at Kyoto University Medical School. During his stay in Kyoto he made a short trip to Seoul, S. Korea, for delivering a lecture in a special symposium of the Korean Society of Molecular Biology. The overall impression of the traveler is that the molecular biology research in Japan is outstanding in most of the laboratories visited by him. This is perhaps expected. However, the organizational approach of research laboratories is very different from that practiced in the US laboratories. The Japanese laboratories routinely generate very elegant work, but the leading US laboratories appear to be superior in innovative research.

27519 (DOE/ER/60984–3) **Gene sequencing by scanning molecular excitation microscopy: Progress report, June 1990–June 1993.** Kopelman, R. Michigan Univ., Ann Arbor, MI (United States). [1993]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER60984. Order Number DE93017053. Source: OSTI; NTIS; GPO Dep.

We propose to complete the development of scanning molecular excitation microscopy to rapidly sequence DNA. This new type of scanned-tip microscopy is specifically designed to map individual DNA bases in a non-destructive fashion. Base recognition is based on the external heavy atom effect between a heavy atom label on a specific DNA base and a fluorescent sensor molecule at the end of a scanned optical tip. As the tip is scanned very close to the heavy atom its emissions will change intensity and wavelength. For sequencing, heavy-atom labeled single-stranded DNA molecules will be synthesized and oriented on a flat substrate such as mica. An optical tag an one end of each DNA molecule will be rapidly located at low resolution using conventional fluorescence or scanning near-field optical microscopy. Scanning with the same optical tip, the low-resolution path of the DNA will be mapped using long-range interactions such as attractive van der Waals forces or Forester energy transfer. Subsequently, the labeled bases will be mapped at better than 5Å resolution with the same tip using the external heavy atom effect, and the coordinates stored and processed by computer. The proposed microscope could be automated to quickly sequence intact lambda clones, YACK, or genomic Not I fragments, making genomic sequencing much more rapid and economical.

27520 (LA-UR–92-2620) **Los Alamos Science: The Human Genome Project: Number 20, 1992.** Cooper, N.G.; Shea, N. (eds.). Los Alamos National Lab., NM (United States). 1992. 345p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93014410. Source: OSTI; NTIS; GPO Dep.

This article provides a broad overview of the Human Genome Project, with particular emphasis on work being done at Los Alamos. It tries to emphasize the scientific aspects of the project, compared to the more speculative information presented in the popular press. There is a brief introduction to modern genetics, including a review of classic work. There is a broad overview of the Genome Project, describing what the project is, what are some of its major five-year goals, what are major technological challenges ahead of the project, and what can the field of biology, as well as society expect to see as benefits from this project. Specific results on the efforts directed at mapping chromosomes 16 and 5 are discussed. A brief introduction to DNA libraries is presented, bearing in mind that Los Alamos has housed such libraries for many years prior to the Genome Project. Information on efforts to do applied computational work related to the project are discussed, as well as experimental efforts to do rapid DNA sequencing by means of single-molecule detection using applied spectroscopic methods. The article introduces the Los Alamos staff which are working on the Genome Project, and concludes with brief discussions on ethical, legal, and social implications of this work; a brief glimpse of genetics as it may be practiced in the next century; and a glossary of relevant terms.

27521 (BNL–48561) **Summing up: The physics of NCT.** Brugger, R.M. Brookhaven National Lab., Upton, NY (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9309122–1: 5. international symposium on neutron capture therapy, Columbus, OH (United States), 12-17 Sep 1993). Order Number DE93010867. Source: OSTI; NTIS; INIS; GPO Dep.

Neutron Capture Therapy (NCT) is a binary system for treating tumors in which both an agent, usually B-10, and thermal neutrons are directed to a tumor where they combine and release lethal radiation. Directing the agent to the tumor is mainly a chemistry and biology problem, while the production, targeting and effects of the neutrons is mainly a physics problem. This paper briefly describes the, physics side of NCT as presented at this symposium, the neutron beams, the dosimetry and treatment planning, and the element identification. The development of the physical tools and methods are not now limiting the successful demonstration of NCT. Several epithermal neutron beams are available, dosimetry methods are in hand, and treatment planning methods can be ready when required. Methods of identifying elements have been demonstrated, but are not yet widely accessible. New methods could supply valuable additional information about the quantity and location of NCT elements, particularly on the microscopic scale and in vivo.

27522 (DOE/ER/60972–3) **Synthesis and evaluation of boron compounds for neutron capture therapy of malignant brain tumors: Technical progress report No. 1, May 1, 1990–January 31, 1991.** Soloway, A.H.; Barth, R.F. Ohio State Univ. Research Foundation, Columbus, OH (United States). [1990]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER60972. Order Number DE93015880. Source: OSTI; NTIS; GPO Dep.

Boron neutron capture therapy offers the potentiality for treating brain tumors currently resistant to treatment. The success of this form of therapy is directly dependent upon the delivery of sufficient numbers of thermal-neutrons to tumor cells which possess high concentrations of B-10. The objective of this project is to develop chemical methodology to synthesize boron-containing compounds with the potential for becoming incorporated into rapidly-dividing malignant brain tumor cells and excluded from normal components of the brain and surrounding tissues, to develope biological methods for assessing the potential of the compound by use of cell culture or intratumoral injection, to develop analytical methodology for measuring boron in cells and tissue using direct current plasma atomic emission spectroscopy (DCP-AES) and alpha track autoradiography, to develop biochemical and HPLC procedures for evaluating compound uptake and tissue half-life, and to develop procedures required to assess both in vitro and vivo efficacy of BNCT with selected compounds.

27523 (EGG-BNCT–10119) **A benchmark analysis of radiation flux distribution for Boron Neutron Capture Therapy of canine brain tumors.** Moran, J.M. EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1992. 376p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93013698. Source: OSTI; NTIS; INIS; GPO Dep.

Calculations of radiation flux and dose distributions for Boron Neutron Capture Therapy (BNCT) of brain tumors are typically performed using sophisticated three-dimensional analytical models based on either a homogeneous approximation or a simplified few-region approximation to the actual highly-heterogeneous geometry of the irradiation volume. Such models should be validated by comparison with calculations using detailed models in which all significant macroscopic tissue heterogeneities and geometric structures are explicitly represented as faithfully as possible. This work describes a validation exercise for BNCT of canine brain tumors. Geometric measurements of the canine anatomical structures of interest for this work were performed by dissecting and examining two essentially identical Labrador Retriever heads. Chemical analyses of various tissue samples taken during the dissections were conducted to obtain measurements of elemental compositions for tissues of interest. The resulting geometry and tissue composition data were then used to construct a detailed heterogeneous calculational model of the Labrador Retriever head. Calculations of three-dimensional radiation flux distributions pertinent to BNCT were performed for the model using the TORT discrete-ordinates radiation transport code. The calculations were repeated for a corresponding volume-weighted homogeneous tissue model. Comparison of the results showed that the peak neutron and photon flux magnitudes were quite similar for the two models (within 5%), but that the spatial flux profiles were shifted in the heterogeneous model such that the fluxes in some locations away from the peak differed from the corresponding fluxes in the homogeneous model by as much as 10-20%. Differences of this magnitude can be therapeutically significant, emphasizing the need for proper validation of simplified treatment planning models.

27524 (ETDE-IT–93-157) **Combined radiation and hyperthermia: Effects of number of heat fractions and their interval on normal and tumor tissues.** Marino, C.; Cividalli, A. ENEA, Casaccia (Italy). 1992. 25p. Order Number DE93799228. Source: OSTI; NTIS (US Sales Only); INIS.

The effect of one or more heat treatments at 43 degrees C combined with conventional multi-fraction irradiation was studied in murine normal and tumoral tissues in mice. The endpoint of this study was the TCD50 of the C3H mammary carcinoma, inoculated into the foot. For normal tissue, the reaction of the skin of the foot was assessed according to a graded scoring system. Twenty X-ray fractions delivered in 20 or 26 days were combined with 1, 4 or 8 fractions of quasi-simultaneous or sequential hyperthermia (i.e., heat applied 4 hrs after irradiation). The tumor dose response curves show a decrease in TCD50 and in increase in TER linked to the increasing number of heat sessions. A qualitatively similar effect of the number of sessions was observed for the different protocols (quasi-simultaneous and sequential) and for the two overall times. No significant difference was measured between 1 and 4 HT sessions plus 20 fx of RT in the normal tissue damage, while a slight difference was observed between 1, 4 and 8 HT sessions delivered with 20 fractions of RT in 26 days.

This report provides a collection of electronic schematics detailing the lay out and wiring of the Donner 600 Crystal Tomograph.

27526 (LBL–32641-Rev.1) **Interfacing US Census map files with statistical graphics software: Application and use in epidemiology: Revision 1.** Rizzardi, M. (Lawrence Berkeley Lab., CA (United States)); Mohr, M.S.; Merrill, D.W.; Selvin, S. Lawrence Berkeley Lab., CA (United States). Mar 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9207201–1-Rev.1: Statistics and computing in disease clustering, Stony Brook, NY (United States), 23-24 Jul 1992). Order Number DE93013911. Source: OSTI; NTIS; GPO Dep.

In 1990, the United States Bureau of the Census released detailed geographic map files known as TIGER/Line (Topologically Integrated Geographic Encoding and Referencing). The TIGER files, accessible through purchase or Federal repository libraries, contain 24 billion characters of data describing various geographic features including coastlines, hydrography, transportation networks, political boundaries, etc. covering the entire United States. Many of these physical features are of potential interest in epidemiological case studies. Unfortunately, the TIGER database only provides raw alphanumeric data; no utility software, graphical or otherwise, is included. Recently, the S statistical software package has been extended to include a map display function. The map function augments S's high-level approach toward statistical analysis and graphical display of data. Coupling this statistical software with the map database developed for US Census data collection will facilitate epidemiological research. We discuss the technical background necessary to utilize the TIGER database for mapping with S. Two types of S maps, segment-based and polygon-based, are discussed along with methods to construct them from TIGER data. Polygon-based maps are useful for displaying regional statistical data; e.g., disease rates or incidence at the census tract level. Segment-based maps are easier to assemble and appropriate if the data are not regionalized. Census tract data of AIDS incidence in San Francisco (CA) and lung cancer case locations relative to petrochemical refinery sites in Contra Costa County (CA) are used to illustrate the methods and potential uses of interfacing the TIGER database with S.

27527 (LBL–33749) **Performance specifications for proton medical facility.** Chu, W.T. (Lawrence Berkeley Lab., CA (United States)); Staples, J.W.; Ludewigt, B.A.; Renner, T.R.; Singh, R.P.; Nyman, M.A.; Collier, J.M.; Daftari, I.K.; Petti, P.L.; Alonso, J.R.; Kubo, H.; Verhey, L.J. Lawrence Berkeley Lab., CA (United States). Mar 1993. 127p. Sponsored by Department of Health and Human Services, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant CA56932. Order Number DE93015375. Source: OSTI; NTIS; GPO Dep.

Performance specifications of technical components of a modern proton radiotherapy facility are presented. The technical items specified include: the accelerator; the beam transport system including rotating gantry; the treatment beamline systems including beam scattering, beam scanning, and dosimetric instrumentation; and an integrated treatment and accelerator control system. Also included are treatment ancillary facilities such as diagnostic tools, patient positioning and alignment devices, and treatment planning systems. The facility specified will accommodate beam scanning enabling the three-dimensional conformal therapy deliver.

The traveler worked on off-site assignment at the Clinic for Nuclear Medicine at the University of Bonn, Germany, for a one-year period through support as a Senior American Scientist of the Alexander von Humboldt Foundation of Germany. He also attended and presented invited lectures at the XIIIth Congress of the European Society of Cardiology in Amsterdam, the Netherlands, the European Association of Nuclear Medicine Congress in Vienna, Austria, the Southeastern Chapter of the Society of Nuclear Medicine in Miami Beach, Florida, the International Congress on Neuroimaging in Psychiatry in London, England, the Second Mediterranean Symposium on Nuclear Medicine and Radiopharmaceuticals in Athens, Greece, and the ALASBIMN Nuclear Medicine Congress in Madrid, Spain.

27529 (ORNL/TM–12375, pp. 12-26) **A self-learning Bayesian Expert System.** Alemi, F. (Cleveland State Univ., OH (US)); Bhatt, P.; Eisenstein, E.; Fadlalla, A.; Stephens, R.; Butts, J. Oak Ridge National Lab., TN (United States). May 1993. (CONF-9306151–: 7. international symposium on methodologies for intelligent systems, Trondheim (Norway), 15-18 Jun 1993). In *Proceedings of the Seventh International Symposium on Methodologies for Intelligent Systems (Poster Session).* 174p. Order Number DE93013470. Source: OSTI; NTIS.

This paper presents a Bayesian Expert System (B.E.St.). This system is different from other forms of supervised machine learning in that it induces likelihood ratios from a set of cases. B.E.St. provides unique methods for managing conditional dependencies, for selecting questions to use in its models, and for predicting events when given responses that are not contained in its original set of cases. 29 refs., 3 figs., 3 tabs.

27530 (ORNL/TM–12375, pp. 44-54) **Competence-switching managed by intelligent systems.** Egger, E. (Technical University of Vienna (AT)); Hanappi, H. Oak Ridge National Lab., TN (United States). May 1993. (CONF-9306151–: 7. international symposium on methodologies for intelligent systems, Trondheim (Norway), 15-18 Jun 1993). In *Proceedings of the Seventh International Symposium on Methodologies for Intelligent Systems (Poster Session).* 174p. Order Number DE93013470. Source: OSTI; NTIS.

This article deals with problems of time-management and the coordination of activities of heterogeneous agents. To support the planning of strongly interwoven jobs more than a pure scheduling algorithm is needed: Since hierarchical power-relations, diverging objective functions and unequally distributed decision competencies prohibit any straight-forward solution, a more complex framework switching between computer support and face-to-face decisions is more adequate. The issues are discussed in the context of hospital organization, in particular for the example of surgery-planning. 16 refs., 4 figs.

27531 (SSI–92-02) **Sensitivity of screen-film systems.** Sandborg, M. (Lunds Lasarett (Sweden). Avd. f Sjukhusfysik); Nilsson, Goergen; Holje, G. Swedish Radiation Protection Inst., Stockholm (Sweden). Jan 1992. [17p.] (In Swedish). Order Number DE93630856. Source: OSTI; NTIS; INIS.

This report, which has been funded by SSI, presents sensitivity data on the 'second generation' of modern intensifying screens, commercially available at the onset of the investigation. The sensitivity of the screen-film systems was evaluated with 80 kV tube potential and a total filtration of 3.0 mm Al. 20 mm aluminum was used for simulating human tissue, since it gives the same HVL_x, as does 25 cm water. Kerma in air, needed to produce a net film density of 1.00 was determined and its inverse, expressed in mGy^{-1}, was taken as an indicator of the sensitivity; here called the sensitivity class of a screen-film system.

27532 Clay enhancement of methane, low molecular weight hydrocarbon and halocarbon conversion by methanotrophic bacteria. Apel, W.A.; Dugan, P.R. To Dept. of Energy. 1991. USA

patent application 7-738,001. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93015728. Source: OSTI; NTIS; GPO Dep.

The invention described in this report relates to a combined system of an apparatus and a method of increasing the rates of oxidation of gases and hazardous vapors by methanotrophic and other bacteria. The gases of interest are methane and trichlorethylene and other hazardous vapors. In a preferred embodiment, the oxidation rate of methane is improved by the addition of clays, e.g., kaolin, sometimes called "China clay."

The Comprehensive Epidemiologic Data Resource (CEDR) and Populations at Risk to Environmental Pollution (PAREP) projects, of the Information and Computing sciences Division (ICSD) at Lawrence Berkeley Laboratory (LBL), are using public socioeconomic and geographic data files which are available to CEDR and PAREP collaborators via LBL's computing network. At this time 89 CD-ROM diskettes (approximately 45 gigabytes) are on line via the Unix file server cedrcd.lbl.gov. Most of the files are from the US Bureau of the Census, and many of these pertain to the 1990 Census of Population and Housing. All the CD-ROM diskettes contain documentation in the form of ASCII text files. In addition, printed documentation for most files is available for inspection at University of California Data and Technical Assistance (UC DATA), tel. (510) 642-6571, or the UC Documents Library, tel. (510) 642-2569, both located on the UC Berkeley Campus. Many of the CD-ROM diskettes distributed by the Census Bureau contain software for PC compatible computers, for easily accessing the data. Shared access to the data is maintained through a collaboration among the CEDR and PAREP projects at LBL, and UC DATA, and the UC Documents Library. LBL is grateful to UC DATA and the UC Documents Library for the use of their CD-ROM diskettes. Shared access to LBL facilities may be restricted in the future if costs become prohibitive. Via the Sun Network File System (NFS), these data can be exported to Internet computers for direct access by the user's application program(s). Due to the size of the files, this access method is preferred over File Transfer Protocol (FTP) access.

27534 (AECS-A/FRSR–67) **Effects of gamma radiation on faba bean seed beetle Bruchus Dentipes Bande.** Mansour, Mohammed (Atomic Energy Commission, Damascus (Syrian Arab Republic)); Al-Bachir, Mahfouz. Atomic Energy Commission, Damascus (Syrian Arab Republic). Apr 1993. [26p.] (In Arabic). Order Number DE93630771. Source: OSTI; NTIS (US Sales Only); INIS.

Faba bean, Vivia bata, is one of the most important agricultural legume plants in Syria. Like any other crop, it is attacked by several insect pests. The most important of these is the faba bean seed beetle, Bruchus Dentipes Baudi. Infestation occurs only in the field and the major source of infestation is infested seed used for planting. The average infestation rate is about 45% and this reduces the economic value of the seeds to less than 50%. Chemical control in the field is effective but too expensive. Treating seeds in storage with fumigants is not as effective as it used to be, probably because of the pest developing resistance. Biological control has been investigated but their is no practically acceptable biological control agent at present. The lack of an effective biological control agent and/or economically acceptable and environmentally sound chemical control has led us to investigate the possibility of using gamma radiation to disinfest faba bean seeds as soon as possible after harvest when the insect is still in its early development stages. Infested faba bean seeds were treated immediately after harvest with 4 levels of gamma radiation ranged from 30 to 120 Gy with 30 Gy intervals. Treatment was repeated 15 and 30 days later and the effect of gamma radiation on larval survival was evaluated. The results showed that 90 Gy was sufficient to stop larval development and cause a 100% mortality. This dose, however, affected negatively seed germination. These results indicate that it is possible to disinfest faba bean seeds stored for human consumption with 90 Gy of gamma radiation. However, seeds destined for planting can not be treated with this dose. (author). 35 refs., 6 tabs., 2 figs.

27535 (AECS-A/RRE–9) **Accumulation of dry matter and nitrogen in the developing seeds of high protein mutant lines of Triticum Aestivum (L.) produced by the IAEA.** Mir Ali, N. (Atomic Energy Commission, Damascus (Syrian Arab Republic). Dept. of Radiation Agricuture); Nabulsi, I. Atomic Energy Commission, Damascus (Syrian Arab Republic). Mar 1993. [14p.] (In Arabic). Order Number DE93630765. Source: OSTI; NTIS (US Sales Only); INIS.

Accumulation patterns of dry matter and nitrogen in the developing seeds of nine mutant lines produced by the IAEA and their mother Triticum Aestivum (L.) line were studied. The experiments lasted 2 years under rain fed conditions. Significant differences were found among the lines in dry matter and nitrogen rates, and periods of accumulation, whereas no significant differences were found in the final seed weight of the lines. The highest rates of accumulation for dry matter and nitrogen were accompanied with the shortest period of accumulation in two late flowering mutant lines. However, these two lines were the lowest in their yield per plot. The other mutant lines achieved the high nitrogen percentage in their seeds through the relative reduction in dry matter accumulation rate compared to their mother line rather than through higher rate of nitrogen accumulation. This study revealed some of the potential reasons behind the higher percentage of protein in the seeds of the mutant lines under investigation. (author). 17 refs., 3 figs., 2 tabs.

27536 (AECS-A/RRE–10) **A study on the effect of low doses gamma radiation on mushroom spawn.** Ajlouni, Said (Atomic Energy Commission, Damascus (Syrian Arab Republic)). Atomic Energy Commission, Damascus (Syrian Arab Republic). Mar 1993. [10p.] (In Arabic). Order Number DE93630763. Source: OSTI; NTIS (US Sales Only); INIS.

Mushroom spawn (Hybrid-521) was irradiated at room temperature using low doses of gamma radiation (50-600 rad). The spawn was then planted at two stages; first, after 24 hours of irradiation, and second after storage for three weeks at refrigeration temperature. Results of this study showed that the applied doses of gamma radiation did not have any stimulatory effect on mushroom growth or productivity. It was also noticed that mushroom production rate decreased when irradiated spawn was stored for three weeks prior to planting, as compared with spawn planted 24 hours after irradiation. (author). 18 refs., 2 figs., 2 tabs.

27537 (AECS-A/RRE–11) **Determination of gamma ray doses suitable for mutation induction in garlic (Allium sativum L.).** Al-Safadi, Bassam (Atomic Energy Commission, Damascus (Syrian Arab Republic)); Ayyoubi, Zouhair. Atomic Energy Commission, Damascus (Syrian Arab Republic). Apr 1993. [11p.] (In Arabic). Order Number DE93630764. Source: OSTI; NTIS (US Sales Only); INIS.

Garlic (Allium sativum L.) cloves were exposed to different doses of gamma radiation (Control, 100, 250, 500, 750, and 1000 rads). The cloves were planted in 4 replicates at Deer Alhajar station of the Dept. of Radiation Agriculture. Number of surviving plants was recorded at 2 months after planting and at harvest. Length of foliage was measured at harvest time and weight of cloves was taken two weeks after harvest. Visual readings in the field on plant shape and leaf color were also taken. The results indicated a negative effect of gamma radiation on plant survival especially at doses of 750 and 1000 rads where no plants survived until harvest. Plant length and clove weight were reduced even at 500 rad dose. Percentage of yellow and necrotic plants increased with increasing gamma ray

dosage. No stimulation of plant growth was noticed as a result of irradiation with low doses of gamma rays. Treatment with 500 rads of gamma radiation was considered the best among tested doses for garlic mutagenesis (Using cloves) since it gave acceptable rate of survival and morphologic variation. (author). 14 refs., 4 figs.

27538 (AECS-A/RSS–50) **Effect of gamma radiation on garlic storage under natural conditions.** Ayyoubi, Zouhair (Atomic Energy Commissiom, Damascus (Syrian Arab Republic)); Sharabi, N.E. Atomic Energy Commission, Damascus (Syrian Arab Republic). Feb 1993. [17p.] (In Arabic). Order Number DE93630775. Source: OSTI; NTIS (US Sales Only); INIS.

Garlic cloves were exposed to 30, 60, and 100 Gy of gamma radiation using Co^{60} as a sources, to study the effect of different doses on the sprout inhibition of garlic. All the doses applied were effective. No sprout occurred in any of the treatments subjected to natural storage conditions. The effect of irradiation was evident in limiting the weight decrease. It reached 12 - 19% in 1987 and 1988 experiments respectively after 320 days of storage. Irradiation had no effect on the garlic consumptive specifications compared to the control. (author). 4 refs., 2 figs., 5 tabs.

27539 (AECS-A/RSS–54) **Radioimmunoassay and other related techniques.** Zarkawi, Moutaz (Atomic Energy Commission, Damascus (Syrian Arab Republic)). Atomic Energy Commission, Damascus (Syrian Arab Republic). Apr 1993. [42p.] (In Arabic). Order Number DE93630785. Source: OSTI; NTIS (US Sales Only); INIS.

The article reviews principles, requirements and reliability criteria of radioimmunoassay (RIA). Since basic reactions involved in RIA and related techniques are derived from reactions which take place in the immune system (IS) of humans and animals, the IS and the way it works will be described. In addition to RIA which involves the use of isotopes as tracers (labels), other non-radioisotopic and recent immunoassay techniques i.e. enzyme-linked immunosorbent assay (ELISA), chemiluminescence immunoassay (CLIA) and fluoroimmunoassay (FIA) will be dealt with. Some important and related terms will be defined and explained. (author). 59 refs., 4 figs.

27540 (DOE/CE/15474–T3) **Mikkelson sweep/spike chisel plow shovel: Economic summary of the 1992 crop season.** North Dakota State Univ., Langdon, ND (United States). Langdon Research Center. [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-91CE15474. Order Number DE93015634. Source: OSTI; NTIS; GPO Dep.

Profitability comparisons are reported between the Mikkelson Sweep/Spike Chisel Plow Shovel standard sweeps. This evaluation covers the first year of testing of the new Sweep/Spike design. The data are not averaged over treatments due to significant interaction between treatments and environmental factors. The cost of fuel, fall and spring, to perform the various treatments ranged from $1.27 to $3.36 per acre. Use of the sweep/spike shovel always reduced total fuel cost. Savings varied from $0.11 to $0.71 per acre depending on prior treatment. This means there will be money saved, to off-set expenses, when converting present chisel plows or for special options on new chisel plows, needed for use of the sweep/spike shovel. A summary of 1991–1992 energy measurements. They indicate that more power will be required to pull a chisel plow equipped with the sweep/spike shovel. A larger tractor, narrower chisel plow and/or slower speed will be required to avoid the wheel slippage problems encountered on soft or wet field surfaces.

27541 (DOE/ER/20037–2) **Mechanisms and genetic control of interspecific crossing barriers in Lycopersicon: Second yearly progress report.** Mutschler, M.A. (Cornell Univ., Ithaca, NY (United States)); McCormick, S. Cornell Univ., Ithaca, NY (United States). 27 Mar 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER20037. Order Number DE93015931. Source: OSTI; NTIS; GPO Dep.

This study employs Lycopersicon esculentum and L. pennellii as model systems to study the interspecific reproductive barriers unilateral incongruity (UI), hybrid breakdown and interspecific aberrant ratio syndrome (IARS).

27542 (IAEA-TECDOC–695, pp. 19-31) **Behaviour of endosulfan in a model rice-fish ecosystem.** Jebakumar, S.R.D. (Madurai Kamaraj Univ., Madurai (India). Dept. of Biotechnology); Jayaraman, J. International Atomic Energy Agency, Vienna (Austria). Mar 1993. (CONF-9111316–: Final research co-ordination meeting on use of isotopes in studies of pesticides in rice-fish ecosystems, Bangkok (Thailand), 11-15 Nov 1991). In *Use of isotopes in studies of pesticides in rice-fish ecosystems: Report of a final research co-ordination meeting held in Bangkok, Thailand, 11-15 November 1991.* [130p.] Order Number DE93629395. Source: OSTI; NTIS (US Sales Only); INIS.

The levels of endosulfan deposited on rice plant leaves were low compared to reported field values. Even these values reduced to very low levels (75% or 0.06 mg/kg) in about 11 days. The half-life was 5 days. Endosulfan was strongly bound to the soil and extractability was very low. The compound percolated from the field area through soil at the rate of about 5μg cm^{-1} day^{-1}. Metabolism takes place in the soil; endosulfan sulfate and alcohol were detected. However, no stoichiometric relationship could be derived. There was also variation in the concentrations of α and β isomers, but specific correlation was not possible. There was no tendency to bioaccumulation. Endosulfan ether was detected in Hydrilla verticillata. (author). 9 refs, 5 figs, 6 tabs.

27543 (IAEA-TECDOC–695, pp. 33-45) **Fate of endosulfan in a rice-fish ecosystem.** Barredo Medina, M.J. (University of the Philippines, Los Banos (Philippines). Pesticide Toxicology and Chemistry Lab.); Calumpang, S.M.F.; Tejada, A.W.; Medina, J.R.; Magallona, E.D. International Atomic Energy Agency, Vienna (Austria). Mar 1993. (CONF-9111316–: Final research co-ordination meeting on use of isotopes in studies of pesticides in rice-fish ecosystems, Bangkok (Thailand), 11-15 Nov 1991). In *Use of isotopes in studies of pesticides in rice-fish ecosystems: Report of a final research co-ordination meeting held in Bangkok, Thailand, 11-15 November 1991.* [130p.] Order Number DE93629395. Source: OSTI; NTIS (US Sales Only); INIS.

The persistence of endosulfan in a rice field and its potential for adverse effects on rice-fish culture, was evaluated. Endosulfan was applied at the rate of 0.5 kg. AI/ha 30 days after transplanting. Residues were at a maximum at 2 h. Degradation of total residues followed pseudo-first order kinetics with half-lives of 1.2, 1.3 and 1.0 day in paddy soil, water and rice leaves, respectively. In paddy soil, maximum residues were 0.48 and 0.58 mg/kg for the alpha- and beta- isomers, respectively. In paddy water, the maxima for both alpha- and beta- isomers were 0.12 ug/L. In the rice leaves, the maxima for alpha- and beta- endosulfan were 2.75 and 1.56 mg/kg, respectively. Both the alpha- and beta- isomers dissipated at similar rates and did not accumulate in these substrates. The residues in water were still toxic to Oreochromis mossambicus up to 18 days after spraying (17% mortality). In fish, the bioconcentration factor was determined to be 9 (head) and 82 (flesh) for the alpha-isomer and 171 (head) and 279 (flesh) for the beta-isomer. (author). 18 refs, 6 figs, 2 tabs.

27544 (IAEA-TECDOC–695, pp. 47-51) **Residues of ^{14}C-endosulfan in plant, soil, and water of a rice ecosystem.** Gonzales, B.P. (University of the Philippines, Diliman, Quezon City (Philippines). Natural Sciences Research Inst.); Bello, F.B.B. International Atomic Energy Agency, Vienna (Austria). Mar 1993. (CONF-9111316–: Final research co-ordination meeting on use of isotopes in studies of pesticides in rice-fish ecosystems, Bangkok (Thailand), 11-15 Nov 1991). In *Use of isotopes in studies of pesticides in rice-fish ecosystems: Report of a final research co-ordination meeting held in Bangkok, Thailand, 11-15 November 1991.* [130p.] Order Number DE93629395. Source: OSTI; NTIS (US Sales Only); INIS.

Alpha- and beta-^{14}C-endosulfan residue data were generated from experiments conducted in a model rice-fish ecosystem. All fish put into the ecosystem ten days after spraying died within twenty-four hours. Replacements continued to die until six weeks after spraying beta-endosulfan and until five weeks after spraying alpha-endosulfan. However, a rapid decline in ^{14}C-activity with time was observed in all the components of the ecosystem. At harvest time, grain contained ^{14}C-level equivalent to less than 0.001 mg/kg of alpha- and beta- endosulfan while fish contained ^{14}C equivalent to 0.002 mg/kg alpha- and beta-endosulfan. If fish are to be

cultivated in an endosulfan-treated farm, they will have to be introduced at least six weeks after spraying. If it is necessary to spray repeatedly, then it will not be feasible to raise fish in these paddies unless an alternative insecticide is used. (author).

27545 (IAEA-TECDOC–695, pp. 53-63) **Distribution and effect of ^{14}C-endosulfan in a rice paddy-fish microecosystem.** Tayaputch, N. (Department of Agriculture, Bangkok (Thailand). Div. of Agricultural Toxic Substances); Kamnerdman, A.; Chawengsri, V. International Atomic Energy Agency, Vienna (Austria). Mar 1993. (CONF-9111316–: Final research co-ordination meeting on use of isotopes in studies of pesticides in rice-fish ecosystems, Bangkok (Thailand), 11-15 Nov 1991). In *Use of isotopes in studies of pesticides in rice-fish ecosystems: Report of a final research co-ordination meeting held in Bangkok, Thailand, 11-15 November 1991.* [130p.] Order Number DE93629395. Source: OSTI; NTIS (US Sales Only); INIS.

The experiment was conducted to evaluate the behaviour of endosulfan in a simulated rice-paddy-fish simulating ecosystem. ^{14}C-endosulfan sprayed directly on rice plant was absorbed more by the shoot than the root and endosulfan sulfate was the major metabolite found at all growth stages. ^{14}C-endosulfan was highly toxic to fish causing 100% mortality from day 1 after spraying to 14 days. The α and β isomers of ^{14}C-endosulfan degraded rapidly into endosulfan sulfate. α-Endosulfan degraded faster than the β -isomer in water and rice plants whereas β -isomer was faster in soil. (author). 5 refs, 2 figs, 7 tabs.

27546 (IAEA-TECDOC–695, pp. 65-71) **Metabolism of ^{14}C-endosulfan in carp (Cyprinus carpio L).** Suh Yongtack (Chonnam National Univ., Kwangju (Korea, Republic of). Dept. of Agricultural Chemistry); Shim Jaehan; Lee Kangbong. International Atomic Energy Agency, Vienna (Austria). Mar 1993. (CONF-9111316–: Final research co-ordination meeting on use of isotopes in studies of pesticides in rice-fish ecosystems, Bangkok (Thailand), 11-15 Nov 1991). In *Use of isotopes in studies of pesticides in rice-fish ecosystems: Report of a final research co-ordination meeting held in Bangkok, Thailand, 11-15 November 1991.* [130p.] Order Number DE93629395. Source: OSTI; NTIS (US Sales Only); INIS.

Fish (Cyprinus carpio L.) were treated with LC_{10} concentration 4.49 ng/ml of ^{14}C-endosulfan to study the absorption and metabolism. In an in vivo test, endosulfan was metabolized (65-80 %) in the tissues, only the endosulfan ether was identified indicating that it is the main metabolite of detoxification in carp. However, in an in vitro test endosulfan was converted to the endosulfan α-hydroxyether, endosulfan alcohol and endosulfan ether. The maximum levels of ^{14}C in head, muscle, and gut occurred after 8 h exposure. However, the maxima were reached in liver and kidney after 15 min, 3 h respectively. Radioactivity in the tissue decreased rapidly during 8 h after treatment. The amount of total recovered ^{14}C-activity in liver, kidney and muscle of fish was about 80-90 % during the 8 h after application. The non-extractable radioactivity increased after 8 h exposure (27-31%). When endosulfan was incubated with fish liver, kidney and gut preparations, it was metabolized to watersoluble and organosoluble metabolites. The addition of NADPH resulted in rapid conversion of endosulfan to the metabolites in an in vitro test. The rate of metabolism of endosulfan in liver, kidney and gut supplemented with NADPH as a cofactor was high in the 105,000 g soluble fraction than in microsomes. (author). 9 refs, 3 figs, 4 tabs.

27547 (IAEA-TECDOC–695, pp. 73-81) **Residues of monocrotophos in a simulated model system.** Jebakumar, S.R.D. (Madurai Kamaraj Univ., Madurai (India). Dept. of Biotechnology); Jayaraman, J. International Atomic Energy Agency, Vienna (Austria). Mar 1993. Contract 5391/R1/RB. (CONF-9111316–: Final research co-ordination meeting on use of isotopes in studies of pesticides in rice-fish ecosystems, Bangkok (Thailand), 11-15 Nov 1991). In *Use of isotopes in studies of pesticides in rice-fish ecosystems: Report of a final research co-ordination meeting held in Bangkok, Thailand, 11-15 November 1991.* [130p.] Order Number DE93629395. Source: OSTI; NTIS (US Sales Only); INIS.

Monocrotophos applied to the soil showed immediate translocation in IR-20 rice plant and it was maximum on 14th day. Release of residues in the soil into water was very slow. Accumulation of monocrotophos in fish was maximum on 28th day, thereafter the residue decreased gradually. (author). 4 refs, 4 figs, 2 tabs.

27548 (IAEA-TECDOC–695, pp. 83-93) **Fate of chlorpyrifos in a model rice-fish ecosystem.** Barredo Medina, M.J. (University of the Philippines, Lost Banos (Philippines). Pesticide Toxicology and Chemistry Lab.); Calumpang, S.M.F.; Tejada, A.W.; Medina, J.R.; Magallona, E.D. International Atomic Energy Agency, Vienna (Austria). Mar 1993. (CONF-9111316–: Final research co-ordination meeting on use of isotopes in studies of pesticides in rice-fish ecosystems, Bangkok (Thailand), 11-15 Nov 1991). In *Use of isotopes in studies of pesticides in rice-fish ecosystems: Report of a final research co-ordination meeting held in Bangkok, Thailand, 11-15 November 1991.* [130p.] Order Number DE93629395. Source: OSTI; NTIS (US Sales Only); INIS.

The persistence and distribution of chlorpyrifos in a model rice-fish ecosystem and its potential for use on rice-fish culture were evaluated. Chlorpyrifos applied at the rate of 0.5 kg AI/ha had a half-life of 3.7 days in paddy water with maximum residues of 0.009 mg/Lat 2 Days After Spraying (DAS). In paddy soil, a maximum residue of 1.2 mg/kg was found 1 DAS. Chlorpyrifos residues obtained by ordinary and exhaustive extraction had half-lives of 1.7 and 2.8 days, respectively. Bound residues started to accumulate at 19 DAS. Residues were found below 20 cm in the paddy soil at 6 DAS. Residues decline in the leaves, stems and roots followed pseudo-first order kinetics with half-lives of 0.9, 1.5 and 1.2 days, respectively. Residues were not detected in the grain at harvest. They did not bioaccumulate in fish and were not toxic to Oreochromis niloticus 6 DAS. (author). 13 refs, 2 figs, 5 tabs.

27549 (IAEA-TECDOC–695, pp. 95-102) **Research on fate of fenitrothion in a rice/fish/azolla ecosystem.** Sun, J.H. (Zhejiang Agricultural Univ., Hangzhou (China). Inst. of Nuclear-Agricultural Sciences); Li, X.M.; Chen, D.F.; Chen, Z.Y. International Atomic Energy Agency, Vienna (Austria). Mar 1993. (CONF-9111316–: Final research co-ordination meeting on use of isotopes in studies of pesticides in rice-fish ecosystems, Bangkok (Thailand), 11-15 Nov 1991). In *Use of isotopes in studies of pesticides in rice-fish ecosystems: Report of a final research co-ordination meeting held in Bangkok, Thailand, 11-15 November 1991.* [130p.] Order Number DE93629395. Source: OSTI; NTIS (US Sales Only); INIS.

The fate of ^{14}C-fenitrothion was studied in a rice/fish/azolla ecosystem. Most of the applied fenitrothion was intercepted by plants and decreased with time. Fenitrothion residues in the flesh of fish were low and most of them were in the bound form. Fenitrothion concentration in water decreased rapidly with the formation of water soluble products. In soil, most of the fenitrothion was retained in the upper layer largely as bound residues. At harvest, the concentration of fenitrothion in cargo rice and flesh of fish were very low, much lower than the permitted maximum residue level, 0.2mg/kg for rice (in China), 1μg/kg for rice (codex Alimentarus), and 0.05 mg/Kg for flesh of fish (in Japan). Fenitrothion residues in early season rice-fish-azolla ecosystems had little effect to the next paddy field. (author). 3 refs, 6 tabs.

27550 (IAEA-TECDOC–695, pp. 103-110) **Residues of ^{14}C-fenitrothion in a model paddy-fish ecosystem.** Zhang Zhongliang (Sichuan Agricultural Univ., Sichuan (China). Isotope Research Lab.); Wang Huaxin; Guo Dazhi; Chen Zhiyu; Wu Suchueng. International Atomic Energy Agency, Vienna (Austria). Mar 1993. (CONF-9111316–: Final research co-ordination meeting on use of isotopes in studies of pesticides in rice-fish ecosystems, Bangkok (Thailand), 11-15 Nov 1991). In *Use of isotopes in studies of pesticides in rice-fish ecosystems: Report of a final research co-ordination meeting held in Bangkok, Thailand, 11-15 November 1991.* [130p.] Order Number DE93629395. Source: OSTI; NTIS (US Sales Only); INIS.

The distribution of ^{14}C-fenitrothion residues in a model paddy-fish ecosystem was studied. The pesticide was sprayed over the rice plants at two level: 116 mg A l/tank, 8288 kBq (as X dose) and 232 mg A l/tank, 16576 kBq (as 2X dose). The results from the study showed that the residues of the pesticide in paddy water and rice stems and leaves decreased with time, and those in the soil, rice roots and fish body increased soon after application and decreased thereafter. At harvest (77 days after pesticide application), ^{14}C residues in different components of the ecosystem expressed

as fenitrothion were: upper part of the soil: 0.50 ± 0.061 mg/kg (2X dose) and 0.27 ± 0.007 mg/kg (X dose); lower part of the soil: 0.099 ± 0.001 mg/kg (2X) and 0.038 ± 0.003 mg/kg (X); rice stems and leaves: 4.24±0.085 mg/kg (2X) and 1.78 ±0.14 mg/kg (X); brown rice: 2.10±0.15 mg/kg (2X) and 0.96±0.063 mg/kg (X); fish body: 4.34±0.30 mg/kg (2X) and 2.75±0.025 mg/kg (X); and paddy water: 2.70±0.1 μ g/L (2X). About 60-90 % of the pesticide residue in the soil and rice plants existed in bound form and tended to increase with time. No toxicity to the fish was observed when the 2X dose of the pesticide had been applied which implies that the tested dose of fenitrothion could be used safely in the paddy-fish ecosystem. (author). 5 refs, 5 tabs.

27551 (IAEA-TECDOC–695, pp. 111-117) **Study on residues of ^{14}C-Fenitrothion in a model rice-fish ecosystem and in a field rice-fish ecosystem.** Zhang Zhongliang (Sichuan Agricultural Univ., Sichuan (China). Isotope Research Lab.); Wang Huaxin; Guo Dazhi; Chen Zhiyu; Wu Suchueng. International Atomic Energy Agency, Vienna (Austria). Mar 1993. Contract 5389/RBI. (CONF-9111316–: Final research co-ordination meeting on use of isotopes in studies of pesticides in rice-fish ecosystems, Bangkok (Thailand), 11-15 Nov 1991). In *Use of isotopes in studies of pesticides in rice-fish ecosystems: Report of a final research co-ordination meeting held in Bangkok, Thailand, 11-15 November 1991.* [130p.] Order Number DE93629395. Source: OSTI; NTIS (US Sales Only); INIS.

Residues of ^{14}C-fenitrothion in a model rice-fish ecosystem and field rice-fish ecosystem were studied. When equal amounts of the pesticide were applied, the extractable residues in brown rice (equivalent to 34.3±1.9 μg/kg fenitrothion) and rice stems and leaves (20.9±1.5 μg/kg) of the model rice-fish ecosystem were 10-15 times higher than that of the field rice-fish ecosystem (4.48±0.13 μg/kg and 1.27±0.34 μg/kg respectively). Residues in upper part of the soil (6.50±0.1–8.10±0.2 μg/kg) and lower part of the soil (1.30±0.1–1.50±0.1 μg/kg) of the model rice-fish ecosystem were 10-40 times higher than that of the field rice-fish ecosystem (0.17±0.01 μg/kg). The extractable residues in paddy water of the model ecosystem (0.30 ± 0.01 μg/kg) were similar to that of the field ecosystem (0.20±0.02 μg/kg). When the fenitrothion was sprayed on the rice plants, residues in brown rice, fish body, soil and paddy water were lower than those when the pesticide was spread on the surface of the soil. (author). 4 refs, 2 tabs.

27552 (IAEA-TECDOC–696, pp. 97-106) **Detection methods for irradiated foods - review of current developments.** Hayashi, T. (National Food Research Inst., Tsukuba, Ibaraki (Japan)). World Health Organization, Manila (Philippines). Regional Office for the Western Pacific; Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Mar 1993. Source: OSTI; NTIS (US Sales Only); INIS.

The identification of irradiated foods is important for authorities, consumers, traders and the food industry. It is difficult to determine whether unlabelled foods have been irradiated or not. It is recommended that irradiated foods should be clearly labelled as such, but there is nevertheless a need for reliable methods to detect irradiated foods. This article reviews some detection methods, especially electron spin resonance, and luminescence, although other physical, chemical and biological methods are also discussed.

Source: OSTI; NTIS (US Sales Only); INIS.

Food production and marketing are being transformed by urbanization, technological change, consumer demands, regulatory requirements and increasing interdependence among countries and regions. In every country, the agri-food sector is a large, vital component of economic development, both in national and international terms. Within this changing environment, the commercialization of new agri-food technologies is becoming more difficult and challenging. Food irradiation appears to be facing similar objections to those experienced by "pasteurization" many decades ago. However, a general consensus has been achieved among governments that irradiation, from gamma or electron sources, can contribute positively to food security, safety and global food trade. Intergovernmental collaboration has lead to standards, codes of practice, guidelines, training and good sources of information on food irradiation. Wise application of these resources in an open manner will lead to the successful introduction of new food irradiation facilities and to global trade in irradiated foods. The addition of irradiation preservation to existing food technologies will broaden our overall capability to maintain agricultural and fisheries produce in a safe condition and, as well, to market quality products. (author). 10 refs.

27554 (IAEA-TECDOC–696, pp. 27-31) **The contribution of food irradiation to food safety and security.** Kaferstein, F. (World Health Organization, Geneva (Switzerland). Food Safety Unit). One of the objectives of the World Health Organization (WHO) is to assist efforts throughout the world to provide safe and nutritious food supplies. However, the safety and nutritional quality, as well as the mere availability of our food, is constantly threatened by contamination, infestation and deterioration. Efforts to reduce the devastating consequences of food spoilage and foodborne disease started well before the first written records. Probably the first method ever used, and one still widely employed throughout the world today, was sun-drying - simple, cheap and highly effective. In the course of tens of thousands of years, people have discovered many other methods of preserving food - salting, cooking, smoking, fermentation, canning, freezing, and preservation by chemicals. The most recent addition to this list is irradiation, i.e. the exposure of foods to carefully measured amounts of ionizing radiation. The paper will highlight the contribution this technology is expected to make with regard to the prevention of foodborne diseases and food losses. (author). 6 refs, 7 graphs.

In a short historical overview, the development from laboratory use of X-ray machines to large scale industrial irradiation facilities is given. A comparison between machine sources and isotope sources is made and advantages and disadvantages of each are discussed. Technical considerations in irradiator designs like penetration depth, dose uniformity ratio, dose distribution, product dimensions, process parameters, etc. and the limits in optimalization of process conditions are presented. The economics of scale play an important role in radiation processing. The high initial investment and the skilled staff required to operate an irradiation facility can only be economically justified by the irradiation of large

volumes. The dependence on (seasonal) availability of food products and the still limited application of the food irradiation processes are discussed. A typical multi-purpose irradiator, the pallet irradiator, will be presented and major aspects of operation are considered. Principles of Good Manufacturing Practices and Good Irradiation Practice and its practical implications for food irradiation are discussed. The influence of population growth, industrialization, social and cultural developments on the actual and future application of the food irradiation process will be discussed and an attempt will be made to identify important trends. (author). 6 refs.

27556 (IAEA-TECDOC–696, pp. 41-51) **Development of food trade in the Asia and Pacific region and prospects for commercial application of food irradiation.** Olsen, B. (International Trade Centre UNCTAD/GATT, Geneva (Switzerland)). World Health Organization, Manila (Philippines). Regional Office for the Western Pacific; Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Mar 1993. The paper will briefly analyse the Asia and Pacific Region's position in international food trade, giving details of the Region's exports of food products to the world and the internal trade in food products of the region. The paper will identify export products which can be seen as the most likely candidates for food irradiation. Furthermore, tariff and non-tariff barriers effecting a decision on the use of food irradiation for export products will be discussed. In major import markets, consumer group resistance continues to negatively effect the attitude and acceptance of the trade to deal in irradiated food products. Could the development of national and regional trade in selected irradiated food products represent a basis for a gradual, universal development of trade in these products? Dosimetry is fundamental to any irradiation processing operation. When food is processed, accurate dosimetry is required to ensure that the facility is operating as designed in terms of personnel exposure; and to validate the dose absorbed by the food, and hence to show that the process has met regulatory requirements and will produce the technical changes requested. Satisfactory dosimetry requires access to a reference dosimeter, usually held by a national regulatory agency; correct choice of a routine dosimeter; location and evaluation of the maximum and minimum dose points; and calculation of the overall average dose. Regulations may stipulate a maximum absorbed dose or maximum average absorbed dose as a safety limit for food irradiation and for some foods a minimum safety limit may also be imposed. 4 figs, 2 tabs.

Like all other food, irradiated foods must be packaged in an appropriate manner. Any general provision in the food law and regulations requiring the use of appropriate packaging and packaging materials are applicable to irradiated foods. In addition, all countries that have introduced regulations on food irradiation require that irradiated foods should be labelled to indicate that irradiation has been used in their processing.

Agricultural exports are important sources of foreign exchange for many developing countries in Asia and the Pacific. These horticultural commodities from countries endemic with quarantine pests, especially fruit fly of the Tephritidae family, have to be treated to satisfy strict regulations on plant protection and quarantine in major importing countries. The prohibition of ethylene dibromide (EDB) as a food fumigant by the US Environmental Protection Agency in 1984 followed by Japan's Ministry of Agriculture, Forestry and Fisheries in 1987, have jeopardized trade in fresh fruits and vegetables originating from tropical and sub-tropical countries. Alternative treatments to satisfy quarantine regulations have been used with limited degree of success. Irradiation by gamma rays has been demonstrated as a viable alternative. The USDA Animal Plant Health Inspection Service (APHIS) accepted irradiation as a quarantine treatment against various species of fruit fly infesting Hawaiian papaya in early 1989. The North American Plant Protection Organization also accepted irradiation as a quarantine treatment of fresh fruits and vegetables in late 1989. A review will be made on the status of research and development on irradiation as a quarantine treatment especially as viable method to overcome trade barriers on tropical fruits. Research carried out under the sponsorship of FAO and IAEA in the past five years demonstrated that a minimum radiation dose of 150 Gy is effective to disinfest fruits and vegetables against all species of fruit fly tested without affecting the quality of host commodities. A minimum dose of 300 Gy is effective against mango seed weevil, mites and other insects which are subject to quarantine restrictions in certain importing countries. An international protocol to demonstrate the efficacy of irradiation as a quarantine treatment on a practical scale will be described. 10 refs, 4 tabs.

Many countries in the Asian region have performed active research to develop irradiation technology to the present status, and some countries have already processed certain food items and ingredients for commercial use. Other countries are in the process of formulating regulations governing trade in irradiated foods. The

task of the Asian Regional Co-operative Project on Food Irradiation is the transfer of technology by developing suitable infrastructure, liaising with food industries in the region, harmonizing regulations and removing disparities for a co-ordinated effort to popularize the technology. 1 tab.

The People's Republic of China views irradiation technology as an important means of food processing and preservation which is worthy of further development. It is expected that ongoing research and education programmes will ensure that consumers come to accept this technology as they have other food preservation procedures. It is the responsibility of the government to develop food irradiation by paying attention to and promoting cooperation between research, government, industry and consumers.

As national and international trade in food increases, and as markets become more knowledgeable and demanding, all food preservation techniques must be applied in a consistent, uniform manner using recognized systems of control. Such systems are particularly relevant to irradiation since inspection of the final product cannot reveal previous handling or the treatment applied. Several UN agencies provide governments with food control assistance. FAO has a major programme to provide assistance and training on food laws and regulations, on food laboratories and inspection systems, on monitoring of contaminants, and on the formulation of national strategies for the control of food quality. Other agencies have specialized programmes relating to their primary interest. For example, the WHO focuses on food safety, both chemical and microbiological. It also promotes processes, such as irradiation which can make a contribution to primary health care. The IAEA has training and support programmes for the appropriate use of nuclear techniques in food and agriculture. Together, the three agencies support the work of the International Consultative Groups on Food Irradiation (ICGFI) which provides codes of Good Irradiation Practice, guidelines, training courses and inventories of use to regulators and industry. The key areas for control in food irradiation facilities are the design, construction and operation of the facility; personnel training; raw materials; product processing, including packaging materials; record maintenance; and the environmental impact of the overall operation. Source: OSTI; NTIS (US Sales Only); INIS.

Food irradiation can offer its full potential benefit only if irradiation facilities and processes are subject to strict control measures. The training of personnel involved in the process and inspection or control of the process and facilities must form an integral part of all food irradiation control procedures. Thus, training courses for irradiator operators, plant managers and supervisors that address proper processing with emphasis on good manufacturing practices (GMPs), dosimetry, record keeping and lot identification should be organized. For food control officials, training in the appropriate inspection procedures required for food irradiation facilities and processes is essential. Last but not least, voluntary compliance is deemed as an ideal but conceivable strategy to sustain and acceptable degree of quality assurance and facilitate effective control and hence should be promoted. (author). 13 refs.

27567 (IAEA-TECDOC–696, pp. 131-138) **Status of regulatory control of food irradiation in Asia and the Pacific identification of gaps and discussion of need for harmonization.** Pothisiri, P. Among the countries in the Asia and Pacific Region, the status of regulatory control of food irradiation varies from country to country. Such controls range from being non-existent to the application of the recommended Codex Standard on Irradiated Foods and related code of practice. The details of regulatory control in each of the countries of the region that have established regulations are discussed and gaps in these controls have been identified. Regulatory control on food irradiation is indispensable for a country in order to safeguard consumers as well as to facilitate trade. Without regulatory control systems, countries may not be in a position to accommodate irradiated foods in their market. Inappropriate regulatory requirements or inefficient enforcement may, in fact, act as an obstacle to development in the food irradiation industry and international trade in irradiated foods. Hence, harmonization of regulatory control systems should further enhance the development and acceptance of the food irradiation process and trade. Strategies for harmonization could be carried out in two steps: First, the countries must try to develop national policy and directives for food irradiation control as part of their universal food control laws/regulations and strictly adhere to the principles and approaches of good irradiation practice. Secondly, effective enforcement of regulatory control which is consistent with international standards must be developed. (author). 9 refs, 5 tabs.

Considerable guidance is available to managers of an irradiator plant on ways and means to produce safe, wholesome, quality irradiated foods. The foundation for good manufacturing practices (GMPs), which apply to all food processes, is the Codex General Principles of Food Hygiene. These principles provide good common sense procedures in the handling of food for human consumption in order to ensure safe, wholesome quality products. The GMPs cover the growing, harvesting, preparation, processing, packaging, storage, transport, distribution and sale of food. They provide good check lists for safety and quality. More detailed guidelines specifically aimed at food irradiation are found in the Codex Code of Practice for the Operation of Irradiation Facilities and in the Codes of Good Irradiation Practice (GIPs) developed by the International Consultative Group on Food Irradiation. GIPs are available for eight commodity groups. They provide guidance on pre-irradiation handling (including microbiological guidelines), packaging, pre-irradiation storage and transport, irradiation facilities and absorbed doses, post-irradiation storage and handling, final product specifications, labelling, re-irradiation and the quality of irradiated products. In order to apply GIPs effectively, it recommended that the Hazard Analysis Critical Control Point concept (HACCP) be implemented. The HACCP concept emphasizes prevention of, rather than detection of defects. The HACCP concept has been adopted by the Codex Alimentarius Commission and is being applied to Codex Codes of Practice. (author). 7 refs.

27569 (IAEA-TECDOC–696, pp. 155-160) **A harmonized approach to regulating food irradiation based on groups of foods.** Bradford, R. Source: OSTI; NTIS (US Sales Only); INIS.

Current national approvals to irradiate food are usually specific to a particular food item; even where a whole class of food (e.g. spices) is referred to in approval documentation, clearance is often limited to a specified list of items within that class. Issue of clearances in this way can lead to undue expenditure of effort on the part of industry and regulatory authorities in submitting and approving repetitive applications to irradiated food items which may be almost identical to others cleared previously. International trade in irradiated foods may be impeded if the specific food items approved in potential exporting and importing countries do not coincide, despite being closely related. It is, therefore, proposed that governments should, wherever possible, adopt a policy of issuing clearances for the irradiation of foodstuffs on a class by class basis, rather than on the basis of individual food items. Justifications for such regulatory actions in terms of economics, facilitating trade and harmonization of regulations will be provided. (author). 1 tab.

Source: OSTI; NTIS (US Sales Only); INIS.

Alongside traditional methods of processing and preserving food, the technology of food irradiation is gaining more and more attention around the world. According to the recent information published by FAO and WHO, 37 countries have cleared irradiated foods and/or irradiated food ingredients for human consumption and international trade in irradiated foods seems to be gaining momentum as food irradiation receives more attention from food industries, particularly in Asia and the Pacific. In a number of countries in Asia and the Pacific, however, the irradiation process and irradiated foods is still not receiving full government acceptance with some governments establishing a moratorium on the process, some are formulating their position and some have not yet considered the suitability of irradiation technology. The main obstacles appear to be associated with consumer uncertainty, The non-existence of/or inadequate regulatory control system, techno-economical bottlenecks and socio-political complications. Each of these major obstacles are addressed in this paper, together with a suggested way forward. The two key issues are the need to address concerns and correct myths about food irradiation through a comprehensive campaign which includes an extensive education programme for the general public in order to promote consumer acceptance and the need for governments to ensure that adequate regulatory measures on food irradiation control are enacted and effectively enforced. This publication contains the results presented by the participants of the Co-ordinated Research Programme (CRP) on improving the diagnosis and control of trypanosomiasis and other vector-borne diseases of African livestock using immunoassay methods. The CRP lasted from 1987 until 1992. The individual contributions have been indexed separately. Refs, figs and tabs.

27574 (IAEA-TECDOC–707, pp. 27-35) **Diagnostic methods in trypanosomiasis of livestock.** Luckins, A.G. (Centre for Tropical Veterinary Medicine, Midlothian (United Kingdom)). Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the diagnosis and control of trypanosomiasis and other vector-borne diseases of African livestock using immunoassay methods: Results of an FAO/IAEA/DGIS co-ordinated research programme.* [174p.] Order Number DE93630772. Source: OSTI; NTIS (US Sales Only); INIS.

In domesticated livestock infected with pathogenic trypanosomes the clinical signs of disease are not pathognomonic and parasitological methods of diagnosis fail to detect all infected animals, especially those with chronic disease. Consequently, there has been a great deal of interest in immunological approaches to diagnosis, especially in the past few years since the development of monoclonal antibodies has led to considerable improvement in serological techniques. Trypanosomes elicit strong humoral immune responses and antibodies can be detected readily in infected animals. Although many different serological tests have been used for diagnosis of trypanosomiasis, currently most attention is directed towards primary binding assays, particularly enzyme linked immunosorbent assays (ELISA). Although these assays show a high level of diagnostic sensitivity, the persistence of antibodies for several months in the serum of recovered animals precludes identification of those with active infections. Modifications of the ELISA to detect circulating trypanosomal antigen in infected animals by the use of species-specific monoclonal antibodies against Trypanosoma brucei/evansi, T. congolense and T. vivax will not only overcome this problem but also provide information on the infecting trypanosome species. The use of a particular diagnostic strategy, however, will depend on the epidemiological circumstances of the disease. It is likely that these requirements will differ depending on which particular trypanosome species is involved, which method of control is being employed and what measure of post control surveillance is envisaged. None of the tests presently used is 100% sensitive and so for the foreseeable future a combination of clinical, parasitological and immunological tests will continue to be needed for the diagnosis of trypanosomiasis. (author). 29 refs, 1 fig., 4 tabs.

27575 (IAEA-TECDOC–707, pp. 37-41) **Diagnostic techniques for animal trypanosomiasis: What future for serology?.** Connor, R.J. (Regional Tsetse and Trypanosomiasis Control Programme, Harare (Zimbabwe)). Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the diagnosis and control of trypanosomiasis and other vector-borne diseases of African livestock using immunoassay methods: Results of an FAO/IAEA/DGIS co-ordinated research programme.* [174p.] Order Number DE93630772. Source: OSTI; NTIS (US Sales Only); INIS.

The urgent requirement for improved food production in sub-Saharan Africa means that the diagnosis of animal trypanosomiasis must be improved at the producer level. Veterinary field staff have to be properly equipped to do their routine work which includes general diagnostic duties. No single diagnostic method is suitable in all circumstances, and so several methods may have to be used in a complementary manner. Ag-ELISAs have an obvious role in epidemiological studies, disease surveillance and research, but in the latter area they may soon be supplemented or even replaced by DNA techniques. (author). 5 refs, 2 tabs.

27576 (IAEA-TECDOC–707, pp. 43-50) **Application of the ELISA antigen-detection technique for the detection of apparent drug resistance trypanosome strains in Senegal.** Diaite, A. (Senegales Agricultural Research Inst. (ISRA), Dakar (Senegal). National Lab. for Stock-Breeding and Veterinary Research); Seye, M.; Vassiliades, G.; Mane, A.; Ndiaye, T. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the diagnosis and control of trypanosomiasis and other vector-borne diseases of African livestock using immunoassay methods: Results of an FAO/IAEA/DGIS co-ordinated research programme.* [174p.] Order Number DE93630772. Source: OSTI; NTIS (US Sales Only); INIS.

The antigen ELISA technique for the detection of trypanosomal antigens of Tryponosoma brucei, T. congolense and T. vivax in serum was used in a two part study in the South-Central region of Senegal (Sokone region), which is infested by tsetse flies. The first part of the study consisted of validating the technique at the Senegalese Institute for Agricultural Research (ISRA). The second part of the study involved use of the technique to study the incidence of trypanosomiasis in a Diakore (Zebu-N dama cross) breeding area and to detect drug resistant trypanosome strains. In the drug resistance study, preliminary investigations involved the examination of 196 samples using the ELISA and Buffy Coat Technique, while in a second investigation 883 samples were examined. The animals were treated with Berenil, then with Samorin and finally with Ethidium according to defined protocols. The results obtained indicated the existence of drug resistant strains but further investigations including subinoculation of animals and laboratory trials are needed to confirm these findings. (author). 6 refs, 9 tabs.

27577 (IAEA-TECDOC–707, pp. 51-57) **The use of an antigen-detection ELISA for the diagnosis of trypanosome infections in N'dama cattle in Gambia.** Faye, J. (International Trypanotolerant (ITC). Banjul (Gambia)). Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the diagnosis and control of trypanosomiasis and other vector-borne diseases of African livestock using immunoassay methods: Results of an FAO/IAEA/DGIS co-ordinated research programme.* [174p.] Order Number DE93630772. Source: OSTI; NTIS (US Sales Only); INIS.

An antigen-detection enzyme-linked immunosorbent assay (Ag-ELISA) for the detection of circulating trypanosomal antigens was evaluated for use in the diagnosis of trypanosomiasis in N'dama cattle in Gambia. Initial evaluation was carried out in cattle kept in areas of low or high tsetse challenge. Overall, approximately 12% of samples were parasite, but 67% showed presence of circulating antigens. The overall apparent sensitivity of the Ag-ELISA was 75%. In a separate experiment, the effects of treatment of antigenaemic N'dama cattle on weight gain and packed cell volume (PCV) was determined in animals kept under low level natural tsetse challenge. No differences were found in PCVs between drug treated and untreated animals but there was a significant weight gain in the drug treated group. Comparison of the same parameters in cattle in which parasites were detected by buffy coat technique

(BCT), cattle which were Ag-ELISA positive but BCT negative, and cattle which were Ag-ELISA negative and BCT negative revealed little differences in weight, but PCVs were significantly lower in animals with a patent parasitaemia. (author). 4 refs, 4 figs, 3 tabs.

27578 (IAEA-TECDOC–707, pp. 59-64) **The use of antigen-detection ELISA (Ag-ELISA) in diagnosing bovine trypanosomiasis and assessing the efficacy of chemotherapy in North West Ghana.** Doku, C.K. (Central Veterinary Lab., Tamale (Ghana). Tsetse Control Unit). Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the diagnosis and control of trypanosomiasis and other vector-borne diseases of African livestock using immunoassay methods: Results of an FAO/IAEA/DGIS co-ordinated research programme.* [174p.] Order Number DE93630772. Source: OSTI; NTIS (US Sales Only); INIS.

Ag-ELISA was used for the diagnosis of bovine trypanosomiasis in low and medium tsetse challenge areas of North-Western Ghana. At the Livestock Breeding Station (LBS), a low tsetse challenge area, parasites were detected by the buffy coat technique (BCT) in 12 (3.9%) of 304 animals while in the medium challenge area, Koduziegu, the prevalence rate was 6.8%. Using Ag-ELISA, the prevalence rates were 20.1% at LBS and 26.7% in Koduziegu showing that Ag-ELISA was 4-5 times more sensitive than the buffy coat technique. When the results of the two tests were combined, the prevalence rates rose to 23.4% at the LBS and 30.8% at Koduziegu indicating the complementary of the two tests. The most common trypanosome species detected in the two areas using the buffy coat technique was T. congolense (43.9%) followed by T. vivax (34.1%) and T. brucei (19.5%) with a ratio of single to mixed infections of 2:1. In contrast, by Ag-ELISA T. vivax was most often present (55.3%) followed by T. congolense (40.9%) and T. brucei (24.2%). Over 17% of the animals showed presence of mixed infections involving two or three trypanosome species. A pilot control project using chemotherapy was carried out in a trypanosomiasis endemic area. Blood was collected from 60 Zebu cattle; 24 of the animals had parasitaemia while 42 had circulating antigens. Forty four (73.3%) animals had PCV values below 30%. Four weeks after treatment with Berenil only 3 (5%) animals had parasitaemia while 33 (55%) still showed evidence of circulating antigens. The number of animals with PCV values greater than 30% also rose from 16 to 34. By the end of the study, when cattle had been treated on five occasions, 90% of the cattle had PCV values equal to or greater than 30% even though antigenaemia persisted in 23 cattle. (author). 5 refs, 4 figs, 1 tab.

27579 (IAEA-TECDOC–707, pp. 65-68) **Evaluation of monoclonal antibody-based antigen detection immunoassays for the diagnosis of trypanosoma congolense and T. vivax in Mali.** Diall, O. (Laboratorie Central Veterinaire du Mali, Bamako (Mali)); Diarra, B.; Sanogo, Y. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the diagnosis and control of trypanosomiasis and other vector-borne diseases of African livestock using immunoassay methods: Results of an FAO/IAEA/DGIS co-ordinated research programme.* [174p.] Order Number DE93630772. Source: OSTI; NTIS (US Sales Only); INIS.

A monoclonal antibody-based ELISA test for the detection of circulating antigens of T. congolense and T. vivax in infected cattle was evaluated in cattle populations in both endemic and tsetse-free areas. The sensitivity of the assay for T. vivax based on correlation of positive results with the presence of overt, patent parasitaemia was unsatisfactory but a higher, more satisfactory sensitivity was obtained with T. congolense. Analysis of sera obtained from cattle kept in areas considered free from tsetse and tick borne diseases, indicated that the assays had a high specificity with a relatively low proportion of sera showing reactions for presence of T. congolense or T. vivax antigens. (author). 8 refs, 2 tabs.

27580 (IAEA-TECDOC–707, pp. 69-77) **The validation of an Ag-ELISA for the diagnosis of trypanosomiasis in cattle in Uganda and its use in assessing the efficacy of a control programme.** Okuna, N.M. (Uganda Trypanosomiasis Research Organisation (UTRO), Tororo (Uganda)); Mayende, J.S.P.; Magona, J. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the diagnosis and control of trypanosomiasis and other vector-borne diseases of African livestock using immunoassay methods: Results of an FAO/IAEA/DGIS co-ordinated research programme.* [174p.] Order Number DE93630772. Source: OSTI; NTIS (US Sales Only); INIS.

An antigen detection ELISA (Ag-ELISA) for the diagnosis of trypanosomiasis was established in UTRO. The Ag-ELISA was used to assess the efficacy on an integrated tsetse and trypanosomiasis control programme which started in June 1991. Cattle were screened for trypanosomiasis using parasitologial tests and the Ag-ELISA. Cattle in Masafu where no control was implemented were screened for comparison with areas where control had been applied. Six months from the onset of control there was a reduction in the prevalence of trypanosomiasis throughout the control area. Six months from the onset of control there was a reduction in the prevalence of trypanosomiasis through the control area. Six months later, prevalence of trypanosomiasis had started rising throughout the control area with the exception of Buteba, where 1% Deltamethrin (Spot-on) had been applied to cattle. In Buteba the presence of trypanosomiasis was only detectable by Ag-ELISA. In Masafu where there was no control, prevalence of trypanosomiasis remained high. The Ag-ELISA consistently showed the presence of greater levels of infection than was revealed by microscopic methods and its usefulness was confirmed both as a means of monitoring the effectiveness of the control campaign and in identifying individual animals with non-patent active infections. 6 refs, 7 figs, 1 tab.

27581 (IAEA-TECDOC–707, pp. 79-86) **Antigen-detection enzyme-linked immunoassay (Ag-ELISA) as an aid to the diagnosis of animal trypanosomiasis in Tanzania.** Mbwambo, H.A. (Animal Disease Research Inst. (ADRI), Dar-es-Salaam (Tanzania)); Mpokwa, M.H. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the diagnosis and control of trypanosomiasis and other vector-borne diseases of African livestock using immunoassay methods: Results of an FAO/IAEA/DGIS co-ordinated research programme.* [174p.] Order Number DE93630772. Source: OSTI; NTIS (US Sales Only); INIS.

An antigen-detection, enzyme linked immunosorbent assay (Ag-ELISA) was introduced at ADRI, as an aid to the accurate diagnosis of animal trypanosomiasis. Forty cows were screened for trypanosomiasis by buffy coat technique (BCT) and Ag-ELISA once every three weeks for a total period of 57 weeks. The Ag-ELISA revealed the presence of trypanosomal antigens in 49.2% of the 716 samples; 27% were positive for trypanosomiasis by BCT. Trypanosomal antigens disappeared from the serum of infected animals between 16-30 days after treatment with a curative dose of the trypanocidal drug Berenil (10.0 mg/kg). It was concluded that Ag-ELISA considerably enhanced diagnostic capability and in addition enabled assessment of the efficacy of trypanocidal drug treatment. Subsequently, the Ag-ELISA technique was used to verify the effectiveness of the implementation of a tsetse and trypanosomiasis control programme in Mwangapwani, Zanzibar. Two hundred and eighty two cattle were bled and screened for trypanosomiasis. Using the microhaematocrit centrifuge technique (MHCT) trypanosomes were detected in 38 (13.5%) of the sampled animals whilst using Ag-ELISA, antigenaemia was detected in 61 (21.6%) cattle. Combined MHCT and Ag-ELISA results showed a trypanosomiasis point prevalence rate of 27.0% in cattle in the Mangapwani area. It was concluded that the Ag-ELISA used in combination with the MHCT/BCT will play an important role in tsetse and trypanosomiasis control programmes. 6 refs, 1 fig., 5 tabs.

27582 (IAEA-TECDOC–707, pp. 87-93) **Field validation and use of the antigen-ELISA to monitor the effectiveness of a tsetse and trypanosomiasis control campaign in the Gwembe valley, Zambia.** Sinyangwe, L.N. (Central Veterinary Research Inst. (CVRI), Lusaka (Zambia)); Munyama, G.M.; Sabbe, F.; Chitambo, H. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the diagnosis and control of trypanosomiasis and other vector-borne diseases of African livestock using immunoassay methods: Results of an FAO/IAEA/DGIS co-ordinated research programme.* [174p.] Order Number DE93630772. Source: OSTI; NTIS (US Sales Only); INIS.

A monoclonal antibody-based antigen-detection enzyme immunoassay (Ag-ELISA) for the diagnosis of the three major tsetse - transmitted trypanosome species which infect cattle was evaluated in areas in Zambia in which bovine trypanosomiasis is endemic. Two hundred and thirty eight (23.4%) of 1015 sera examined were positive for circulating antigens whereas only 88 (8.6%) had demonstrable parasitaemia as revealed by the buffy coat technique (BCT). With both techniques, the predominant trypanosome species detected was T. congolense. Many animals were shown by Ag-ELISA to carry mixed infections with 2 or 3 species of trypanosomes, whilst only one mixed infection was identified using the BCT. The Ag-ELISA was subsequently used to monitor the effectiveness of tsetse and trypanosomiasis control measures implemented by the Regional Tsetse and Trypanosomiasis Control Programme (RTTCP) in the Gwembe Valley, Zambia, an area declared free from tsetse flies. Five sentinel herds of 20 cattle were screened monthly for the presence of trypanosomes using the BCT and Ag-ELISA. Sampling was carried out for 12 months. No trypanosomes were detected by use of BCT, in contrast, 10% of the animals showed presence of circulating trypanosomal antigen. A number of antigenaemic animals treated with diminazene aceturate (Berenil) subsequently became negative. (author). 9 refs, 3 figs, 4 tabs.

27583 (IAEA-TECDOC–707, pp. 95-100) **Validation of the antigen ELISA in comparison with parasitological techniques for the diagnosis of bovine trypanosomiasis in Zimbabwe.** Ries, R. (Veterinary Research Lab., Harare (Zimbabwe)). Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the diagnosis and control of trypanosomiasis and other vector-borne diseases of African livestock using immunoassay methods: Results of an FAO/IAEA/DGIS co-ordinated research programme.* [174p.] Order Number DE93630772. Source: OSTI; NTIS (US Sales Only); INIS.

The antigen ELISA (Ag-ELISA) for the detection of trypanosomal infections was used to test sera from naturally infected cattle and the results were correlated with those obtained by buffy coat technique (BCT). Sera were obtained from cattle kept in a tsetse free area to determine test sensitivity and from a second tsetse free area to obtain baseline values for a group of animals which were later to be moved to an area of high tsetse challenge. The Ag-ELISA was apparently 98.4% specific. In the area of high tsetse challenge the buffy coat technique detected 75 (26.6%) infections while the antigen ELISA detected 110 (39.0%) infections. The ELISA failed to detect antigens in some parasitologically positive animals, but the two were complementary for the diagnosis of trypanosomiasis in individual animals. An unexpectedly high proportion of antigen positive animals (25.0%) was found in the second tsetse free area but these infections could be due to non cyclical transmission indicating that although tsetse eradication may remove the vector, sub-clinical trypanosomiasis may persist in the cattle population unless measures are taken to provide adequate trypanocidal drug therapy. (author). 2 refs, 6 figs, 1 tab.

27584 (IAEA-TECDOC–707, pp. 101-109) **The use of the antigen ELISA for the monitoring of trypanosomal infections in cattle in Zimbabwe.** Ries, R. (Veterinary Research Lab., Harare (Zimbabwe)); Connor, R.J. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the diagnosis and control of trypanosomiasis and other vector-borne diseases of African livestock using immunoassay methods: Results of an FAO/IAEA/DGIS co-ordinated research programme.* [174p.] Order Number DE93630772. Source: OSTI; NTIS (US Sales Only); INIS.

The antigen ELISA (Ag-ELISA) for the detection of trypanosomal was used in the diagnosis of bovine trypanosomiasis in Gokwe District, an area from which tsetse flies had been cleared recently; in Hwange Communal Land, which although free from tsetse flies for 20 years, was threatened by reinvasion; and as part of a national survey of vector-borne diseases to determine the extent and prevalence of trypanosomal infections throughout the country. In Gokwe and Hwange all the animals tested were negative for parasites by Buffy Coat Technique (BCT), while the Ag-ELISA results showed that 42.9% and 32.3% respectively of the animals were infected. In the national survey, trypanosomal antigens were detected in cattle at 46.1% of the locations from which samples were collected, most of them in tsetse free areas. These results could be due to reinvasion or persistence of tsetse flies in very small numbers, residual infections of low pathogenicity, or temporary introduction of flies by transport vehicles. (author). 4 refs, 5 figs, 2 tabs.

27585 (IAEA-TECDOC–707, pp. 111-119) **Prevalence of trypanosomiasis in pastoral camels in the Butana plains, mid-eastern Sudan.** Elamin, E.A. (Khartoum Univ., Khartoum-North (Sudan). Dept. of Parasitology); Hassan, E.M.; Elbashir, M.O.A.; Luckins, A.G. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the diagnosis and control of trypanosomiasis and other vector-borne diseases of African livestock using immunoassay methods: Results of an FAO/IAEA/DGIS co-ordinated research programme.* [174p.] Order Number DE93630772. Source: OSTI; NTIS (US Sales Only); INIS.

A total of 1758 camels were examined for the presence of trypanosomal infections using conventional parasitological diagnostic techniques and an Ag-ELISA for the detection of circulating trypanosomal antigens. The survey was conducted mostly during the dry season from July 1989 to June 1990. Experimental studies using camels and goats indicated that trypanosomal antigens were present in the serum of infected animals 2 to 4 days after infection in camels and 2 to 7 days in goats. Following treatment, antigen disappeared within 7-14 days. In pastoral camels, patent parasitaemias were detected in 106 (6%) camels, with most of the infections occurring during the latter part of the dry season. Circulating trypanosomal antigens were present in 79 of the camels with active infections, hence the sensitivity based on the presence of a patent parasitaemia was 74.5%. In the 1652 camels in which there was no evidence of patent infection, circulating trypanosomal antigen was present in 679. The overall prevalence rate in all camels sampled was 43%. Over the period September to May there was an increase in the proportion of camels with demonstrable parasitaemia but during the same period the proportion of animals with circulating trypanosomal antigen remained at approximately 35%. (author). 16 refs, 6 figs 1 tab.

27586 (IAEA-TECDOC–707, pp. 121-130) **Use of ELISA in the diagnosis of infection and evaluation of treatment with Cymelarsan in camels infected with Trypanosoma evansi in Kenya.** Olaho-Mukani, W. (Kenya Trypanosomiasis Research Inst. (KETRI), Kikuyu (Kenya)); Omuse, J.K.; Nyang'ao, J.M.N.; Mutugi, M.W.; Ngaira, J.M.; Luckins, A.G.; Jeffires, P. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the diagnosis and control of trypanosomiasis and other vector-borne diseases of African livestock using immunoassay methods: Results of an FAO/IAEA/DGIS co-ordinated research programme.* [174p.] Order Number DE93630772. Source: OSTI; NTIS (US Sales Only); INIS.

A polyclonal based antigen detection enzyme immunoassay (Ag-ELISA) was validated and used for the diagnosis of camel trypanosomiasis in five localities in Kenya. The Ag-ELISA results were correlated with those of parasitological tests, namely, Buffy Coat Technique (BCT) and rodent subinoculation (RI). More animals showed evidence of infection using Ag-ELISA than when using BCT and RI, and showed infection rates ranging from 45.3% to 86.2% in sampled herds, compared with 0.8% to 18% using parasitologial tests. An overall apparent sensitivity of 74% by Ag-ELISA was obtained after screening sera from three camel herds. Higher ELISA values were observed in those herds with the highest rate of patent infection or where drug intervention was not being practised. However, the study revealed that trypanosomiasis was endemic in all the sampled herds and although treatment with quinapyramine sulphate suppressed parasitaemia, the presence of circulating trypanosomal antigens indicated the probable persistence of infection due to resistance to this drug. In experimental camels, the use of Ag-ELISA in evaluating the efficacy of Cymelarsan revealed that in more than 80% of the treated camels there appeared to be cure, characterized by the absence of both parasitaemia and circulating trypanosomal antigens. However, in a few animals relapse in parasitaemia occurred, and in a number of camels, antigenaemia persisted throughout the study period. Treatment on the basis of a positive Ag-ELISA reduced the proportion of

Ag-positive animals from 75% to 26% and parasite positive animals were no longer present at the end of the experiment. (author). 13 refs, 4 figs, 3 tabs.

27587 (IAEA-TECDOC–707, pp. 133-141) **Use of the ELISA in studies on tropical theileriosis in Morocco.** Kachani, M. (Institut Agronomique et Veterinaire Hassan II, Rabat (Morocco). Dept. de Parasitologie); Williamson, S.; Ouhelli, H. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1993. In *Improving the diagnosis and control of trypanosomiasis and other vector-borne diseases of African livestock using immunoassay methods: Results of an FAO/IAEA/DGIS co-ordinated research programme.* [174p.] Order Number DE93630772. Source: OSTI; NTIS (US Sales Only); INIS.

An enzyme-linked immunosorbent assay (ELISA) was developed for use in sero-epidemiological studies of theileriosis caused by Theileria annulata in Morocco. The antigen used was prepared from sonicated whole purified piroplasmas. The ELISA was used to study the serological responses in calves which where experimentally immunized with a schizont-infected attenuated cell line and challenged a month later with a lethal dose of sporozoites. The test was also used to study post vaccinal antibodies in pregnant cows and in animals immunized with different doses of the attenuated cell lines at different levels of passage. Finally, the test was used to screen sear collected from cattle in an area where infection with T. annulata was endemic before and after the theileriosis season. Sera from animals in the above studies were also analyzed using an indirect fluorescent antibody test (IFAT) with T. annulata piroplasmas in order to compare the relative sensitivities of the two tests. It was found that the piroplasma stage of T. annulata was a more appropriate stage from which to prepare antigen for use in ELISA then the sporozoite or schizont stages. A marked heterogeneity in antibody response was observed in animals vaccinated using an attenuated cell line vaccine, however, little difference in this response was seen between exotic and local animals which had not been previously exposed to infection with T. annulata. A concordance level of 91.5% was found between diagnosis by blood smears and ELISA. (author). 9 refs, 4 figs, 2 tabs.

27588 (IAEA/UNDP–INS/88/013-25) **Agricultural production - Phase 2. Indonesia. Sources and sinks of nitrogen-E phosphorus-based nutrients in cropping systems: Technical report. Report prepared for the Government of the Republic of Indonesia.** Wetselaar, R.I. United Nations Development Programme; International Atomic Energy Agency, Vienna (Austria). 1992. [23p.] Project INS/88/013;INS/5/021. Order Number DE93629392. Source: OSTI; NTIS (US Sales Only); INIS.

This document is the report of an expert mission to assist in the initiation of research on sustainable agriculture in rice-based cropping systems as related to the flow of plant nutrients, and on the use of legumes in upland cropping systems. Experimental suggestions include an investigation of the acid tolerance of different soybean strains under upland conditions, an analysis of ways to replace fertilizer nitrogen for rice crops by a green manure such as azolla, and a study of the increase in nutrient availability due to th presence of fish in a paddy field.

27589 (IAEA/UNDP–INS/88/013-TR) **Application of isotopes and radiation to increasing agricultural production - Phase 2. Indonesia. Project findings and recommendations: Terminal report. Report prepared for the Government of the Republic of Indonesia.** United Nations Development Programme; International Atomic Energy Agency, Vienna (Austria). 1992. [10p.] Project INS/88/013;INS/5/021. Order Number DE93629391. Source: OSTI; NTIS (US Sales Only); INIS.

This Phase 2 Project was primarily aimed at consolidating the advances made during the previous phase, formulating practical agricultural technologies which can be adopted by farmers, disseminating and applying these technologies, and enhancing the capability of the Centre for Application of Isotopes and Radiation (CAIR) to conduct agricultural research using nuclear and related techniques. Outputs generated by this project were generally in accordance with those anticipated in the Project Document. Some outputs have been transferred to the target beneficiaries (farmers) through existing systems of extension, in co-operation with the main implementing agency (BATAN). Other outputs have potential for further assessment, and may lead to practical applications in future. The rest remain as important contributions to scientific knowledge. The project has been managed to assure sustainability after project termination. A strong indication of such sustainability is evident in the on-going research and development work at CAIR and the adoption of transferred technologies by the end-users. To keep up with rapid global advancements in bio-science and technology, a new project on application of nuclear and related techniques in agricultural bio-science and technology would be needed in relation to the second long-term phase of the national development programmes. (author).

27590 (IAEA/UNDP–KEN/90/023-TR) **Fate of trypanocidal drugs in cattle (chemotherapy of trypanosomiasis). Kenya: Terminal report. Report prepared for the Government of Kenya.** International Atomic Energy Agency, Vienna (Austria); United Nations Development Programme. 1992. [69p.] Project KEN/90/023;KEN/5/012. Order Number DE93630773. Source: OSTI; NTIS (US Sales Only); INIS.

This document is the final report of a project to determine the fate of tryponocidal drugs in cattle. Drugs are still the primary agent in the struggle against trypanosomiasis although there is little data on their pharmacokinetics, residue levels, bioavailability rates, etc. This project aimed to provide such information for the three drugs Diminazene aceturate (Berenil), Isometamidium chloride (Samorin) and Homidium bromide (Ethidium). Figs and tabs.

27591 (INIS-mf–13539) **Decontamination of black pepper and red pepper by gamma radiation.** Oularbi, S. (Centre de Developpement des Techniques Nucleaires, Algiers (Algeria)); Mansouri, B. Secretariat d'Etat a la Recherche, Algiers (Algeria). Apr 1993. [17p.] (In French). Order Number DE93629397. Source: OSTI; NTIS (US Sales Only); INIS.

In the present work, it has been studied the decontamination of two types of spices (black pepper and red pepper) by gamma radiation. The initial microbial population of spices not treated is about 10 (7) to 10 (8) per gram. The population decrease exponentially with irradiation dose. By this, it has been established that a dose of 6 kGy reduces the microbial flora low than 10 (3) per gram. A total elimination of moulds is obtained at dose of 8 kGy.

27592 (INIS-mf–13552) **Economic and agricultural impact of mutation breeding in fruit trees.** Mutation breeding review. Spiegel Roy, P. (Volcani Center, Bet Dagan (Israel). Dept. of Fruit Breeding and Genetics). Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). May 1990. [25p.] Order Number DE93630766. Source: OSTI; NTIS (US Sales Only); INIS.

Constraints of conventional cross breeding in fruit trees, wide market acceptance of definite cultivars, especially in apple, pear, citrus and wine grape, and the increased impact of natural mutants provide incentives for mutation breeding. Only few induced mutants in fruit trees have been commercialized and are being planted on a large scale. The main method followed in mutation breeding of tree fruit has been acute irradiation of meristematic multicellular buds but, Chimera formation and reversion present a serious problem. 87 refs, 4 tabs.

Plant Breeding Section); Donini, B.; Maluszynski, M. Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jun 1990. [86p.] (In English, French). Order Number DE93630768. Source: OSTI; NTIS (US Sales Only); INIS.

Also included in French translation by R. Marie published as Mutation Breeding Review, no. 9.

Mutation induction has become an established tool in plant breeding to supplement existing germ plasma and to improve cultivars in certain specific traits. Hundreds of improved varieties have been released to farmers for many different crop species, demonstrating the economic value of the technology. Limitations arise mainly from the large mutagenized populations to be screened and from the unsatisfactory selection methods. Both limitations may be eased to some extent by advances in techniques of plant in-vitro culture. (author). Refs, 1 fig., 7 tabs.

27594 (INIS-mf–13555) **Impact of mutation breeding in rice: A review.** Mutation breeding review. Rutger, J.N. (Department of Agriculture, Stoneville, MS (United States). Agricultural Research Service). Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Jul 1992. [24p.] Order Number DE93630769. Source: OSTI; NTIS (US Sales Only); INIS.

More cultivars have been developed in rice through the use of mutation breeding than in any other crop. Direct releases of mutants as cultivars began some 30 years ago, and now total 198 cultivars. During the last 20 years, increasing use has been made of induced mutants in cross-breeding programs, leading to 80 additional cultivars. Principal improvements through mutation breeding have been earlier maturity, short stature, and grain character modifications. Rice has been a popular subject of mutagenesis because it is the world's leading food crop, has diploid inheritance, and is highly self-pollinated. In recent years induced mutation has been exploited to develop breeding tool mutants, which are defined as mutants that in themselves may not have direct agronomic application but may be useful genetic tools for crop improvement. Examples include the eui gene, hull colour mutants, normal genetic male steriles, and environmentally sensitive genetic male steriles. The environmentally sensitive genetic male steriles, especially those in which male sterility can be turned on or off by different photoperiod lengths, show promise for simplifying hybrid rice seed production both in China and the USA. Future applications of mutation in rice include induction of unusual endosperm starch types, plant types with fewer but more productive tillers, dominant dwarfs, dominant genetic male steriles, extremely early maturing mutants, nutritional mutants, and in vitro-derived mutants for tolerance to herbicides or other growth stresses. Refs, 4 figs, 2 tabs.

27595 (KAERC–802/89) **Effects of the radiation exposure on the growing of the crops (1): Effects of the radiation exposure on rice seeds and young rice-plants.** Kim Hon; Sin Chun Ho. Ministry of Atomic Energy, Pyongyang (Korea, Democratic People's Republic of). Research Center for Atomic Energy. Feb 1989. [11p.] (In Korean). Order Number DE93627985. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper have been considered the effects of the radiation exposure on seeds of the rice sorts of P-15, OCh-6 and PB-3 and young rice plants grown for 50 days. When rice seeds are exposed in the intensity of 0.05Gy/s of 8-20Gy dose, the growth force of the plants can be raised to 113-150%. The growth force of young rice-plants can be raised to 112-118% when they are exposed in the intensity of 0.01Gy/s of 5-8Gy dose. (Author).

27596 (KAERC–803/89) **Effects of the radiation exposure on the growing of the crops (2): Influence of the radiation intensity on the exposure effects of the soybean seeds.** Cho Sang Gyu, A.D.; Kim Hon; Sin Chun Ho. Ministry of Atomic Energy, Pyongyang (Korea, Democratic People's Republic of). Research Center for Atomic Energy. Feb 1989. [8p.] (In Korean). Order Number DE93627986. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper have been considered the influence of the dose intensity in the radiation exposure on the seeds of the soybean sorts of PL-O and K-8. The growth force of the plants increases from 103% to 114% when dose intensity is changed from 0.01Gy/s to 0.10Gy/s in the irradiation dose, whereas it lowers from 97% to 60% in the repression dose. At the critical dose the growth force of the plants according to the dose intensity rapidly lowers and most plants die within 15 days after sowing in the dose intensity of 0.10Gy/s. (Author).

27597 (KAERC–804/89) **Effects of the radiation exposure on the growing of the crops (3): Effects of the radiation exposure on maize seeds and young plants with humus pot.** Cho Sang Gyu, A.D.; Kim Hon; Sin Chun Ho. Ministry of Atomic Energy, Pyongyang (Korea, Democratic People's Republic of). Research Center for Atomic Energy. Feb 1989. [6p.] (In Korean). Order Number DE93627987. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper have been considered the effects of the radiation exposure on seeds and young plants with humus pot of the maize sorts of PL-6 and O-5. The initial growing of the plants can be raised to 108-117% when maize seeds are exposed in the intensity of 0.05 Gy/s of 8-12 Gy dose. When young maize plants with humus pot are exposed in the intensity of 0.03 Gy/s of 3-8 Gy dose, the growth force of the plants can be raised to 108-116%. (Author).

27598 (SSI–92-20) **Cesium and strontium in dairy milk 1955-1990 in Sweden.** Suomela, J.; Melin, J. Swedish Radiation Protection Inst., Stockholm (Sweden). Nov 1992. [18p.] (In Swedish). Order Number DE93630776. Source: OSTI; NTIS; INIS.

The report presents the measurement results. Higher levels were recorded after the bomb tests and the Chernobyl accidents. The accumulated radiation dose from dairy milk consumed during the period 1955-1990 is estimated to 0.3 mSv.

27599 (TVA/NFERC–92/5) **Fertilizer trends.** Donaldson, R. National Fertilizer and Environmental Research Center, Muscle Shoals, AL (United States). 1992. 56p. Sponsored by Tennessee Valley Authority, Knoxville, TN (United States). (TVA-Circ.–Y-227). Order Number DE93014385. Source: OSTI; NTIS.

This fourteenth edition of Fertilizer Trends presents historical fertilizer market data to aid industry, government, and financial market analysis and planners in their study of fertilizer and agricultural market cycles, market planning, and investment decisions. A 27-year summary of the US fertilizer market is presented in graphic and tabular form. Production, use, and trade data are included for each plant nutrient and sulfur. Canadian statistics have been included because of the important role of the Canadian fertilizer industry in the US fertilizer market. World production and consumption of nitrogen, phosphate, and potash are included because of the strong influence of world markets on the domestic market. Planted acreage and plant nutrient application rates for the major crops have been included to illustrate their effect on fertilizer use. Retail prices of the leading US fertilizer materials also are given.

27600 (TVA/NFERC–92/8) **Commercial fertilizers 1992.** Berry, J.T.; Montgomery, M.H. National Fertilizer and Environmental Research Center, Muscle Shoals, AL (United States). Dec 1992. 40p. Sponsored by Tennessee Valley Authority, Knoxville, TN (United States). (TVA-Bull–Y-230). Order Number DE93014384. Source: OSTI; NTIS.

Fertilizer consumption information in the USA for 1992 submitted by state regulatory officials is presented. This includes total sales or shipments for farm and non-farm use. Liming materials were excluded. Materials used for manufacture or blending of reported fertilizers or for use in other fertilizers are excluded to avoid double-counting. The consumption of multiple-nutrient and single-nutrient fertilizers is listed. Dry bulk, fluid, and bagged classes are given. Typical fertilizers include: anhydrous ammonia, aqua ammonia, nitrogen solutions, urea, ammonium nitrates, ammonium sulfates, phosphoric acid, superphosphates, potassium chlorides, and potassium sulfates.

27601 (TVA/NFERC–93/2) **North American fertilizer capacity data.** National Fertilizer and Environmental Research Center, Muscle Shoals, AL (United States). Feb 1993. 32p. Sponsored by Tennessee Valley Authority, Knoxville, TN (United States). (TVA-Circ.–Z-329). Order Number DE93014386. Source: OSTI; NTIS.

This listing of fertilizer producers and their production capacities was compiled in February 1993 with the cooperation of the US and Canadian fertilizer industry. TVA does not guarantee the completeness or accuracy of the information. Capacity is only an indicator of supply. Nameplate capacity differs from planned production levels or actual production because plants often operate above or below design capacity. Unless reported otherwise, plant capacities are based on 340 days per year of operation. No adjustment is made for partial year operation. Information is given on the following types of fertilizers: ammonia, ammonium nitrate, nitrogen solutions, urea, ammonium sulfate, phosphate rock, wet-process phosphoric acid, ammonium phosphates, concentrated superphosphates, potash, nitric acid, superphosphoric acid, upgraded phosphoric acids, normal superphosphate, elemental phosphorus, potassium sulfate, and sulfate of potash/magnesia.

27602 (ANL/BIM/CP–78742) **Chemoprevention by WR-2721.** Grdina, D.J. (Argonne National Lab., IL (United States)); Carnes, B.A. Argonne National Lab., IL (United States). [1993]. 15p. Sponsored by USDOE, Washington, DC (United States); Department of Health and Human Services, Washington, DC (United States). DOE Contract W-31109-ENG-38. Grant CA-37435. (CONF-9304141–1: 2. international cancer chemo prevention conference, Berlin (Germany), 28-30 Apr 1993). Order Number DE93012907. Source: OSTI; NTIS; INIS; GPO Dep.

WR-2721 [S-2-(3-aminopropylamino)ethylphosphorothioic acid] is an effective chemopreventive agent. C57BL x BALB/c F_1 female mice, were exposed to a single whole-body dose of 206 cGy from a ^{60}Co photon source. Those groups treated with VATR-2721 (400 mg/kg) were administered the agent i.p. 30 min prior to irradiation. Over 90% of deaths were determined to be due to tumor involvement. WR-2721 afforded significant protection against life shortening due to radiation-induced tumors of connective tissue and epithelial tissue origins. Subsequent survival time in WR-2721-treated and irradiated animals as compared to matched irradiated-only controls was extended up to 59 days. A single exposure of animals to VVR-2721 did not affect the cumulative survival curves for unirradiated mice. WR-2721 possesses chemopreventive properties which can be clinically exploited to reduce the risk to therapy-induced secondary cancers in patients who otherwise would have an excellent prognosis for cure and long-term survival.

27603 (BN-SA–3768-HEDR) **Determination of key radionuclides and parameters related to dose from the Columbia River pathway: Hanford Environmental Dose Reconstruction Project.** Napier, B.A. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 125p. Sponsored by Department of Health and Human Services, Washington, DC (United States). Order Number DE93012871. Source: OSTI; NTIS; INIS.

A series of scoping calculations has been undertaken to evaluate the absolute and relative contributions of different radionuclides and exposure pathways to doses that may have been received by individuals living in the vicinity of the Hanford Site. These scoping calculations may include some radionuclides and pathways that were included in the Phase 1 Columbia River pathway dose evaluations, as well as other potential exposure pathways being evaluated for possible inclusion in future Hanford Environmental Dose Reconstruction Project (HEDR) modeling efforts. This scoping calculation (Calculation 009) examines the contributions of numerous radionuclides to dose via environmental exposures and accumulation in water, fish, and other aquatic biota. Addressed in these calculations are the contributions to effective dose from (1) external exposure to contaminated river water, (2) ingestion of contaminated drinking water, and (3) ingestion of contaminated resident Columbia River fish. Additional information on contamination of anadromous fish and waterfowl is provided.

27604 (CEA-CONF–11308) **Ice beads and decontamination.** Manificat, A. (CEA Centre d'Etudes de Grenoble, 38 (France). Dept. de Thermohydraulique et de Physique); Gauchon, J.P. CEA Centre d'Etudes de Grenoble, 38 (France). Dept. de Thermohydraulique et de Physique. 1993. [5p.] (In French). (CONF-9303194–: Meeting on Protection, Handling, Detection and Safety, Strasbourg (France), 30 Mar - 1 apr 1993). Order Number DE93630798. Source: OSTI; NTIS (US Sales Only); INIS.

Surface treatment by abrasive blasting with ice pellets was developed by the CEA to decrease the volume of effluents in maintenance and dismantling of nuclear plants. The paper describes briefly the ice generator, with a production capacity of 200 kg per hour, the means of propulsion and use of the process for various industrial operations.

27605 (CONF-910905–5) **^{222}Rn dosimetry in the dog lung.** Harley, N.H.; Meyers, O.A.; Robbins, E.S. New York Univ., NY (United States). School of Medicine. [1991]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER60547. From 5. international symposium on the natural radiation environment; Salzburg (Austria); 22-28 Sep 1991. Order Number DE93014035. Source: OSTI; NTIS; GPO Dep.

The alpha dose to cells in bronchial airways in the beagle dog during historical exposures to ^{222}Rn decay products is calculated using updated information on airway morphometry, call nucleus depth, mucus thickness, physical dosimetry and atmospheric characteristics. The alpha dose per unit exposure to basal call nuclei in the upper airways ranges from 2 to 7 mGy WLM^{-1} (excluding the trachea) depending upon the exposure protocol used. The dose to alveolar tissue is 3 mGy WLM^{-1}. In the human lung, the dose factor for the bronchial airways is 9 mGy WLM_{-1} and for the pulmonary parenchyma 0.5 mGy WLM^{-1} The human tumors appear primarily in the first few branching airway generations while the only tumors observed in the animals were in the bronchioloalveolar region suggesting a difference in cell sensitivity to alpha radiation.

27606 (DOE/ER/60502–7) **The development of in vitro mutagenicity testing systems using T-lymphocytes: Research progress report, November 1, 1992–October 31, 1993.** Albertini, R.J. Vermont Univ., Burlington, VT (United States). May 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER60502. Order Number DE93016019. Source: OSTI; NTIS; GPO Dep.

This annual report describes progress in studies on hprt mutations induced by radon or Indium 111 along with the corresponding mutation frequency, cloning and molecular spectra in human T-lymphocytes. Parallel studies on the mutation susceptibility between individuals is being investigated by hprt mutation studies on ataxia telangiectasia and xeroderma pigmentosum.

27607 (DOE/ER/60631–11) **Radiation physics, biophysics, and radiation biology: Progress report, December 1, 1992–November 30, 1993.** Hall, E.J.; Zaider, M. Columbia Univ., New York, NY (United States). Center for Radiological Research. May 1993. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER60631. Order Number DE93014482. Source: OSTI; NTIS; INIS; GPO Dep.

Research at the Center for Radiological Research is a multidisciplenary blend of physics, chemistry and biology aimed at understanding the mechanisms involved in the health problems resulting from human exposure to ionizing radiations. The focus is increased on biochemistry and the application of the techniques of molecular biology to the problems of radiation biology. Research highlights of the program from the past year are described. A mathematical model describing the production of single-strand and double-strand breaks in DNA as a function radiation quality has been completed. For the first time Monte Carlo techniques have been used to obtain directly the spatial distribution of DNA moieties altered by radiation. This information was obtained by including the transport codes a realistic description of the electronic structure of DNA. We have investigated structure activity relationships for the potential oncogenicity of a new generation of bioreductive drugs that function as hypoxic cytotoxins. Experimental and theoretical investigation of the inverse dose rate effect, whereby medium LET radiations actually produce an c effect when the dose is protracted, is now at a point where the basic mechanisms are reasonably understood and the complex interplay between dose, dose rate and radiation quality which is necessary for the effect to be present can now be predicted at least in vitro. In terms of early radiobiological damage, a quantitative link has been established between basic energy deposition and locally multiply damaged sites, the radiochemical precursor of DNA double strand breaks; specifically, the spatial and energy deposition requirements necessary to form LMDs have been evaluated. For the first time, a mechanically understood "biological fingerprint" of high-LET radiation has been established. Specifically measurement of the ratio of inter-to intrachromosomal aberrations produces a unique signature from alpha-particles or neutrons.

27608 (DOE/ER/60631–12) **The Radiological Research Accelerator Facility: Progress report, December 1, 1992–November 30, 1993.** Hall, E.J.; Marino, S.A. Columbia Univ., New York, NY (United States). Center for Radiological Research. May 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER60631. Order Number DE93014483. Source: OSTI; NTIS; INIS; GPO Dep.

The Radiological Research Accelerator Facility (RARAF) is based on a 4-MV Van de Graaff accelerator, which is used to generate a variety of well-characterized radiation beams for research in radiobiology, radiological physics, and radiation chemistry. It is part of the Center for Radiological Research (CRR) - formerly the Radiological Research Laboratory of Columbia University, and its operation is supported as a National Facility by the US Department of Energy (DOE). As such, RARAF is available to all potential users on an equal basis and scientists outside the CRR are encouraged to submit proposals for experiments at RARAF. The operation of the Van de Graaff is supported by the DOE, but the research projects themselves must be supported separately. This report provides a listing and brief description of experiments performed at RARAF during the May 1, 1992 through April 30, 1993.

27609 (EGG-M–93073) **PC edit package for testing of annual radiation dose summary data.** Millet, W.H. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9304128–2: Department of Energy (DOE) radiation protection conference, Las Vegas, NV (United States), 13-15 Apr 1993). Order Number DE93013666. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this presentation is to introduce a software package for the testing of annual radiation dose summary data by the DOE contractor site prior to submitting the report to DOE's Radiation Records Repository. This software will identify most errors existing in the annual radiation dose summary data before the data leaves the originating site. This process will greatly reduce the reviewing and editing tasks of staff members at the repository. The SPMS Maintenance and Operations unit of EG&G Idaho, Inc. is charged with maintaining and operating a database for tracking and summing the annual radiation exposure data reported from DOE and DOE contractor facilities where monitoring of radiation exposure is required. This database, which is also referred to as the Radiation Records Repository, is used to generate comparative statistical data for trending and performance analysis on DOE's contracted facilities and its worker population.

27610 (ENEA-RT-GEN–91-02) **Medical activities and occupational safety.** Cenni, P.; Fagarazzi, G.; Farne, F.; Messora, A.; Bassi, P.; Speranza, A. ENEA, Bologna (Italy). Dec 1991. 30p. (In Italian). (RT/GEN–91-02). Order Number DE93799269. Source: OSTI; NTIS (US Sales Only); INIS.

This paper presents a synthesis of the activities developed within the ENEA (Italian Agency for Energy, New Technologies and the Environment) Occupational Medicine group working at its Bologna Nuclear Research Centre during the years 1989 and 1990. Besides carrying out the duties required by law concerning medical surveillance, these activities concern both service and research aspects in the field of human-computer interaction, environmental factors, microclimates, ergonomics and safety.

27611 (ETDE-IT–93-160) **Diet-meat and diet-milk transfer of ^{137}Cs in cattle: Values of dynamic model and values obtained in field.** Trenti, F.; Calamosca, M.; Pagano, P.; Cipone, M. Bologna Univ. (Italy); ENEA, Bologna (Italy). 1992. 6p. (CONF-9208231–1: World bujatric congress and American association of bovine practitioner, St. Paul, MN (United States), 31 Aug 1992). Order Number DE93799230. Source: OSTI; NTIS (US Sales Only); INIS.

In conditions of environmental radiocontamination, the vegetable-animal products-man food chain becomes particularly critical for the determination of population equivalent doses. Such doses may be predicted using contaminant transfer models such as NUCRAC-SAI, DOSDIM, NRPB, PATHWAY and others. These are principally founded on dynamic compartmental systems and they have in common the use of first degree kinetics, which lead to the formulation of a system of differential equations, the solution of which shows the trend of radionuclide concentration in time, in the various environmental and animal matrices. Efficacy verification of these analytical instruments is performed at its best in real situations of radioactive spill in the environment, such as the incident which occurred in Italy in 1986. In the latter occasion, a modulus was applied which belongs to a more complex model described below, and which uses the daily dietary intake of ^{137}Cs, to predict the meat and milk contamination variation in time, in the adult bovine. To verify the efficacy of this model, calculated values were compared against those measured directly by radiometry of meat and milk samples of the same bovines.

27612 (IAEA-TECDOC–698) **Generic intervention levels for protecting the public in the event of a nuclear accident or radiological emergency: Interim report for comment.** International Atomic Energy Agency, Vienna (Austria). Apr 1993. [92p.] Order Number DE93629414. Source: OSTI; NTIS (US Sales Only); INIS.

Many international organizations are in the process of developing common safety standards for protection against ionizing radiation and for the safety of radiation sources. This document is intended to provide input to the final specification of intervention levels, at which actions of various kinds to protect members oft the public after an accident are advised. It provides the radiation protection principles underlying such intervention levels and proposes numerical values for these levels based on an analysis of some of the more directly quantifiable factors involved. Factors such as social disruption, psychological factors and political considerations are discussed, but are explicitly excluded from the derivation. Refs, figs and tabs.

27613 (INIS-mf–12758, pp. 520-527) **Experimental ratio between the 'real' dose per organ and the calculated dose determined by means of the Embalse nuclear power plant's personal dosimeter.** Thomasz, E. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Seguridad Radiologica y Nuclear); Salas, C.A. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The specific purpose of the study was to determine the experimental ratio between the reading of dosimeters used by the personnel of the Embalse nuclear power plant and the 'real' dose absorbed by the worker in different organs. An anthropomorphic phantom ALDERSON internal and externally loaded with approximately 150 TLD crystals was used. This phantom was placed in five enclosures that were usually occupied by workers of the Embalse nuclear power plant. In this way, the average dose per organ and the effective equivalent dosis in each enclosure could be calculated and compared with the personal dosimeters placed over the thorax and the conversion factor rem/rem for each enclosure was determined. The average factor resulting from the five considered enclosures was 0.73 rem/rem. This means that the personal dosimeters over value the real dosis absorbed by the personnel of the Embalse nuclear power plant in approximately 37%. (Author).

27614 (INIS-mf–13543, pp. 95-109) **Effect of radon on human health.** Thomas, J. (Institut Hygieny a Epidemiologie, Prague (Czech Republic)). Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

The action of radon and its daughter products on the epithelium of lungs is outlined. Miners are most endangered by radon risk, living in homes with elevated radon levels is hazardous as well. Mentioned are various superstitious rumors concerning the effects of radon, which spread among the uninformed population. The radon risk is compared with other life risks. The data and examples are documented with tables and graphs. (M.D.). 2 tabs., 4 figs.

27615 (INIS-mf–13543, pp. 6-13) **Controlled overpressure airing as an efficient anti-radon system in existing buildings.** Moravek, P. Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

The regulatory limiting volume activity of radon in buildings is 200 Bq/m^3. A ventilation system that removes radon very efficiently from closed rooms so that its levels approach the outdoor background, has been designed and tested experimentally. The air conditioning unit has a throughput of 2x360 m^3/h with an electric power demand of 100 W. It includes a recuperation exchanger made of plastic whose efficiency is 74%, a fresh air bypass, replaceable filters, and a damper. The under-ceiling distribution system brings in fresh air whereas waste air is drawn off under the doors. The operation of the unit is controlled automatically applying a pre-set airing schedule. The results of trial operation were outstanding. (M.D.). 5 figs.

27616 (INIS-mf–13543, pp. 53-70) **Removal of radon-222 from water.** Hanslik, E. (Vyzkumny Ustav Vodohospodarsky, Prague (Czech Republic)). Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

Practical procedures for removing radon from water use the aeration principle. Theoretical formulas for radon removal and examples of existing equipment are given. Aeration in pressure systems is efficient to approximately 50% and consumes much energy. A shallow water aeration equipment, called INKA, is conventionally used. Aeration towers made of polypropylene and packed with corrugated glass-reinforced plastics sheets are also employed. Radon can also be removed by adsorption on activated carbon, which is, however, an expensive approach. Radium is removed from underground water during the conventional treatment applied to eliminate manganese and iron. Water treatment plant staff must be protected against the radon risk from aeration. (M.D.). 2 tabs., 5 figs., 12 refs.

27617 (INIS-mf–13543, pp. 128-130) **Existing experience with anti-radon provisions in the Jihlava district.** Vondrak, J. (Okresni Urad, Jihlava (Czechoslovakia)). Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

The radon contents and gamma dose rates were measured in selected houses of some towns in the Jihlava district, Czech Republic. Elevated radon levels were identified in some of the houses and remedial actions were recommended. The government can grant financial contributions for the remedial actions on request. (M.D.). 3 refs.

27618 (INIS-mf–13543, pp. 147-152) **Practical experience with the implementation of remedial actions.** Jirovec, V. (Stavebni Radonovy Servis, Hradec Kralove (Czechoslovakia)). Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

Remedial actions consist in limiting the amount of radon entering into the buildings or in securing sufficient airing. The assets and shortcomings of the various procedures are dealt with. If radon comes from the subsoil, an aired layer under the building or controlled ventilation with heat recuperation can help. Airing is the most suitable approach if radon originates from the building material. Single-family houses of the 'START' type, which have been built using panels which contain radioactive slag from power plants, pose a specific problem. The panels must be provided with shielding from the inside or replaced. (M.D.).

27619 (INIS-mf–13543, pp. 187-210) **Technologies suitable for technical provisions aimed at reducing the radiation burden of people in homes.** Breda, M. (Centrum Stavebniho Inzenyrstvi, Praha (Czechoslovakia)); Smejkal, Z. Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

Health physics authorities determine in which buildings remedial actions should be taken. Technical provisions to reduce the effective dose rate from indoor exposure include: forming an anti-radon barrier on the surface of walls (special amino amide resin- or epoxy resin-based coatings, special wallpapers), reducing the area from which radon leaks into the room (replacement of the harmful structural components), reducing the volume of contaminated air which enters the room (insulation from the subsoil, insulation of piping) and increased airing of the room. Examples of technological documentation are appended. (M.D.).

27620 (INIS-mf–13543, pp. 110-118) **Problems of 'START' type houses.** Thomas, J. (Institut Hygieny a Epidemiologie, Prague (Czech Republic)). Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

The case of the assembled single-family 'START' houses is described. The houses are made of panels which include power plant slag with a high radium content. The panels were manufactured in 1965-1983. The inhabitants are exposed to whole-body photon irradiation from the masonry and to internal irradiation from inhaled radon daughters. The slag-concrete panels have a low heat-insulating capacity, which makes the inhabitants seal the windows against heat leaks, whereupon the radon concentration in the homes additionally increases. Various feasible remedial actions are described. For instance, the inner walls can be lined with additional retention walls or aluminium foils or impermeable coatings, permanent air conditioning can be installed, the house can be thermally insulated while the sealing from windows can be removed, etc. The situation is so serious that the government of the Czech Republic decided to contribute funds for the remedial actions or to buy out the houses from the householders. (M.D.). 3 figs.

27621 (INIS-mf–13543, pp. 139-146) **Contribution of the building material to the radiation burden in buildings.** Kominek, A. (Vyzkumny Ustav Stavebnich Hmot, Brno (Czech Republic)); Broz, J. Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

A survey of building materials used in the Czech Republic and of the specific activities of ^{40}K, ^{226}Ra and ^{232}Th in these materials is presented. Czechoslovak and foreign regulatory limits for activities in building materials are given and the radiation burden of inhabitants of homes built from such materials is estimated. (M.D.). 3 tabs.

27622 (IPEN-PUB–379) **Applied in vitro radio bioassay.** Gaburo, J.C.G.; Sordi, G.M.A.A. Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil). Nov 1992. [32p.] (In Portuguese). Order Number DE93629381. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of this publication is to show the concepts and in vitro bioassay techniques as well as experimental procedures related with internal contamination evaluation. The main routes of intake, metabolic behavior, and the possible types of bioassay samples that can be collected for radionuclides analysis are described. Both biological processes and the chemical and physical behavior of the radioactive material of interest are considered and the capabilities of analytical techniques to detect and quantify the radionuclides are discussed. Next, the need of quality assurance throughout procedures are considered and finally a summary of the techniques applied to the internal routine monitoring of IPEN workers is given. (author).

27623 (JINR-E–17-92-201) **Quantum phase fluctuations in the Jaynes-cummings model: effects of cavity damping.** Ho Trung Dung; Shumovskij, A.S. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [16p.] Order Number DE93627984. Source: OSTI; NTIS (US Sales Only); INIS.

Phase properties of a coherent field interacting with a two-level atom in a cavity with very high but finite Q are studied. It is shown that due to the cavity damping the field phase is randomized more quickly than in the ideal-lossless cavity case. The Hermitian phase distribution and the phase distributions associated with the Q function and the Wigner function are compared. The similarities between them have clear interpretation in terms of the area-of-overlap in phase space. 29 refs.; 3 figs.

27624 (JINR-E–19-91-335) **Radioprotective action of glycerol and cysteamine on inactivation and mutagenesis in Salmonella tester strains after gamma and heavy ion irradiation.** Basha, S.G.; Krasavin, E.A.; Kozubek, S. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. [10p.] Order Number DE93629336. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Mutat. Res.

Inactivation and mutagenesis were studied in Salmonella tester strains after γ-irradiation and after heavy ion irradiation in the presence of glycerol and cysteamine. Bacterial cells were irradiated at Dubna, JINR. Ions from deuterons to carbon were used with residual energies 2-9 MeV/u. The protective effect of glycerol was found both for γ-radiation and for heavy ions up to 50 keV/μm for both cell inactivation and mutagenesis in Salmonella tester strains with different mutation events. Cell sensitivity slightly increased with LET before falling down. The maximum was shifted in the presence of glycerol to the left and was less pronounced. The radioprotective effect of glycerol diminished gradually with LET from 2.0 for γ-radiation to 1.1 for carbon ions. Mutagenesis increases with LET in TA100 strain; in TA98 strain no marked increase could be detected. 13 refs.; 4 figs.; 5 tabs.

27625 (LA-UR–93-1203) **Decontaminating lead bricks and shielding.** Lussiez, G.W. Los Alamos National Lab., NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930873–4: 2. international mixed waste symposium, Baltimore, MD (United States), 17-20 Aug 1993). Order Number DE93012662. Source: OSTI; NTIS; INIS; GPO Dep.

Lead used for shielding is often surface contaminated with radioisotopes and is therefore a RCRA D008 mixed waste. The technology-based standard for treatment is macroencapsulation. However, decontaminating and recycling the clean lead is a more attractive solution. Los Alamos National Laboratory decontaminates material and equipment contaminated with radioisotopes. Decontaminating lead poses special problems because of the RCRA hazard classification and the size of the inventory, now about 50 tons and likely to grow substantially because of planned decommissioning operations. This lead, in the form of bricks and other shield shapes, is surface contaminated with fission products. One of the best methods for decontaminating lead is removing the thin superficial layer of contamination with an abrasive medium trader pressure. For lead, a mixture of alumina with water and air at about 40 psig rapidly and effectively decontaminates the lead. The abrasive medium is sprayed onto the lead in a sealed-off area. The slurry of abrasive and particles of lead falls through a floor grating and is collected in a sump. A pump sends the slurry mixture back to the spray gun, creating a continuous process. The process generates small volumes of contaminated lead slurry that can be solidified and, because it passes the TCLP, is not a mixed waste. The decontaminated lead can be released for recycling.

27626 (LBL–31305) **Simplified modeling for infiltration and radon entry.** Sherman, M.H. Lawrence Berkeley Lab., CA (United States). Aug 1992. 23p. Sponsored by USDOE, Washington, DC (United States); Environmental Protection Agency, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-921203–12: Thermal performance of the exterior envelopes of buildings, Clearwater, FL (United States), 7-10 Dec 1992). Order Number DE93013902. Source: OSTI; NTIS; GPO Dep.

Air leakage in the envelopes of residential buildings is the primary mechanism for provided ventilation to those buildings. For radon the same mechanisms that drive the ventilation, drive the radon entry This paper attempts to provide a simplified physical model that can be used to understand the interactions between the building leakage distribution, the forces that drive infiltration and ventilation, and indoor radon concentrations, Combining both ventilation and entry modeling together allows an estimation of Radon concentration and exposure to be made and demonstrates how changes in the envelope or ventilation system would affect it. This paper will develop simplified modeling approaches for estimating both ventilation rate and radon entry rate based on the air tightness of the envelope and the driving forces. These approaches will use conventional leakage values (i.e. effective leakage area) to quantify the air tightness and include natural and mechanical driving forces. This paper will introduce a simplified parameter, the Radon Leakage Area, that quantifies the resistance to radon entry. To be practical for dwellings, modeling of the occupant exposures to indoor pollutants must be simple to use and not require unreasonable input data. This paper presents the derivation of the simplified physical model, and applies that model to representative situations to explore the tendencies to be expected under different circumstances.

27627 (LBL-PUB–3113) **Radiological Control Manual: Revision 0, January 1993.** Lawrence Berkeley Lab., CA (United States). Apr 1993. 201p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93013925. Source: OSTI; NTIS; INIS; GPO Dep.

This manual has been prepared by Lawrence Berkeley Laboratory to provide guidance for site-specific additions, supplements, and clarifications to the DOE Radiological Control Manual. The guidance provided in this manual is based on the requirements given in Title 10 Code of Federal Regulations Part 835, Radiation Protection for Occupational Workers, DOE Order 5480.11, Radiation Protection for Occupational Workers, and the DOE Radiological Control Manual. The topics covered are (1) excellence in radiological control, (2) radiological standards, (3) conduct of radiological work, (4) radioactive materials, (5) radiological health support operations, (6) training and qualification, and (7) radiological records.

27628 (LYCEN–9250) **Experimental dosimetry and kinetics of radioactive tracers for human applications: example of therapeutic injection of Lipiodol labelled with Iodine 131.** Ahmed Mahidi, N. (Lyon-1 Univ., 69 (France)). Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire; Lyon-1 Univ., 69 - Villeurbanne (France). Oct 1992. [175p.] (In French). Order Number DE93630806. Source: OSTI; NTIS (US Sales Only); INIS.

We have evaluated the radiation dose received by the liver and lungs for 10 patients with a hepatic carcinoma after surgical operation followed by a therapeutic dose of Lipiodol labelled with iodine 131. The cumulated activities have been obtained by using a calibrated gamma camera. Fixation and kinetics of the I^{131} Lipiodol in normal and cancers livers have been measured with the determination of the effective and biological half-lives. The calculated doses are based on the MIRD method. Results confirm that Lipiodol fixation is important in the liver at J1 (about 74% of the injected activity). Its elimination is essentially urinary, pulmonary fixation remained low, the dose received by the healthy part of liver is acceptable. These values have been compared with those obtained by another method using a thermoluminescent dosimeter (LiF) installed on the skin over the liver. Comparison between results obtained by the 2 methods shows a good correlation.

27629 (OEFZS–4628) **Sense and purpose of radiation protection training.** Malasek, A. (Hauptabteilung fuer Schulung und Ausbildung, Bereich Marketing, Forschungszentrum Seibersdorf GmbH, Seibersdorf (Austria)). Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Apr 1992. [13p.] (In German). Order Number DE93628039. Source: OSTI; NTIS (US Sales Only); INIS.

Provided with ISSN 0253-5270.

Training in radiation protection is of great significance in connection with the activities of the executive, the federal army and emergency organizations in emergency operations for the protection of the population in the case of large-scale radioactive contamination due to diverse causes. The presently valid legal situation of radiation protection training is presented in connection with the expected modification in the amendment to the SSVO. The special situation of radiation protection training for the executive, the federal army and emergency organizations is described and discussed in connection with the new aspects outlined in the draft of the new radiation protection regulation. In conclusion, problems arising in the conveyance of basic knowledge in radiation protection are illustrated by means of a concrete example. (author).

27630 (OEFZS–4670) **Lymphocytic subsets and low-dose exposure.** Tuschl, H. (Hauptabteilung Toxikologie, Bereich Lebenswissenschaften, Forschungszentrum Seibersdorf, Seibersdorf (Austria)); Kovac, R.; Eybl, E. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Mar 1993. [17p.] (In German). Order Number DE93628006. Source: OSTI; NTIS (US Sales Only); INIS.

Provided with ISSN 0253-5270.

The present investigations proved the differential radiosensitivity of lymphocytic subpopulations: From in vivo and in vitro irradiations it may be followed that the most sensitive subset are CD8 positive suppressor T cells. CD4/CD8 ratios are increased both in peripheral blood and after mitogen stimulation of lymphocytes of exposed persons. The decrease in B cells is pronounced only at higher radiation doses. Though the rate of DNA synthesis after mitogen stimulation was reduced in some exposed persons, that was no general phenomenon. Especially after tritium exposure, the observed lymphopenia correlated with an increased stimulation by PHA and an increased rate of DNA synthesis in some probands. Thus the present investigations indicate that - despite an inhibition of some immune parameters by radioexposure - the body is able to maintain its immunological homoeostasis. (authors).

27631 (PNL–8500-Pt.4) **Pacific Northwest Laboratory annual report for 1992 to the DOE Office of Energy Research: Part 4, Physical sciences.** Toburen, L.H. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 79p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93013936. Source: OSTI; NTIS; INIS; GPO Dep.

This report is divided into the following sections, with technical sections in parentheses: dosimetry research (Chernobyl database, radon alpha irradiation of mammalian cells, cell growth rates in individual colonies), measurement science (ultrahigh resolution studies of molecular structure and dynamics, circular dichroism in hyperfine state resolved photoelectron angular distributions, Sr isotope shifts, capillary electrophoresis-mass spectrometry for DNA adduct research, rapid DNA sequencing techniques), and radiological and chemical physics (hit size effectiveness in radiation protection, track ends, cross sections for partially stripped ion impact, scaling of differential ionization cross sections, ionization by neutral projectiles, secondary electron emission from thin foils, stochastic model of ion track structure, stochastics of positive ion penumbra, plasmid structure and spontaneous strand separation, isolation and radiation sensitivity of DNA-synthesis-deficient CHO double mutants, semiempirical model of differential ionization cross sections for multishell atoms and molecules, ionization of DNA in solution, perturbations of DNA conformation by thymine glycol and dihydrothymine). 32 figs, 3 tabs.

27632 (PNL-SA–21596) **Eleventh DOE workshop on personnel neutron dosimetry.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health. [1991]. 182p. Sponsored by USDOE, Washington, DC (United States). (CONF-9106235–: 11. Department of Energy workshop on personnel neutron dosimetry, Las Vegas, NV (United States), 4-7 Jun 1991). Order Number DE93013824. Source: OSTI; NTIS; INIS; GPO Dep.

Since its formation, the Office of Health (EH-40) has stressed the importance of the exchange of information related to and improvements in neutron dosimetry. This Workshop was the eleventh in the series sponsored by the Department of Energy (DOE). It provided a forum for operational personnel at DOE facilities to discuss current issues related to neutron dosimetry and for leading investigators in the field to discuss promising approaches for future research. A total of 26 papers were presented including the keynote address by Dr. Warren K. Sinclair, who spoke on, "The 1990 Recommendations of the ICRP and their Biological Background." The first several papers discussed difficulties in measuring neutrons of different energies and ways of compensating or deriving correction factors at individual facilities. Presentations were also given by the US Navy and Air Force. Current research in neutron dosimeter development was the subject of the largest number of papers. These included a number on the development of neutron spectrometers.

27633 (PNL-SA–21677) **Quantitative Luminescence Imaging System.** Batishko, C.R.; Stahl, K.A.; Fecht, B.A. Pacific Northwest Lab., Richland, WA (United States). [1992]. 48p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-921281–1: Workshop on 3-dimensional graphics modeling of RFR distribution in humans, Brooks AFB, TX (United States), 8-9 Dec 1992). Order Number DE93015691. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of the MEASUREMENT OF CHEMILUMINESCENCE project is to develop and deliver a suite of imaging radiometric instruments for measuring spatial distributions of chemiluminescence. Envisioned deliverables include instruments working at the microscopic, macroscopic, and life-sized scales. Both laboratory and field portable instruments are envisioned. The project also includes development of phantoms as enclosures for the diazoluminomelanin (DALM) chemiluminescent chemistry. A suite of either phantoms in a variety of typical poses, or phantoms that could be adjusted to a variety of poses, is envisioned. These are to include small mammals (rats), mid-sized mammals (monkeys), and human body parts. A complete human phantom that can be posed is a long-term goal of the development. Taken together, the chemistry and instrumentation provide a means for imaging rf dosimetry based on chemiluminescence induced by the heat resulting from rf energy absorption. The first delivered instrument, the Quantitative Luminescence Imaging System (QLIS), resulted in a patent, and an R&D Magazine 1991 R&D 100 award, recognizing it as one of the 100 most significant technological developments of 1991. The current status of the project is that three systems have been delivered, several related studies have been conducted, two preliminary human hand phantoms have been delivered, system upgrades have been implemented, and calibrations have been maintained. Current development includes sensitivity improvements to the microscope-based system; extension of the large-scale (potentially life-sized targets) system to field portable applications; extension of the 2-D large-scale system to 3-D measurement; imminent delivery of a more refined human hand phantom and a rat phantom; rf, thermal and imaging subsystem integration; and continued calibration and upgrade support.

27634 (PNWD–2127-HEDR) **Approach for calculating population doses using the CIDER computer code.** Shipler, D.B. Pacific Northwest Lab., Richland, WA (United States). 29 Apr 1993. 7p. Sponsored by Department of Health and Human Services, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012828. Source: OSTI; NTIS; GPO Dep.

This report describes an approach for calculating radiation doses for the Hanford Environmental Dose Reconstruction Project. The approach utilizes the CIDER computer code.

27635 (RFP–4713) **Establishing interim authorization bases for resumption of plutonium operations.** Ealy, K.; Satterwhite, D. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. [1993]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. (CONF-9306143–7: Energy Facility Contractors Group safety analysis

meeting, Denver, CO (United States), 16-18 Jun 1993). Order Number DE93015362. Source: OSTI; NTIS; GPO Dep.

DOE Order 5480.23, Nuclear Safety Analysis Reports, requires that DOE facilities have an approved SAR (Safety Analysis Report). Rocky Flats Plant has a number of facilities for which no SAR exists. DOE Order 5480.21, Unreviewed Safety Questions, makes allowance for the operation of facilities without adequate SARs, through the establishment of an interim Authorization Basis (AB). In order to establish an AB, the nuclear facility must define the population of documents comprising the various elements of the AB and must use this defined population of documents as the basis for performing safety evaluations under DOE requirements. This short note explains the steps Rocky Flats Plant is taking to catalog the large body of documents available in order to establish an AB for those facilities needed to resume plutonium operations.

27636 (Riso-R–665(EN)) **Predicted effects of countermeasures on radiation doses from contaminated food.** Yamamoto, Hideaki (Japan Atomic Energy Research Institute (Japan)); Nielsen, S.P.; Nielsen, F. Risoe National Lab., Roskilde (Denmark). Environmental Science and Technology Dept. Feb 1993. [31p.] Order Number DE93630799. Source: OSTI; NTIS; INIS.

Quantitative assessments of the effects on radiation-dose reductions from nine typical countermeasures against accidental fod contamination have been carried out with dynamic radioecological models. The foodstuffs are assumed to be contaminated with iodine-131, caesium-134 and caesium-137 after a release of radioactive materials from the Ringhals nuclear power station in Sweden resulting from a hypothetical core melt accident. The release of activity of these radionuclides is assumed at 0.07% of the core inventory of the unit 1 reactor (1600 TBq of I-131, 220 TBq of Cs-134 and 190 TBq of Cs-137). Radiation doses are estimated for the 55,000 affected inhabitants along the south-eastern coast of Sweden eating locally produced foodstuffs. The average effective dose equivalent to an individual in the critical group is predicted to be 2.9 mSv from food consumption contaminated with I-131. An accident occurring during winter is estimated to cause average individual doses of 0.32 mSv from Cs-134 and 0.47 mSv from Cs-137, and 9.4 mSv and 6.8 mSv from Cs-134 and Cs-137, respectively, for an accident occurring during summer. Doses from the intake of radioiodine may be reduced by up to a factor of 60 by rejecting contaminated food for 30 days. For the doses from radiocaesium, the largest effect is found form deep ploughing which may reduce the dose by up to a factor of 80. (au) (12 tabs., 6 ills., 19 refs.).

27637 (SSI–92-03) **A reasonable price to prevent death caused by radiation induced neoplasms.** Bergman, C. Swedish Radiation Protection Inst., Stockholm (Sweden). Jan 1992. [17p.] (In Swedish). Order Number DE93630800. Source: OSTI; NTIS; INIS.

This paper discusses the risk based prioritization of radiation protection procedures versus the reduction of radiation induced neoplasms. An economic valuation of death reduction is necessary in many situations.

27638 (SSI–92-04) **Harmonization of models used for calculation of environmental transport and radiation doses.** Karlberg, Olof. Swedish Radiation Protection Inst., Stockholm (Sweden). Feb 1992. [24p.] (In Swedish). Order Number DE93631733. Source: OSTI; NTIS; INIS.

Models used for calculation of the environmental transport and radiation doses are presented. Differences between two models are discussed.

27639 (SSI–92-05) **Control of X-ray installations in hospitals.** Blomgren, P.G.; Hedberg Vikstroem, B. Swedish Radiation Protection Inst., Stockholm (Sweden). Mar 1992. [17p.] (In Swedish). Order Number DE93630795. Source: OSTI; NTIS; INIS.

171 quality controls of new installations of x-ray equipments have been performed. The results are summarized in this report. In average 22 percent of new installations were not approved at the first inspection.

27640 (SSI–92-09) **Measurement of radioactive wastes.** Karlberg, O.; Sandin, A.C. Swedish Radiation Protection Inst., Stockholm (Sweden). May 1992. [23p.] (In Swedish). Order Number DE93630808. Source: OSTI; NTIS; INIS.

The report presents the results of control measurement of intermediate-level and low-level radioactive wastes. Samples of encapsulated and processed radioactive wastes were controlled.

27641 (SSI–92-10) **Cost benefit of radiation protection.** Bengtsson, Gunnar (ed.). Swedish Radiation Protection Inst., Stockholm (Sweden). Mar 1992. [22p.] (In Swedish). Order Number DE93630801. Source: OSTI; NTIS; INIS.

The report discusses the cost benefit analysis necessary in the field of radiation protection.

27642 (SSI–92-16) **Biological effects of exposure to low frequency electric and magnetic fields.** Ahnstroem, G. (Stockholms Univ. (Sweden). Straalningsbiologiska Inst.). Swedish Radiation Protection Inst., Stockholm (Sweden). Oct 1992. [19p.] (In Swedish). Order Number DE93630732. Source: OSTI; NTIS; INIS.

The biological effects of exposure to low frequency electric and magnetic fields are reviewed with the objective of summarizing effects directly relevant to considerations of the health and safety of exposed people.

27643 (SSI–92-17) **Non-ionizing electromagnetic exposure assessment and dosimetry.** Paulsson, L.E. Swedish Radiation Protection Inst., Stockholm (Sweden). Nov 1992. [27p.] Order Number DE93630810. Source: OSTI; NTIS; INIS.

A comprehensive literature survey of advancements in the area 'human exposure assessment and dosimetry' for the years 1988-1992 has been performed by the author and published elsewhere. In the present report that material has been complemented with a historical background and a thorough description of the physical principles behind the methods and techniques. The report covers strategies, principles, methods, limitations and future developments for the area of human exposure assessment and dosimetry of electromagnetic fields form extremely low frequencies up to and including microwaves.

27644 (SSI–92-18) **Personnel dosimetry, 1991.** Bergman, Lars. Swedish Radiation Protection Inst., Stockholm (Sweden). Nov 1992. [12p.] (In Swedish). Order Number DE93630811. Source: OSTI; NTIS; INIS.

The report presents the results of the personnel dosimetry service during 1991. 12508 dosimeters were distributed. The results show that 7843 persons had received less than 0.1 mSv, 3864 persons between 0.1-1 mSv, 756 persons more than 1-5 mSv, and 39 persons more than 5 mSv.

27645 (STUK-A–108) **Residential radon survey in Finland.** Arvela, H.; Maekelaeinen, I.; Castren, O. Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). Feb 1993. [52p.] (In Finnish). Order Number DE93629423. Source: OSTI; NTIS; INIS.

The study measured the indoor radon concentration in the dwellings of 3074 persons, selected randomly from the central population register of Finland. Alpha track detectors and two consecutive half year measuring periods were used. The national mean of indoor radon concentration for persons living in low-rise residential buildings as well as blocks of flats was 145 and 82 Bq/m^3, respectively. The mean for the total population was 123 Bq/m^3. Based on the decision of the Ministry of Social Affairs and Health in 1992, the indoor radon concentration should not exceed 400 Bq/m^3 in already existing houses, the target for new construction being less than 200 Bq/m^3. According to the study, the percentage of the Finnish population living in houses with an indoor radon concentration exceeding 200, 400 and 800 Bq/m^3 was 12.3 %, 3.6 % and 1.0 %.

This project is concerned with the mechanisms by which polynuclear aromatic (PNA) compounds on the one hand, and ionizing radiation on the other, cause damage to DNA. PNA compounds constitute an important class of environmental pollutants derived from energy-related sources which, upon metabolic activation to diolepoxide derivatives, produce bulky PNA-DNA lesions interfere with the normal DNA replication and transcription processes, and give rise to mutations and the initiation of tumors. Chiral and other stereochemical effects play a key role in determining the biological effects of a given PNA diol epoxide and the potentially mutagenic lesions which are formed. New and efficient methods for synthesizing stereochemically pure and precisely positioned PNA diol epoxide-DNA lesions in small DNA fragments are reported here. We have elucidated the structures of three stereoisomeric benzo[a]pyrene diol epoxide-DNA adducts. How these adducts affect on DNA polymerase fidelity, transcription, and DNA repair are currently being investigated with respect to detailed structure-biological activity correlations. Spectroscopic techniques such as circular dichroism, fluorescence, and photoionization play an important role in the characterizations of the PNA adducts. A new method was developed for measuring the lifetimes as well as the energies of picosecond duration electronically excited states. Using this technique, it is proposed that short-lived (15 ps) charge-transfer (CT) states in the PNA compound tetracene are activated by a 20 ps laser pulse; an unusual external photoemission echo do to the recombination of CT states is observed 85 ps after the pulse.

27648 (DOE/ER/61228–T1) **Center of Excellence in laser medicine: Progress performance report.** Parrish, J.A. Massachusetts General Hospital, Boston, MA (United States). Wellman Labs. of Photomedicine. 29 Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER61228. Order Number DE93016541. Source: OSTI; NTIS; GPO Dep.

Achievements during the last 12 months of funding to initiate a Center of Excellence in biomedical laser development include: seven specific research projects within the Center's three broad interest areas, and program development to establish the MGH Laser Center and its activities. Progress in the three interest areas namely new medical laser systems development, optical diagnostics and photo sensitization is reported. Feasibility studies and prototype development were emphasized, to enhance establishing a substantial Center through future support. Specific projects are outlined below. In addition, the interdepartmental MGH Laser Center's activities and accomplishments.

27649 (LA-UR–93-1165) **DM-CSF stimulated proliferation of rat alveolar macrophages and the effects of differing particulate burden levels in alveolar macrophages on the proliferative response.** Pendergrass, D.; Valdez, Y.E.; Lehnert, B.E. Los Alamos National Lab., NM (United States). [1993]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9303155–1: 4. international inhalation symposium on toxic and carcinogenic effects of solid particles in the respiratory tract, Hanover (Germany), 1-5 Mar 1993). Order Number DE93012629. Source: OSTI; NTIS; GPO Dep.

Particles are gradually redistributed among the lung's population of alveolar macrophages (AM) at times well after they were originally deposited in the lung. One mechanism that may underlie this "particle redistribution phenomenon" is the in situ replication of particle-containing AM and the allocation of particles from dividing AM to daughter cells. Little is known about how the abilities of AM to proliferate may be affected by the containment of particles; conceivably, AM proliferation may be a particle burden-dependent process. In this study, we assessed the proliferative abilities of AM that contain differing burdens of phagocytized particles. Rats were intratracheally instilled with 2×10^8 fluorescent, polystyrene microspheres (~2 μM diam.), and several days thereafter their lungs were lavaged. The lavaged AM were analyzed using a multiparameter flow cytometer, and the AM were sorted according to their relative burdens of microspheres, i.e., low burdens, medium burdens, high burdens, based on their levels of fluorescence intensities. Control cells consisted of AM that were lavaged from the lungs of untreated animals and also passed through the flow cytometer. The sorted AM were then cultured in the presence of 0.3 ng/ml Granulocyte/Macrophage Colony-Stimulating Factor and cultured for up to 15 days. Control cells and the sorted AM all replicated similarly; no evidence was found to indicate that AM proliferation is either stimulated or decreased. Evidence was also obtained that indicated that when particle-containing AM divide, the particles they originally contained are distributed to their offspring.

27650 (ORNL/FTR–4290) **Travel to Luso, Portugal, to participate in the NATO Advanced research workshop on the use of biomarkers to assess human health and environmental impacts from exposure to chemical pollutants: Foreign trip report, May 30, 1992–June 9, 1992.** White, R.K. Oak Ridge National Lab., TN (United States). 22 Jun 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011075. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the workshop, Use of Biomarkers in Assessing Health and Environmental Impacts of Chemical Pollutants participating in numerous discussions with NATO scientists and researchers on the definition and character of biomarkers, analytical methods for identifying and measuring the presence of biomarkers, and the use of such markers as indicators of the health of the exposed system. Papers of particular interest to the Oak Ridge National Laboratory health risk assessment program are those discussing the use of biomarkers to indicate the health status of populations surrounding hazardous waste sites in Denver, Colorado, and in two Belgian cities. In addition, the work of several attendees in linking specific genetic biomarkers to specific tumor types and incidence indicate important advances in the use of biomarkers to link environmental exposures to specific disease states. Further refinement and advancement of these techniques will greatly advance human health risk assessment techniques.

27651 (UCRL-JC–111534) **Studies on DNA adduction with heterocyclic amines by accelerator mass spectroscopy (AMS): A new technique for tracing isotope labeled DNA adduction.** Turteltaub, K.W.; Vogel, J.S.; Frantz, C.E.; Fultz, E. Lawrence Livermore National Lab., CA (United States). 29 Sep 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9206374–1: Workshop on post-labeling methods on DNA adducts, Lyon (France), 24-27 Jun 1992). Order Number DE93012589. Source: OSTI; NTIS; GPO Dep.

The influence of dose on the biological damage caused by exposure to xenobiotics has long been a subject of controversy in toxicology. Of particular recent interest has been the interaction of chemical carcinogens with DNA and the relationship between DNA adduction, chemical exposure, and cancer risk. We are studying DNA adduction in rodents at doses equivalent to human dietary exposure (10^4–10^6-fold lower than laboratory studies) using accelerator mass spectrometry (AMS). AMS is a nuclear physics technique for detection of cosmogenic isotopes and has been used for specifically selecting and counting ^{14}C. Using AMS, DNA adducts are detectable at levels of 1–10 adducts/10^{12} nucleotides following acute and chronic dosing regimes with ^{14}C-labeled carcinogens. The adduct detection limit has been imposed by the natural abundance of ^{14}C in the samples and animal to animal variation. AMS is also being coupled to HIPLC, multi-dimensional TLC, and radio-immunoassay. In addition, AMS's great sensitivity makes it useful for demonstrating that drugs and chemicals don't bind DNA. The use of AMS, however, is limited to situations where radio-labeled agents can be used. These data suggest that AMS is

extremely useful in obtaining quantitative data on the effects of carcinogens on DNA at the low doses common for actual human exposures and may be useful in human studies.

27652 (CONF-9303182–1) **Current distribution tomography for determination of internal current density distributions.** Gailey, P.C. Oak Ridge National Lab., TN (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Applied Computational Electromagnetic Society (ACES) meeting; Monterey, CA (United States); 24 Mar 1993. Order Number DE93015463. Source: OSTI; NTIS; INIS; GPO Dep.

A method is presented for determination of current densities inside a cylindrical object using measurements of the magnetic fields outside the object. The cross section of the object is discretized with the current assumed constant over each defined region. Magnetic fields outside the object are related to the internal current densities through a geometry matrix which can be inverted to yield a solution for the current densities in terms of the measured fields. The primary limitation of this technique results from singularities in the geometry matrix that arise due to cylindrical symmetry of the problem. Methods for circumventing the singularities to obtain information about the distribution of current densities are discussed. This process of current distribution tomography is designed to determine internal body current densities using measurements of the external magnetic field distribution. It is non-invasive, and relatively simple to implement. Although related to a more general study of magnetic imaging which has been used to investigate endogenous currents in the brain and other parts of the body, it is restricted to currents either applied directly or induced by exposure to an external field. The research is related to public concern about the possibility of health effects resulting from exposure to power frequency electric and magnetic fields.

27653 (EGG–10617-2164) **San Joaquin kit fox (Vulpes velox macrotis) program, Camp Roberts, California: Progress report, fiscal years 1991–1992.** EG and G Energy Measurements, Inc., Goleta, CA (United States). Santa Barbara Operations. Oct 1992. 40p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC08-88NV10617. Order Number DE93011249. Source: OSTI; NTIS; INIS; GPO Dep.

The major objective of the Camp Roberts Environmental Studies Program was to prepare a comprehensive Biological Assessment of the effects of all NGB-authorized activities on San Joaquin kit fox (military training, anticipated construction projects, repair and maintenance activities, and all NGB-authorized non-military activities such as a hunting and fishing program, grazing leases, etc.). The program also provided NGB with the scientific expertise necessary to ensure compliance with the Endangered Species Act. The objective of this report is to summarize the progress and results of the Environmental Studies Program during Fiscal Years 1991 and 1992 (FY91/92).

27654 (LUNBDS-NBLI–93-1025) **Asellus and Gammarus spp. (Crustacea) in changing environments: effects of acid stress and habitat permanence.** Hargeby, A. Lund Univ. (Sweden). Dept. of Ecology. Mar 1993. 17 p.p. Order Number DE93500855. Source: OSTI; NTIS.

The research underlying this thesis included laboratory and field studies on how acid stress affects the benthic crustaceans Asellus aquaticus L. and Gammarus pulex (L.). A laboratory chamber was constructed to study growth and survival of G. pulex during acid stress. Low pH (6.0) caused 64-92% mortality within three weeks and reduced growth rate and food conversion efficiency in surviving animals. In a field experiment along a pH gradient, the mortality of G. pulex increased below pH 6. The whole-body content of sodium and potassium was reduced in surviving individuals, indicating osmoregulatory disturbance. In Asellus aquaticus, mortality was not affected by pH within the tested range (4.3-7.5). Laboratory experiments showed that interspecific interactions between A. aquaticus and G. pulex can include both exploitative competition and predation by G. pulex on A. aquaticus. Effects of seasonal habitat alterations was studied in a lake by comparing invertebrate assemblages associated with two species of submerged macroalgae (Characea), one perennial and one senescent during autumn. (28 refs.).

57 HEALTH AND SAFETY

27655 (ANL/EAIS/CP–79460) **A risk-based approach to cost-benefit analysis of software safety activities.** Fortier, S.C. (Intermetrics, Inc., McLean, VA (United States)); Michael, J.B. Argonne National Lab., IL (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9306161–1: 8. annual conference on computer assurance, Gaithersburg, MD (United States), 14-17 Jun 1993). Order Number DE93012897. Source: OSTI; NTIS; GPO Dep.

Assumptions about the economics of making a system safe are usually not explicitly stated in industrial and software models of safety-critical systems. These assumptions span a wide spectrum of economic tradeoffs with respect to resources expended to make a system safe. The missing component in these models that is necessary for capturing the effect of economic tradeoffs is risk. A qualitative risk-based software safety model is proposed that combines features of industrial and software systems safety models. The risk-based model provides decision makers with a basis for performing cost-benefit analyses of software safety-related activities.

27656 (DOE–76-45/5-Rev.1) **Reported Significant Observation (RSO) studies: Revision 1.** Eicher, R.W. EG and G Idaho, Inc., Idaho Falls, ID (United States). System Safety Development Center. Dec 1992. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (SSDC–5-Rev.1). Order Number DE93013589. Source: OSTI; NTIS; GPO Dep.

The Reported Significant Observation (RSO) study used in the field of safety is an information-gathering technique where employee-participants describe situations they have personally witnessed involving good and bad practices and safe and unsafe conditions. This information is useful in the risk assessment process because it focuses on hazards and thereby facilitates their elimination. However, RSO cannot be the only component in a risk assessment program. Used by the Air Force in their aviation psychology program and further developed by John C. Flanagan, RSO is more commonly known as the "Critical Incident Technique." However, the words "Critical" and "Incident" had other connotations in nuclear safety, prompting early users within the Aerojet Nuclear Company to coin the more fitting title of "Reported Significant Observations." The technique spread slowly in the safety field primarily because the majority of users were researchers interested in after-the-fact data, with application to everyday problems and behavioral factors. RSO was formally recognized as a significant hazard reduction tool during the development of the Management Oversight and Risk Tree (MORT) program for the US Atomic Energy Commission. The Department of Energy (DOE) has, in turn, adopted MORT for its system safety program, and this has resulted in RSO being a modern and viable technique for DOE contractor safety programs.

27657 (DOE–76-45/13-Rev.1) **Management factors in accident and incident prevention (including management self-evaluation checklists): Revision 1.** Nertney, R.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). System Safety Development Center. Feb 1993. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (SSDC–13-Rev.1). Order Number DE93013777. Source: OSTI; NTIS; GPO Dep.

Serious accidents and incidents occurring within the Department of Energy (DOE) will be investigated by committees including DOE trained investigators. A part of the investigation includes evaluation of management systems as they relate to the accident. The purpose of this guide is to outline, for general management, those management factors which have been found to be of importance in

accident prevention. These factors will, of course, will be studied by investigating teams. The management factors have been selected, through a ten-year, world-wide consensus process, as those which individually and collectively may represent accident/incident causal factors. It is the task of the investigating board or committee to determine which of these factors are, indeed, involved in a given accident or incident. Objectives of the guide are twofold: To provide a means for accident/incident prevention by familiarizing managers with the management-related accident/incident causal factors that have been revealed in accident investigation research. To help prepare line and project managers for the investigative process by making them aware of the factors that will be investigated.

27658 (DOE/CH/10324–T19) **Southern state radiological emergency preparedness and response agencies.** Southern States Energy Board, Norcross, GA (United States). Nov 1988. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016316. Source: OSTI; NTIS; INIS; GPO Dep.

This Report provides information on the state agencies assigned to radioactive materials transportation incidents in 16 Southern States Energy Board member states. For each, the report lists the agencies with primary authority for preparedness and response, their responsibilities and personnel within the agencies who can offer additional information on their radioactive materials transportation programs. The report also lists each state's emergency team members and its laboratory and analytical capabilities. Finally, the governor's designee for receiving advance notification of high-level radioactive materials and spent fuel shipments under 10 CFR Parts 71 and 73 of the US Nuclear Regulatory Commission's regulations is listed for each state. Part 71 requires prenotification for large quantity radioactive waste shipments. Part 73 addresses prenotification for spent nuclear reactor fuel shipments.

27659 (EGG-M–93017) **Who's protecting you from hazardous substances?.** Perry, D.S. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9303168–1: 1993 regional hazardous wastes and materials conference, Pacatello, ID (United States), 29-31 Mar 1993). Order Number DE93013667. Source: OSTI; NTIS; INIS; GPO Dep.

Employee accidents, life endangering spills of harmful chemicals, toxic materials leaching into drinking water, polluted air, crippling side effects of wonder metals and products, and human and animal deaths made it apparent that in order to protect and preserve the community and the environment, the community needed to be aware/knowledgeable of chemical uses and related possible dangers, i.e., it was time to establish rules and regulations for the use and disposal of hazardous substances and chemicals. This report details several organizations, acts, rules, and regulations created in the interest of hazardous materials safety.

27660 (EGG-M–93090) **Ergonomic assessments of three Idaho National Engineering Laboratory cafeterias.** Ostrom, L.T.; Romero, H.A.; Gilbert, B.G.; Wilhelmsen, C.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9304143–1: Occupational ergonomic annual symposium, Lubbock, TX (United States), 16-17 Apr 1993). Order Number DE93013513. Source: OSTI; NTIS; GPO Dep.

The Idaho National Engineering Laboratory is a Department of Energy facility that performs a variety of engineering and research projects. EG&G Idaho is the prime contractor for the laboratory and, as such, performs the support functions in addition to technical, research, and development functions. As a part of the EG&G Idaho Industrial Hygiene Initiative, ergonomic assessments were conducted at three Idaho National Engineering Laboratory Cafeterias. The purposes of the assessments were to determine whether ergonomic problems existed in the work places and, if so, to make recommendations to improve the work place and task designs. The study showed there were ergonomic problems in all three cafeterias assessed. The primary ergonomic stresses observed included wrist and shoulder stress in the dish washing task, postural stress in the dish washing and food preparation tasks, and back stress in the food handling tasks.

27661 (RFP–4599) **Hydrogen peroxide safety issues.** Conner, W.V. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. 14 Apr 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. Order Number DE93013895. Source: OSTI; NTIS; INIS; GPO Dep.

A literature survey was conducted to review the safety issues involved in handling hydrogen peroxide solutions. Most of the information found in the literature is not directly applicable to conditions at the Rocky Flats Plant, but one report describes experimental work conducted previously at Rocky Flats to determine decomposition reaction-rate constants for hydrogen peroxide solutions. Data from this report were used to calculate decomposition half-life times for hydrogen peroxide in solutions containing several decomposition catalysts. The information developed from this survey indicates that hydrogen peroxide will undergo both homogeneous and heterogeneous decomposition. The rate of decomposition is affected by temperature and the presence of catalytic agents. Decomposition of hydrogen peroxide is catalyzed by alkalies, strong acids, platinum group and transition metals, and dissolved salts of transition metals. Depending upon conditions, the consequence of a hydrogen peroxide decomposition can range from slow evolution of oxygen gas to a vapor, phase detonation of hydrogen peroxide vapors.

27662 (DOE/ER/13749–4) **[Investigation of ultrasonic wave interaction with porous saturated rocks].** Ohio State Univ. Research Foundation, Columbus, OH (United States). Dept. of Welding Engineering. [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER13749. Order Number DE93016261. Source: OSTI; NTIS; GPO Dep.

During the last year we have continued our investigation of ultrasonic wave propagation in fluid-filled porous materials. Previously, we studied the feasibility of using different surface modes to characterize both synthetic and natural rocks. We introduced a novel experimental technique based on the direct generation of surface waves by edge excitation. At first, we used two low-frequency (100–500 kHz) shear transducers in pitch-catch mode to launch and receive the ultrasonic surface wave. The contact transducers were coupled to the opposite edges of the porous specimens with normal polarization relative to the surface. The same technique was successfully used to generate Rayleigh-type surface modes on the free surface of both dry and water-saturated specimens, as well as Stoneley-type interface modes on the fluid-loaded surfaces of immersed samples. Recently, we developed a special interferometric technique for non-contact detection of ultrasonic vibrations on diffusely reflecting rough surfaces. This method was found to be more suitable for surface wave inspection of porous ceramics and natural rocks than the previously used contact techniques. Beside investigating guided acoustic waves in water-saturated porous materials, we also studied bulk wave propagation in air-saturated specimens. We further developed our experimental technique which is based on the transmission of airborne ultrasonic waves through air-filled porous plates. This method can be readily used to study the frequency-dependent propagation properties of slow compressional waves in different porous materials including natural rocks. By simple technical improvements, we extended the measuring range so that we could continuously cover both low-frequency (diffuse) and high-frequency (propagating) regimes of slow wave propagation.

27663 (DOE/ER/14079–24) **Computational methods for improving the resolution of subsurface seismic images: Progress report, September 15, 1991–September 14, 1993.** Larner, K.; Hale, D.; Bleistein, N.; Cohen, J. Colorado School of

Mines, Golden, CO (United States). May 1993. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER14079. Order Number DE93015882. Source: OSTI; NTIS; GPO Dep.

Our interactive modeling for Gaussian beam modeling in two-dimensional, triangulated complex geologic structure, has been generalized to include transmission losses at interfaces, and density and Q-characterization of attenuation in layers. Also, multiple reflections and the option to model data from VSP acquisition geometry have been included. Shortcomings when the structure contains first-order discontinuities, however, limit the full geologic complexity that presently can be modeled by the Gaussian beam method. Other studies of wave filtering that arises for waves propagating nearly parallel to bedding reveal the importance of tunneling evanescent filtering on the propagating wavelet. Likewise, for reflections from steep interfaces, we have developed a dip-divergence correction to compensate for shortcomings in the conventional divergence correction for energy spreading. A new direction this past year, which we will be pursuing in the year ahead is analysis of errors in migration and dip-moveout (DMO) that arise when conventional imaging processing, which ignores anisotropy, is applied to data acquired where the subsurface is transversely isotropic. We are also developing approaches for taking anisotropy into account in these important imaging processes. Similarly, we have developed an efficient approach to performing DMO on P-SV-mode-converted data. Our interests in taking anisotropy into account have led us to study the importance of anisotropy in the overburden on reflection amplitude variations with offset (AVO).

27664 (DOE/FTR–93012692) **[Travel to New Zealand for studies in electromagnetic inversion applied to the earth and its relevance to environmental remediation]: Foreign trip report, August 23–September 12, 1992.** Newman, G.A. Sandia National Labs., Albuquerque, NM (United States). 14 Sep 1992. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012692. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Workshop sessions and field trips are described are described briefly. A list of participants is included.

27665 (DOE/ID/13042–6) **Impeller flow-meter logging of vertical cross flow between basalt aquifers through wells at the Idaho National Engineering Laboratory, Eastern Snake River Plain, Idaho: Progress report, June 22, 1992.** Bennecke, W.M.; Wood, S.H. Boise State Univ., ID (United States). Dept. of Geosciences. [1992]. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-91ID13042. Order Number DE93012945. Source: OSTI; NTIS; INIS; GPO Dep.

An impeller flowmeter was used with a COLOG digital acquisition system to determine existing borehole flows, to compare with previous logging results, and to acquire flow measurements of vertical cross-flow of water in the wells between permeable zones in the open-hole intervals. The direction of flow found was predominantly downward with velocities ranging from 0-30 ft/min. Some flow reversals were noted and attributed to nearby pumping wells. USGS wells 44 and 46 were studied in September, 1991 near the Idaho Chemical Processing Plant (ICPP). The results showed a usual overall flow direction downward with flow entering the wells at around 510 to 600 ft. below the land surface. Water exited these wells at lower levels around 550 to 580 ft. Flow velocities ranged up to 24 ft/min. Using published aquifer parameters, the rate of propagation of a pressure change in an aquifer was calculated for the well CPP-2 turning on and off, at 3100 gpm.

27666 (IC–93/78) **Advanced criteria of seismic zoning and synthetic seismograms.** Panza, G.F. (International Centre for Theoretical Physics, Trieste (Italy)); Vaccari, F. International Centre for Theoretical Physics, Trieste (Italy). Apr 1993. [30p.] Contract CNR 91-02550-PF54;CNR 91-02539-PF54. Order Number DE93627954. Source: OSTI; NTIS (US Sales Only); INIS.

A brief revision of the traditional deterministic and probabilistic methods of first order seismic zonation, outlining their limits and possibilities, indicates that they can only lead to a kind of "post-event" zonation, which has a limited local validity. The strong influence of laterial heterogeneities and of source properties on the spatial distribution of Peak Ground Acceleration (PGA) and of the Total Energy of ground motion (W), indicates that the traditional methods require a deep revision. The method we have developed and applied to a first-order seismic zoning of the whole Italian territory and to the microzoning of specific objects, being based on the computation of synthetic seismograms, makes it possible and necessary to take source and propagation effects into account, fully utilizing the large amount of geological and geotechnical data, already available. Even though it falls in the domain of deterministic approaches, the method is very suitable for inclusion in the definition of new integrated procedures which combine probabilistic and deterministic approaches and allow us to minimize the present drawbacks which characterise the two methods when they are considered separately. If the seismotectonic regime is well known, a very important practical aspect of our deterministic approach is the immediate capability to direct the rescue intervention of the Civil Defence where the greatest damage is expected, by drawing post-event synthetic isoseismals for the source regions. Detailed modelling of ground motion for realistic two-dimensional media is a low-cost but very powerful tool for the prevention aspects of Civil Defence since it allows the computation of realistic seismic input for important structures based on the definition of a wide set of possible scenarios, which can be immediately used in the design of new seismo-resistant constructions and in the reinforcement of existing structures. (author). 65 refs, 14 figs.

27667 (LBL–33830) **Predicting the transport properties of sedimentary rocks from microgeometry.** Schlueter, E.M. Lawrence Berkeley Lab., CA (United States). Jan 1993. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098 ;AC22-89BC14475. Order Number DE93015224. Source: OSTI; NTIS; GPO Dep.

We investigate through analysis and experiment how pore geometry, topology, and the physics and chemistry of mineral-fluid and fluid-fluid interactions affect the flow of fluids through consolidated/partially consolidated porous media. Our approach is to measure fluid permeability and electrical conductivity of rock samples using single and multiple fluid phases that can be frozen in place (wetting and nonwetting) over a range of pore pressures. These experiments are analyzed in terms of the microphysics and microchemistry of the processes involved to provide a theoretical basis for the macroscopic constitutive relationships between fluid-flow and geophysical properties that we develop. The purpose of these experiments and their analyses is to advance the understanding of the mechanisms and factors that control fluid transport in porous media. This understanding is important in characterizing porous media properties and heterogeneities before simulating and monitoring the progress of complex flow processes at the field scale in permeable media.

27668 (SAND–93-0823C) **Rapid acquisition of high resolution full wave-field borehole seismic data.** Sleefe, G.E. (Sandia National Labs., Albuquerque, NM (United States)); Harding, R.S. Jr.; Fairborn, J.W.; Paulsson, B.N.P. Sandia National Labs., Albuquerque, NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930901–2: Annual meeting of the Society of Exploration Geophysicists, Washington, DC (United States), 26-30 Sep 1993). Order Number DE93011667. Source: OSTI; NTIS; GPO Dep.

An essential requirement for both Vertical Seismic Profiling (VSP) and Cross-Hole Seismic Profiling (CHSP) is the rapid acquisition of high resolution borehole seismic data. Additionally, full wave-field recording using three-component receivers enables the use of both transmitted and reflected elastic wave events in the resulting seismic images of the subsurface. To this end, an advanced three- component multi-station borehole seismic receiver system has been designed and developed by Sandia National Laboratory (SNL) and OYO Geospace. The system requires data from multiple three-component wall-locking accelerometer packages and telemeters digital data to the surface in real-time. Due to the multiplicity of measurement stations and the real-time data link, acquisition time for the borehole seismic survey is significantly reduced. The system was tested at the Chevron La Habra Test Site using Chevron's clamped axial borehole vibrator as the seismic source. Several source and receiver fans were acquired using a four-station version of the advanced system. For comparison purposes, an equivalent

data set was acquired using a standard analog wall-locking geophone receiver. The test data indicate several enhancements provided by the multi-station receiver relative to the standard, drastically improved signal-to-noise ratio, increased signal bandwidth, the detection of multiple reflectors, and a true 4:1 reduction in survey time.

27669 (UCRL-JC–109870) **Exploratory data analysis on the Macintosh.** Grotch, S.L. Lawrence Livermore National Lab., CA (United States). Apr 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9206372–1: 12. conference on probability and statistics in the atmospheric sciences, Ontario (Canada), 22-26 Jun 1992). Order Number DE93013043. Source: OSTI; NTIS; GPO Dep.

The past few years have seen a virtual revolution in computing, particularly in the area of small computers. For statistical and graphical data analysis, intense commercial competition has lead to the availability of a wide variety of general purpose statistical and graphical packages with extraordinary versatility and capabilities. This work will examine two of these currently available software systems as applied by the author to a variety of climate research tasks. This work is not an attempt to either provide an exhaustive survey or to rank available software as to "best," or to serve as an endorsement of any particular software, but rather to illustrate, through real examples, some of the power now available to the researcher through such software. For a more detailed, feature by feature intercomparison of several statistical packages, see two recent surveys: Seiter and Best and Moganstein. Attention here is focused on the Macintosh computer, primarily because of its wide availability and ease of interaction. Two packages that provide some particularly novel capabilities are illustrated: for statistics, Data Desk; and for graphics, Spyglass.

66 PHYSICS

27670 (SSCL-Preprint–209) **An ASD Physics Education Program.** Barton, H.R. Jr. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–16: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014131. Source: OSTI; NTIS; INIS; GPO Dep.

I want to thank the Organizing Committee and Program Chairman of the 1993 IISSC for providing this forum to discuss science education issues here in San Francisco. By all accounts, science education in the United States is in trouble. Clearly, teaching science to the young people of our country is an important goal shared by all of us involved in scientific research. The Director, Dr. Roy Schmitters, has made science education a Laboratory goal for the Supercollider. Those of us who share this goal only can have an impact if we become involved actively in teaching science to the future engineers and scientists enrolled at our colleges and universities. The commitment of IISSC to science education is welcomed by everyone of us who wishes to improve the technological base of the nation for the next generation.

6611 Classical and Quantum Mechanics

27671 (DOE/ER/40757–004) **The geometric phase in quantum physics.** Bohm, A. Texas Univ., Austin, TX (United States). Center for Particle Physics. Mar 1993. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-93ER40757. (CONF-9206360–1: North Atlantic Treaty Organization (NATO)-ASI meeting on recent problems in mathematical physics, Salamanca (Spain), Jun 1992). Order Number DE93011121. Source: OSTI; NTIS; INIS; GPO Dep.

After an explanatory introduction, a quantum system in a classical time-dependent environment is discussed; an example is a magnetic moment in a classical magnetic field. At first, the general abelian case is discussed in the adiabatic approximation. Then the geometric phase for nonadiabatic change of the environment (Anandan–Aharonov phase) is introduced, and after that general cyclic (nonadiabatic) evolution is discussed. The mathematics of fiber bundles is introduced, and some of its results are used to describe the relation between the adiabatic Berry phase and the geometric phase for general cyclic evolution of a pure state. The discussion is restricted to the abelian, U(1) phase.

27672 (IC–93/43) **Steepest descent approximations for accretive operator equations.** Chidume, C.E. International Centre for Theoretical Physics, Trieste (Italy). Mar 1993. [19p.] Order Number DE93628586. Source: OSTI; NTIS (US Sales Only); INIS.

A necessary and sufficient condition is established for the strong convergence of the steepest descent approximation to a solution of equations involving quasi-accretive operators defined on a uniformly smooth Banach space. (author). 49 refs.

27673 (IC–93/54) **On a possible algebra morphism of $U_q[osp(1/2)]$ onto the deformed oscillator algebra $W_q(N)$.** Palev, T.D.; Stoilova, N.I. International Centre for Theoretical Physics, Trieste (Italy). Mar 1993. [8p.] Order Number DE93629857. Source: OSTI; NTIS (US Sales Only); INIS.

We formulate a conjecture, stating that the algebra of n pairs of deformed Bose creation and annihilation operators is a factor-algebra of $U_q[osp(1/2n)]$, considered as a Hopf algebra, and prove it for n=2 case. To this end we show that for any value of $qU_q[osp(1/4)]$ can be viewed as a superalgebra, freely generated by two pairs $B_1^{\pm}$, $B_2^{\pm}$ of deformed para-Bose operators. We write down all Hopf algebra relations, an analogue of the Cartan-Weyl basis, the "commutation" relations between the generators and a basis in $U_q[osp(1/2n)]$ entirely in terms of $B_1^{\pm}$, $B_2^{\pm}$. (author). 21 refs.

27674 (IC–93/72) **Global solutions to a system of strongly coupled reaction-diffusion equations.** Kirane, M. (International Centre for Theoretical Physics, Trieste (Italy)); Kouachi, S. International Centre for Theoretical Physics, Trieste (Italy). Apr 1993. [13p.] Order Number DE93628587. Source: OSTI; NTIS (US Sales Only); INIS.

The paper discusses the existence of globally bounded in time classical solutions for a system of strongly coupled reaction-diffusion equations under homogenous boundary conditions. 17 refs.

27675 (IC–93/79) **Distributively generated matrix near rings.** Abbasi, S.J. International Centre for Theoretical Physics, Trieste (Italy). Apr 1993. [4p.] Order Number DE93628588. Source: OSTI; NTIS (US Sales Only); INIS.

It is known that if R is a near ring with identity then (I,+) is abelian if (I^*,+) is abelian and (I,+) is abelian if (I^*,+) is abelian [S.J. Abbasi, J.D.P. Meldrum, 1991]. This paper extends these results. We show that if R is a distributively generated near ring with identity then (I,+) is included in Z(R), the center of R, if (I^*,+) is included in $Z(M_n(R))$, the center of matrix near ring $M_n(R)$. Furthermore (I,+) is included in Z(R) if (I^*,+) is included in $Z(M_n(R))$. (author). 5 refs.

27676 (IC–93/82) **Asymptotic behaviour of firmly non expansive sequences.** Rouhani, B.D. International Centre for Theoretical Physics, Trieste (Italy). Apr 1993. [11p.] Order Number DE93628589. Source: OSTI; NTIS (US Sales Only); INIS.

We introduce the notion of firmly non expansive sequences in a Banach space and present several results concerning their asymptotic behaviour extending previous results and giving an affirmative answer to an open question raised by S. Reich and I. Shafir. Applications to averaged mappings are also given. (author). 16 refs.

27677 (IC–93/93) **Quantum Heisenberg groups and Sklyanin algebras.** Andruskiewitsch, N. (Max-Planck-Inst. fuer Mathematik, Bonn (Germany)); Devoto, J.; Tiraboschi, A. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [13p.] Order Number DE93628590. Source: OSTI; NTIS (US Sales Only); INIS.

We define new quantizations of the Heisenberg group by introducing new quantizations in the universal enveloping algebra of its Lie algebra. Matrix coefficients of the Stone-von Neumann representation are preserved by these new multiplications on the algebra of functions on the Heisenberg group. Some of the new quantizations provide also a new multiplication in the algebra of theta functions; we obtain in this way Sklyanin algebras. (author). 23 refs.

27678 (IC–93/96) **Fixed point iterations for strictly hemi-contractive maps in uniformly smooth Banach spaces.** Chidume, C.E.; Osilike, M.O. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [14p.] Order Number DE93628591. Source: OSTI; NTIS (US Sales Only); INIS.

It is proved that the Mann iteration process converges strongly to the fixed point of a strictly hemi-contractive map in real uniformly smooth Banach spaces. The class of strictly hemi-contractive maps includes all strictly pseudo-contractive maps with nonempty fixed point sets. A related result deals with the Ishikawa iteration scheme when the mapping is Lipschitzian and strictly hemi-contractive. Our theorems generalize important known results. (author). 29 refs.

27679 (IC–93/97) **Steepest descent method for set-valued locally accretive mappings.** Chidume, C.E. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [12p.] Order Number DE93628592. Source: OSTI; NTIS (US Sales Only); INIS.

Let E be a real q-uniformly smooth Banach space. Suppose T is a set-valued locally strongly accretive map with open domain D(T) in E and that 0 is an element of Tx has a solution x^* in D(T). Then there exists a neighbourhood B in D(T) of x^* and a real number $r_1>0$ such that for any $r>r_1$ and some real sequence $\{c_n\}$, any initial guess x_1 is an element of B and any single-valued selection T_0 of T, the sequence $\{x_n\}$ generated from x_1 by $x_{n+1}=x_n-c_nT_0x_n$, $n\geq 1$, remains in D(T) and converges strongly to x^* with ——x_n-x^*—— $O(n^{-(q-1)/q})$. A related result deals with iterative approximation of a solution of the equation f is an element of x+Ax when A is a locally accretive map. Our theorems generalize important known results and resolve a problem of interest. (author). 39 refs.

27680 (IC–93/100) **Self-sustained solitons in systems with nonlinear damping.** Gonzalez, J.A. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [9p.] Order Number DE93628583. Source: OSTI; NTIS (US Sales Only); INIS.

The existence and stability of kinks in systems with nonlinear damping are investigated. We discuss the mechanism of a bifurcation after which the kink becomes a non-stationary state. (author). 9 refs.

27681 (IC–93/104) **Classical relativistic spinning particle with anomalous magnetic moment: The precession of spin.** Barut, A.O.; Cruz, M.G. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [15p.] Order Number DE93628584. Source: OSTI; NTIS (US Sales Only); INIS.

The theory of classical relativistic spinning particles with c-number internal spinor variables, modelling accurately the Dirac electron, is generalized to particles with anomalous magnetic moments. The equations of motion are derived and the problem of spin precession is discussed and compared with other theories of spin. (author). 32 refs.

27682 (IC–93/106) **Diffraction and interference of single de Broglie-wavelets. Deterministic wave mechanics.** Barut, A.O. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [16p.] Order Number DE93631750. Source: OSTI; NTIS (US Sales Only); INIS.

Wavelets are localized nonspreading solutions of massless wave equations which move like massive quantum particles. They form a bridge between classical mechanics of point particles and wave functions of probabilistic quantum mechanics, both of which can be obtained by limiting processes. Here we develop a theory of the propagation of wavelets in the presence of boundaries and derive interference phenomena of quantum theory from the behavior of single events with "hidden parameters". (author). 8 refs, 1 fig.

27683 (IC–93/108) **On a class of singular quasilinear elliptic equations with general structure and distribution data.** Le Dung. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [25p.] Order Number DE93628585. Source: OSTI; NTIS (US Sales Only); INIS.

We present a $C^{1,\alpha}$ regularity theory for a large class of singular quasilinear elliptic equations having general structure and involving distribution data in some Campanato-Morrey spaces $M_{\lambda}{}^{-1,p'}$. An optimal equivalent relation between the regularity of weak solutions and the growth of data will be proved. The Holder continuity of solutions near the boundary is also given. Our results extend and complete those of Rakotoson and Ziemer. (author). 20 refs.

27684 (IFVE-OMVT–91-131) **About structurally stable generating mechanism for invariant hyperbolic sets.** Klimenko, S.V.; Smirnova, V.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1991. [19p.] (In Russian). Order Number DE93629858. Source: OSTI; NTIS (US Sales Only); INIS.

The given paper describes a generating mechanism for strange invariant sets. A method for finding structurally stable mechanism is presented. Attractors with this mechanism are pointed out. 11 refs.; 19 figs.

27685 (IHEP-OTF–91-190) **Path integrals on warped product manifolds.** Storchak, S.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1991. [7p.] Order Number DE93629859. Source: OSTI; NTIS (US Sales Only); INIS.

By reparametrizing the paths in a path integral, set on a warped product manifold, the integral relation between the Green's functions of quantum mechanical problems is derived describing the motion on the manifold as a whole on one of the submanifolds. 5 refs.

27686 (JINR-E–2-91-544) **Toroidal solenoids in the electromagnetic field and Aharonov-Casher effect.** Afanas'ev, G.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. [27p.] Order Number DE93629861. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to J. Phys., A.

The current toroidal configurations are found which generate gauge nonequivalent vector potentials and correspond to the same quantum scattering of charged particles. The equations for the motion of toroidal moment in the magnetic field are obtained. It is proved the existence of Aharonov-Casher effect for the toroidal solenoids. The relating experiments are proposed. 19 refs.; 7 figs.

27687 (JINR-E–2-91-551) **Deformed traces and covariant quantum algebras for quantum groups $GL_{qp}(2)$ and $GL_{qp}(1/1)$.** Isaev, A.P.; Malik, R.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. [10p.] Order Number DE93629862. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Phys. Lett., B.

The q-deformed traces and orbits for the two parametric quantum groups $GL_{qp}(2)$ and $GP_{qp}(1/1)$ are defined which are subsequently used in the construction of q-orbit invariants for these groups. A general qp-(super)-oscillator commutation relations are obtained which remain invariant under the coactions of groups $GL_{qp}(2)$ and $GL_{qp}(1/1)$. The $GL_{qp}(2)$-covariant deformed algebra is deduced in terms of the bilinears of bosonic qp-oscillators which turns out to be a central extension of the Witten-type deformation of sl(2) algebra. 20 refs.

27688 (JINR-E–2-91-579) **Phase space representations and quantum probability theory.** Polubarinov, I.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. [20p.] Order Number DE93629863. Source: OSTI; NTIS (US Sales Only); INIS.

Phase space representations are constructed in quantum mechanics of spin 1. In these representations quantum mechanics and quantum probability theory acquire a similarity to the classical ones, however with essential distinctions. In some representations densities are not positive definite, in others densities are positive, but expectation values and other quantities are defined otherwise. For example, in the phase space representations the correlator of components of two spins 1 in the singlet state differs from its possible classical counterpart by extra numerical factors. This leads to the consistent quantum analogs of the Bell inequality. 24 refs.; 2 tabs.

27689 (JINR-E–2-92-171) **Paragrassmann analysis and quantum groups.** Filippov, A.T.; Isaev, A.P.; Kurdikov, A.B. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [14p.] Order Number DE93628593. Source: OSTI; NTIS (US Sales Only); INIS.

Paragrassmann algebras with one and many paragrassmann variables are considered from the algebraic point of view without using the Green anzatz. A differential operator with respect to paragrassmann variable and a covariant para-super-derivative are introduced giving a natural generalization of the Grassmann calculus to a paragrassmann one. Deep relations between paragrassmann and quantum groups with deformation parameters being root of unity are established. 20 refs.

27690 (JINR-E–2-92-272) **Impulsive moving mirror model in a Schroedinger picture with impulse effect in a Banach space.** Petrov, G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [31p.] Order Number DE93629864. Source: OSTI; NTIS (US Sales Only); INIS.

From a special class of systems has been used a Schroedinger equation with impulse effect in Minkowski space field theory with time dependent boundary conditions, i.e. those of moving mirrors. The field theoretical approach for studing the properties of the vacuum starts from an analysis of the behaviour of local field quantities in Minkowski space with uniformly moving mirrors. For the impulsive moving mirror model is the real process of interaction between the quantum field and the external mirror a subject to disturbances in its evolution acting in time very short compared with the entire duration of the process. So the stability of the solution of the Schroedinger evolution equation for the process is the stability of the vacuum of Casimir. The dependence of vacuum state energy on the distance between the uniformly relatively moving mirrors is used to calculate from the impulsive moving model the Schroedinger equation in a Banach space. 21 refs.

27691 (JINR-E–2-92-274) **Asymptotic behaviour of the solutions of Schroedinger equation with impulse effect in a Banach space.** Bainov, D.D.; Kostadinov, S.I.; Petrov, G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [7p.] Order Number DE93629865. Source: OSTI; NTIS (US Sales Only); INIS.

The present paper studies the asymptotic behaviour of the solutions of linear homogeneous differential Schroedinger equation with impulse effect in a Banach space and finds a dependence between their asymptotic behaviour and the spectrum of the linear Hamiltonian operator. 6 refs.

27692 (JINR-E–2-92-275) **Impulsive moving mirror model and the stability of Schroedinger equation with impulse effect in a Banach space.** Kostadinov, S.I.; Petrov, G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [8p.] Order Number DE93629866. Source: OSTI; NTIS (US Sales Only); INIS.

From a special class of systems has been used a Schroedinger equation with impulse effect in Minkowski space field theory with time dependent boundary conditions, i.e. those of moving mirrors. The field theoretical approach for studying the properties of the vacuum starts from an analysis of the behaviour of local field quantities in Minkowski space with uniformly moving mirrors. For the impulsive moving mirror model is the real process of interaction between the quantum field and the external mirror a subject to disturbances in its evolution acting in time very short compared with the entire duration of the process. So the stability of the solution of the Schroedinger evolution equation for the process in the stability of the vacuum of Casimir. 8 refs.

27693 (JINR-E–2-92-276) **Impulsive moving mirror model and impulsive differential equations in Banach space.** Petrov, G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [14p.] Order Number DE93629867. Source: OSTI; NTIS (US Sales Only); INIS.

The dependence of vacuum state energy on the distance between the uniformly relatively moving mirrors is used to calculate impulsive differential equations in Banach space. We formulate the problem of moving mirrors, possibly with suddenly change of velocity v in $t=t_n$, n=0, 1, 2, ..., upon which quantum fields satisfy Dirichlet boundary conditions, with the associated Casimir effect, in a functional Schroedinger picture. 10 refs.

27694 (JINR-E–5-92-392) **On paragrassmann differential calculus.** Filippov, A.T.; Isaev, A.P.; Kurdikov, A.B. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [16p.] Order Number DE93628594. Source: OSTI; NTIS (US Sales Only); INIS.

The paper significantly extends and generalizes our previous paper. Here we discuss explicit general constructions for paragrassmann calculus with one and many variables. For one variable nondegenerate differentiation algebras are identified and shown to be equivalent to the algebra of (p+1)x(p+1) complex matrices. For many variables we give a general construction of the differentiation algebras. Some particular examples are related to the multiparametric quantum deformations of the harmonic oscillators. 18 refs.

27695 (JINR-R–2-92-40) **Remarks on pair correlations of identical pions generated by extended sources.** Lyuboshits, V.L.; Podgoretskij, M.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1992. [4p.] (In Russian). Order Number DE93629869. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Yad. Fiz.

Two-particle correlations of identical pions with close momenta are discussed in the framework of the model with one-particle sources quantum-mechanically bound to definite points of space. The extent to each source is determined by the dependence of its wave function on displacement relative to corresponding 'central points'. It is shown that the refusal from the conception of hard fastened point sources leads to changing effective dimensions of the pion generation region. The considered model contains as limited situations two particular cases: hard fastened sources and free sources dispozed inside any space region. 1 ref.

27696 (JINR-R–2-92-302) **A hydrogen atom in the curved space. Expansion over free solutions on the three-dimensional sphere.** Vinitskij, S.I. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics); Pogosyan, G.S.; Sisakyan, A.N.; Strizh, T.A.; Mardoyan, L.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [18p.] (In Russian). Order Number DE93629868. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Yad. Fiz.

The Schroedinger wave functions of the hydrogen atom with the harmonic potential are considered. The harmonic potential is the solution of the Laplace equation on the 3-sphere of radius R. For large R the wave functions correspond to the Coulomb wave functions of the hydrogen atom in the flat three-dimensional space. The decompositions of the Schroedinger wave functions in free solutions are constructed and their correspondence with the known expansions of the Coulomb functions over free ones in the three-dimensional space is established. 17 refs.; 5 figs.

27697 (LA-UR–93-1824) **The fractional quantum Hall effect and the spherical shell model.** Ginocchio, J.N. Los Alamos National Lab., NM (United States). [1993]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304152–1: From spectroscopy to chaos, Rochester, NY (United States), 17 Apr 1993). Order Number DE93014553. Source: OSTI; NTIS; INIS; GPO Dep.

We review the fractional quantum Hall effect in a spherical geometry and propose an ansatz for the many electron wavefunction which may explain the fractional quantum Hall effect.

27698 (UWThPh–1992-8) **Relative concavity of ground state energies as functions of a coupling constant.** Baumgartner, B. Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 19 Mar 1992. [6p.] Order Number DE93628595. Source: OSTI; NTIS (US Sales Only); INIS.

Ground state energies of Hamiltonians in nonrelativistic quantum mechanics are analyzed with respect to their second derivative as functions of a coupling constant. In one-dimensional systems a comparison of two Hamiltonians yields relative convexity of the ground state energies as implications of a relative convexity of the potentials, by way of the relative log-concavity of the ground state wave functions. (author).

Source: OSTI; NTIS; GPO Dep.

A superfluid Stirling refrigerator has been built with a counterflow heat exchanger serving as a recuperative regenerator. It has achieved temperatures of 296 mK with a 4% ^{3}He-^{4}He mixture. Cooling power versus temperature and speed is presented for a 6.6% mixture.

27700 (UCRL-JC-113710) **EBIT Trapping Program.** Elliott, S.R. (Lawrence Livermore National Lab., CA (United States)); Beck, B.; Beiersdorfer, P.; DeWitt, D.; Knapp, D.K.; Marrs, R.E.; Schneider, D.; Church, D.; Schweikhard, L. Lawrence Livermore National Lab., CA (United States). 10 Mar 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930274-2: Workshop on traps for antimatter and radioactive nuclei, Vancouver (Canada), 25-27 Feb 1993). Order Number DE93014422. Source: OSTI; NTIS; GPO Dep.

Since its inception in 1986, the Electron Beam Ion Trap (EBIT) at LLNL has been used to produce and study highly charged ions up to U^{82+}. It has focused on the determination of electron-ion collision cross sections dielectronic recombination, electron-impact excitation, resonance excitation, and ionization as well as precise atomic structure models. The recent advance of SuperEBIT has extended the available ionization stages to bare U^{92+}. An extraction system allows us to perform experiments outside EBIT. This includes experiments in an external Penning trap under construction. Furthermore, current x-ray spectroscopic techniques will be supplemented by the future addition of a Fourier-Transform Ion Cyclotron Resonance (FT-ICR) mass spectrometry system. EBIT is geared to study not only a large variety of atomic physics but also nuclear physics phenomena, such as the bound state beta decay of fully stripped $^{163}Dy^{66+}$.

27701 (ANL/XFD/CP-79506) **A positron annihilation radiation telescope using Laue diffraction in a crystal lens.** Smither, R.K. (Argonne National Lab., IL (United States)); von Ballmoos, P. Argonne National Lab., IL (United States). Mar 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9302114-1: International Gamma-ray Astrophysics Laboratory integral workshop, Les Diablerets (Switzerland), 2-5 Feb 1993). Order Number DE93012905. Source: OSTI; NTIS; INIS; GPO Dep.

We present a new type of gamma-ray telescope featuring a Laue diffraction lens, a detector module with a 3-by-3 germanium array, and a balloon gondola stabilized to 5 arc sec pointing accuracy. The instrument's lens is designed to collect 511 keV photons on its 150 CM^2 effective area and focus them onto a small detector having only $\approx$14 CM^3 of equivalent volume for background noise. As a result, this telescope overcomes the mass-sensitivity impasse of present detectors in which the collection areas are identical to the detection area. The sensitivity of our instrument is anticipated to be 3×10^{-5} ph cm^{-2} S^{-1} at 511 key with an angular resolution of 15 arc sec and an energy resolution of 2 keV. These features will allow the resolve of a possible energetically narrow 511 keV positron annihilation line both energy-wise and spatially within a Galactic Center "microquasar" as 1E1740.7-2942 or GRS1758-258. In addition to the galactic "microquasars," other prime objectives include Cyg X-1, X-ray binaries, pulsars, and AGNS.

27702 (FNAL/Pub-93-097-A) **Redshift distortions of galaxy correlation functions.** Fry, J.N. (Fermi National Accelerator Lab., Batavia, IL (United States)); Gaztanaga, E. Fermi National Accelerator Lab., Batavia, IL (United States). 12 May 1993. 30p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC02-76CH03000. Grant NAGW-2381. Order Number DE93014007. Source: OSTI; NTIS; INIS; GPO Dep.

To examine how peculiar velocities can affect the 2-, 3-, and 4-point correlation functions, we evaluate volume-average correlations for configurations that emphasize and minimize distortions for four different volume-limited samples from each of the CfA, SSRS, and IRAS redshift catalogs. We present the results as the correlation length r_0 and power index γ of the 2-point correlation, $\bar{\xi}_2 = (r_0/r)^\gamma$, and as the hierarchical amplitudes of the 3- and 4-point functions, $S_3 = \bar{\xi}_3/\bar{\xi}_2^2$ and $S_4 = \bar{\xi}/\bar{\xi}_2^3$. We find a characteristic distortion for $\bar{\xi}_2$: The slope γ is flatter and the correlation length is larger in redshift space than in real space; that is, redshift distortions "move" correlations from small to large scales. At the largest scales, extra power in the redshift distribution is compatible with $\Omega^{4/7}/b \approx 1$; we find 0.53 ± 0.15, 1.10 ± 0.16 and 0.84 ± 0.45 for the CfA, SSRS and IRAS catalogs. Higher order correlations $\bar{\xi}_3$ and $\bar{\xi}_4$ suffer similar redshift distortions, but in such a way that, within the accuracy of our analysis, the normalized amplitudes S_3 and S_4 are insensitive to this effect. The hierarchical amplitudes S_3 and S_4 are constant as a function of scale between 1-12 h^{-1} Mpc and have similar values in all samples and catalogues, $S_3 \approx 2$ and $S_4 \approx 6$, despite the fact that $\bar{\xi}_2$, $\bar{\xi}_3$, and $\bar{\xi}_4$ differ from one sample to another by large factors. The agreement between the independent estimations of S_3 and S_4 is remarkable given the different criteria in the selection of galaxies and also the difference in the resulting range of densities, luminosities and locations between samples.

27703 (IC-93/45) **A physical model for one-dimension and time-dependent ionosphere - Pt. 1: Description of the model.** Zhang Shunrong (International Centre for Theoretical Physics, Trieste (Italy)); Radicella, S.M.; Huang, Xinyu; Su Yuanzhi. International Centre for Theoretical Physics, Trieste (Italy). Mar 1993. [9p.] Order Number DE93627958. Source: OSTI; NTIS (US Sales Only); INIS.

On the basis of continuity and momentum equations for the ionospheric F region, a time-dependent and one-dimension model for O^+, N_2^+, O_2^+, and NO^+, taking into account photoionization production, 10 recombination reactions, thermospheric wind and electromagnetic drifts, have been derived. The bottom side boundary is set to be dominated by photo-chemical reactions, meanwhile, the top side can be influenced by other processes. Electron density, especially foF_2, or flux can be given as input. The present model can be used for the investigation of the influence of different parameters on the ionospheric processes, such as neutral wind, solar radiation flux, electromagnetic forces, and others. Part 1 gives the description of the model. Numerical results and its physical discussions will be addressed in the next paper. (author). 13 refs.

27704 (IC-93/46) **A physical model for one-dimension and time-dependent ionosphere - Pt. 2: Results and discussions.** Zhang Shunrong; Radicella, S.M. International Centre for Theoretical Physics, Trieste (Italy). Mar 1993. [16p.] Order Number DE93627959. Source: OSTI; NTIS (US Sales Only); INIS.

Results of a one-dimension time-dependent ionospheric theoretical model when experimental critical frequency of the F_2 region are used as input data are given. Evidences of the validity of the mentioned model are shown; and it is indicated that the bottom side F region described by IRI90 empirical model for Wuchang (30.5^0N, 11.4^0E) are well reproduced by the theoretical model for different seasons and low solar activity, meanwhile, it is shown that IRI gives values of the electron concentration in the topside larger than the model. Also, the effect of the dynamics and the photoionization on the variation of the height of the peak is discussed. (author). 5 refs, 8 figs.

27705 (IC-93/67) **A lattice gas model on a tangled chain.** Mejdani, R. International Centre for Theoretical Physics, Trieste (Italy). Apr 1993. [25p.] Order Number DE93629888. Source: OSTI; NTIS (US Sales Only); INIS.

We have used a model of a lattice gas defined on a tangled chain to study the enzyme kinetics by a modified transfer matrix method. By using a simple iterative algorithm we have obtained different kinds of saturation curves for different configurations of the tangled chain and different types of the additional interactions. In

some special cases of configurations and interactions we have found the same equations for the saturation curves, which we have obtained before studying the lattice gas model with nearest neighbor interactions or the lattice gas model with alternate nearest neighbor interactions, using different techniques as the correlated walks' theory, the partition point technique or the transfer matrix model. This more general model and the new results could be useful for the experimental investigations. (author). 20 refs, 6 figs.

27706 (IC–93/75) **Binary pulsar PSR 1718-19 contains a stripped main-sequence turn-off star.** Zwitter, T. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [5p.] Order Number DE93631800. Source: OSTI; NTIS (US Sales Only); INIS.

Lyne et al. (1993) have recently announced the discovery of a 1-second globular cluster pulsar, 1718-19, in a 6.2-hour binary system which is embedded in a cloud of material originating from the companion star. However the incident flux of the pulsar's radiation on the companion is too low to ablate it and a main sequence companion is too small to fill its Roche lobe. Here I argue that the companion is a stripped turn-off star of 0.2-0.4 solar masses (M_{sun}) and with approx. $0.1M_{sun}$ helium core. It has approx. 1.8-times larger radius than a main sequence star of equal mass. Its position in the Hertzsprung-Russell diagram overlaps that of a $\approx 0.65M_{sun}$ main-sequence star. The evolutionary state of the companion and the highly magnetized slowly rotating neutron star place the system on the verge of the low mass X-ray binary phase. (author). 19 refs, 2 figs.

27707 (IC–93/110) **Life in the universe: Towards an understanding of its origin.** Chela-Flores, J. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [25p.] Order Number DE93631799. Source: OSTI; NTIS (US Sales Only); INIS.

A general review is presented in which we select some aspects of the origin of the cosmos, chemical evolution and, finally, the origin and the evolution of life on Earth. We emphasize the topic of molecular relics with particular attention to the relevance of the chirality of amino acids and nucleic acids. We conclude with a discussion of the primordial RNA world and with some preliminary ideas on the question of whether it is possible to detect relics of the RNA world, other than chirality itself. (author). 27 refs, 4 figs, 2 tabs.

27708 (JINR-R–14-92-321) **Toroid excitation of nuclear magnetic resonance.** Dubovik, V.M. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics); Lunegov, I.V.; Martsenyuk, M.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [16p.] (In Russian). Order Number DE93629889. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Zh. Ehksp. Teor. Fiz.

Some new approach in the NMR spectroscopy is discussed by which one can investigate a space distribution of nuclear spins and observe a 'forbidden' transition in the energy spectrum. It is based on the possibility of bringing about the transitions by vertex vector field interacting with the toroid moment of a spin system. 8 refs.; 3 figs.

27709 (LA-UR–93-1159) **Evolution of the interplanetary magnetic field.** McComas, D.J. Los Alamos National Lab., NM (United States). [1993]. 42p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9302115–2: AGU monograph/solar system plasma physics meeting on resolution of processes in space and time, Yosemite, CA (United States), Feb 1993). Order Number DE93012631. Source: OSTI; NTIS; GPO Dep.

Remote observations of magnetic field topologies in the solar corona and in situ observations of the solar wind and interplanetary magnetic field (IMF) in interplanetary space are used to examine the temporal evolution of the spatial distribution of open and closed field regions emanating from the Sun. The simple "open" configuration of inward and outward pointing sectors in the IMF is periodically disrupted by magnetically distinct coronal mass ejections (CMEs) which erupt from previously closed magnetic field regions in the corona into interplanetary space. At 1 AU, CMEs contain counterstreaming halo electrons which indicate their distinct magnetic topologies. This topology is generally thought to be: plasmoids that are completely disconnected from the Sun; magnetic "bottles," still tied to the corona at both ends; or flux ropes which are only partially disconnected. Fully disconnected plasmoids would have no long term effect on the amount of open flux; however, both in situ observations of details of the halo electron distributions and remote coronagraph observations of radial fields following CMEs indicate that CMEs generally do retain at least partial attached to the Sun. Both the magnetic-bottle and flux rope geometries require some mitigating process to close off previously open fields in order to avoid a flux catastrophe. In addition, the average amount of magnetic flux observed in interplanetary space varies over the solar cycle, also indicating that there must be ways in which new flux is opened and previously open flux is closed off. The most likely scenario for closing off open magnetic fields is for reconnection to occurs above helmet streamers, where oppositely directed field regions are juxtaposed in the corona. These events would serve to return closed field arches to the Sun and release open, U-shaped structures into the solar wind.

27710 (LA-UR–93-1508) **Advances in low energy neutral atom imaging techniques.** Scime, E.E. (Los Alamos National Lab., NM (United States)); Funsten, H.O.; McComas, D.J.; Moore, K.R.; Gruntman, M. Los Alamos National Lab., NM (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930722–2: Annual meeting of the Society of Photo-Optical Instrumentation Engineers, San Diego, CA (United States), 11-16 Jul 1993). Order Number DE93012745. Source: OSTI; NTIS; GPO Dep.

Recently proposed low energy neutral atom (LENA) imaging techniques use a collisional process to convert the low energy neutrals into ions before detection. At low energies, collisional processes limit the angular resolution and conversion efficiencies of these devices. However, if the intense ultraviolet light background can be suppressed, direct LENA detection is possible. We present results from a series of experiments designed to develop a novel filtering structure based on free-standing transmission gratings. If the grating period is sufficiently small, free standing transmission gratings can be employed to substantially polarize ultraviolet (UV) light in the wavelength range 300 Å to 1500 Å. If a second grating is placed behind the first grating with its axis of polarization oriented at a right angle to the first's, a substantial attenuation of UV radiation is achievable. ne neutrals will pass through the remaining open area of two gratings and be detected without UV background complications. We have obtained nominal 2000 Å period (1000 Å bars with 1000 Å slits) free standing, gold transmission gratings and measured their UV and atomic transmission characteristics. The geometric factor of a LENA imager based on this technology is comparable to that of other proposed LENA imagers. In addition, this of imager does not distort the neutral trajectories, allowing for high angular resolution.

27711 (LA-UR–93-1509) **Low energy neutral atom imaging techniques.** Funsten, H.O. McComas, D.J.; Scime, E.E. Los Alamos National Lab., NM (United States). 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930722–1: Annual meeting of the Society of Photo-Optical Instrumentation Engineers, San Diego, CA (United States), 11-16 Jul 1993). Order Number DE93012744. Source: OSTI; NTIS; GPO Dep.

The potential scientific return from low energy neutral atom (LENA) imaging of the magnetosphere is extraordinary. The technical challenges of LENA detection include (1) removal of LENAs from the tremendous ambient UV without losing information of their incident trajectories, (2) quantification of their trajectories, and (3) obtaining high sensitivity measurements. Two techniques that have been proposed for this purpose are based on fundamentally different atomic interaction mechanisms between LENAs and a solid: LENA transmission through an ultrathin foil and LENA reflection from a solid surface. Both of these methods provide LENA ionization (for subsequent removal from the UV by electrostatic deflection) and secondary electron emission (for start pulse generation for time-of-flight and/or coincidence). We present a comparative study of the transmission and reflection techniques

based on differences in atomic interactions with solids and surfaces. We show that transmission methods yield an order of magnitude greater secondary electron emission than reflection methods. Transmission methods are shown to be sufficient for LENA energies of approximately 1 keV to greater than 30 keV. Reflection methods using low work function surfaces could be employed for LENA ionization for energies less than several keV.

27712 (LA-UR–93-1601) **Search for continuous and single day emission from ultra-high-energy sources.** Chen, Mei-Li. The CYGNUS Collaboration. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930779–11: International cosmic-ray conference, Calgary (Canada), 19-20 Jul 1993). Order Number DE93012724. Source: OSTI; NTIS; INIS; GPO Dep.

Data from the CYGNUS experiment has been used to search the northern sky for point sources of continuous ultra-high-energy gamma radiation and to examine 51 candidate sources on a daily basis to search for episodic emission. In this paper, we make use of our most recent data to update our previously published results from these searches. The data sample is approximately twice as large as the published data set for continuous emission, and contains an additional year for the daily search. The latest results, up to the time of the conference, will be presented at the meeting.

27713 (LA-UR–93-1602) **Angular resolution studies of the CYGNUS array using the shadows of the sun and moon.** Shoup, A.L. The CYGNUS Collaboration. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930779–2: International cosmic-ray conference, Calgary (Canada), 19-20 Jul 1993). Order Number DE93012723. Source: OSTI; NTIS; GPO Dep.

Using the cosmic ray shadows of the sun and moon, we have estimated the angular resolution of the CYGNUS extensive air shower array. With the event sample now available we estimate the angular resolution of the array to be $0.70_{-0.06}{}^{+0.07}$ degrees. The resolution depends on the total number of detected shower particles. A new parameterization of the measured shower-front timing structure and the use of counters with small pulse areas lead to a ~25% improvement in the resolution. The systematic pointing error of the array is less than 0.4°.

27714 (LA-UR–93-1604) **Search for ultra-high-energy radiation from γ-ray bursts.** Schnee, R.W. The CYGNUS Collaboration. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930779–10: International cosmic-ray conference, Calgary (Canada), 19-20 Jul 1993). Order Number DE93012721. Source: OSTI; NTIS; INIS; GPO Dep.

Using data from the CYGNUS extensive air shower array, we have searched for evidence of emission of ultra-high-energy radiation coincident with γ-ray bursts observed by the BATSE instrument on the Compton Gamma-Ray Observatory. No statistically significant excess was found for any point in the sky within 4σ of BATSE's best location coordinates for any of the 56 bursts examined. Furthermore, no events were seen in the 2.2° radius circular bin surrounding γ-ray burst GRB 920720, whose location was determined accurately by the Compton/Ulysses/PVO Interplanetary Network of satellites. Flux upper limits depend greatly on the actual zenith angle of the burst. Typical fluence upper limits above 100 TeV are $\sim 10^{-6}$ erg cm^{-2}. The fluence upper limits for GRB 920720 is 2×10^{-6} erg cm^{-2}.

27715 (LA-UR–93-1606) **Search for emission of ultra high energy radiation from active galactic nuclei.** The CYGNUS Collaboration. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930779–7: International cosmic-ray conference, Calgary (Canada), 19-20 Jul 1993). Order Number DE93012719. Source: OSTI; NTIS; INIS; GPO Dep.

A search for emission of ultra-high energy gamma radiation from 13 active galactic nuclei that were detected by EGRET, using the CYGNUS extensive air-shower array, is described. The data set has been searched for continuous emission, emission on the time scale of one week, and for on the time scale of out day. No evidence for emission from any of the AGN on any of the time scales examined was found. The 90% C.L. upper limit to the continuous flux from Mrk 421 above 50 TeV is 7.5×10^{-14} cm^{-2}s^{-1}.

27716 (LA-UR–93-1607) **Search for UHE point-source emission over various time scales.** The CYGNUS Collaboration. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930779–3: International cosmic-ray conference, Calgary (Canada), 19-20 Jul 1993). Order Number DE93012718. Source: OSTI; NTIS; GPO Dep.

A method has been developed to search for pulsed and/or unpulsed ultra high energy (UHE) emission from point sources over a range of time scales. This method has been applied to data accumulated with the CYGNUS extensive air-shower array for events associated with the directions of Cyg X-3, Her X-1, the Crab nebula, and a collection of 48 secondary source candidates. An examination of time scales ranging from minutes to years has yielded results consistent with background fluctuations.

27717 (LA-UR–93-1732) **A classical instability for black strings and p-branes.** Gregory, R. (Chicago Univ., IL (United States). Enrico Fermi Inst.); Laflamme, R. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9305199–1: Gravity and relativistic astrophysics, Waterloo (Canada), 13-15 May 1993). Order Number DE93014577. Source: OSTI; NTIS; GPO Dep.

We investigate the evolution of small perturbations around black of strings and branes which are low energy solutions of string theory. For simplicity we focus attention on the zero charge case and show that there are unstable modes for a range of time frequency and wavelength in the extra 10 - D dimensions. These perturbations can be stabilized if the extra dimensions are compactified to a scale smaller than the minimum wavelength for which instability occurs and thus will not affect large astrophysical black holes in four dimensions. We comment on the implications of this result for the Cosmic Censorship Hypothesis.

27718 (LA-UR–93-1798) **Terrestrial magnetospheric imaging: Numerical modeling of low energy neutral atoms.** Moore, K.R.; Funsten, H.O.; McComas, D.J.; Scime, E.E.; Thomsen, M.F. Los Alamos National Lab., NM (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Contract F19628-90-K-0012;Grant NAGW-1655. (CONF-930722–3: Annual meeting of the Society of Photo-Optical Instrumentation Engineers, San Diego, CA (United States), 11-16 Jul 1993). Order Number DE93014561. Source: OSTI; NTIS; INIS; GPO Dep.

Imaging of the terrestrial magnetosphere can be performed by detection of low energy neutral atoms (LENAs) that are produced by charge exchange between magnetospheric plasma ions and cold neutral atoms of the Earth's geocorona. As a result of recent instrumentation advances it is now feasible to make energy-resolved measurements of LENAs from less than I key to greater than 30 key. To model expected LENA fluxes at a spacecraft, we initially used a simplistic, spherically symmetric magnetospheric plasma model.[6] We now present improved calculations of both hydrogen and oxygen line-of-sight LENA fluxes expected on orbit for various plasma regimes as predicted by the Rice University Magnetospheric Specification Model. We also estimate expected image count rates based on realistic instrument geometric factors, energy passbands, and image accumulation intervals. The results indicate that presently proposed LENA instruments are capable of imaging of storm time ring current and potentially even quiet time ring current fluxes, and that phenomena such as ion injections from the tail and subsequent drifts toward the dayside magnetopause may also be deduced.

27719 (LA-UR–93-1968) **Discussion of stress tensor nonuniqueness with application to nonuniform, particulate systems.** Aidun, J.B. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9306167–1: 14. international conference on high pressure science and technology and 1993 technical meeting of the topical group on shock compression of condensed matter, Colorado Springs, CO (United States), 28 Jun - 3 jul 1993). Order Number DE93014352. Source: OSTI; NTIS; GPO Dep.

The indeterminacy of the mechanical stress tensor has been noted in several developments of expressions for stress in a system of particles. It is generally agreed that physical quantities related to the stress tensor must be insensitive to this nonuniqueness, but there is no definitive prescription for insuring it. Kroener's tensor decomposition theorem is applied to the mechanical stress tensor σ_{ij} to show that its complete determination requires specification of its "incompatibility," $\epsilon_{ijk}\,\epsilon_{lmn}\,\partial_j\,\partial_m\,\sigma_{kn}$, in addition to its divergence, which is obtained from the momentum conservation relation. For a particulate system, stress tensor incompatibility is shown to vanish to recover the correct expression for macroscopically observable traction. This result removes concern about nonuniqueness without requiring equilibrium or arbitrarily-defined force lines.

27720 (LA-UR–93-2371) **The Solar Flare Myth in solar-terrestrial physics.** Gosling, J.T. Los Alamos National Lab., NM (United States). 1993. 15p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9302115–4: AGU monograph/solar system plasma physics meeting on resolution of processes in space and time, Yosemite, CA (United States), Feb 1993). Order Number DE93016487. Source: OSTI; NTIS; GPO Dep.

Early observations of associations between solar flares and large non- recurrent geomagnetic storms, large 'solar' energetic particle events, and transient shock wave disturbances in the solar wind led to a paradigm of cause and effect that gave flares a central position in the chain of events leading from solar activity to major transient disturbances in the near-earth space environment. However, research in the last two decades shows that this emphasis on flares is misplaced. In this paper the author outlines briefly the rationale for a different paradigm of cause and effect in solar- terrestrial physics that removes solar flares from their central position as the 'cause' of major disturbances in the near-earth space environment. Instead, this central role of 'cause' is played by events now known as coronal mass ejections, or CMEs.

27721 (LA-UR–93-2390) **Statistical mechanical theory of liquid entropy.** Wallace, D.C. Los Alamos National Lab., NM (United States). [1993]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930680–1: 1. congress of the International Society for Theoretical Chemistry and Physics, Gerona (Spain), 28 Jun - 3 jul 1993). Order Number DE93016524. Source: OSTI; NTIS; INIS; GPO Dep.

The multiparticle correlation expansion for the entropy of a classical monatomic liquid is presented. This entropy expresses the physical picture in which there is no free particle motion, but rather, each atom moves within a cage formed by its neighbors. The liquid expansion, including only pair correlations, gives an excellent account of the experimental entropy of most liquid metals, of liquid argon, and the hard sphere liquid. The pair correlation entropy is well approximated by a universal function of temperature. Higher order correlation entropy, due to n-particle irreducible correlations for $n \geq 3$, is significant in only a few liquid metals, and its occurrence suggests the presence of n-body forces. When the liquid theory is applied to the study of melting, the author discovers the important classification of normal and anomalous melting, according to whether there is not or is a significant change in the electronic structure upon melting, and he discovers the universal disordering entropy for melting of a monatomic crystal. Interesting directions for future research are: extension to include orientational correlations of molecules, theoretical calculation of the entropy of water, application to the entropy of the amorphous state, and correlational entropy of compressed argon. The author clarifies the relation among different entropy expansions in the recent literature.

27722 (LBL–33771) **Fast pulsars, compact stars, and the strange matter hypothesis.** Weber, F. (Muenchen Univ. (Germany). Inst. fuer Theoretische Physik); Glendenning, N.K. Lawrence Berkeley Lab., CA (United States). 17 Mar 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9301109–3: 2. international conference on physics and astrophysics of quark-gluon plasma, Calcutta (India), 19-23 Jan 1993). Order Number DE93015039. Source: OSTI; NTIS; INIS; GPO Dep.

Part one of this paper deals with the recent finding of the possible existence of a mixed phase of baryon matter and quark matter inside neutron stars. In part two we review the theoretically determined minimum rotational periods of neutron stars, which serve to distinguish between pulsars that can be understood as rotating neutron stars and those that can not. Likely candidates for the latter are hypothetical strange stars. Their mass-radius relationship is discussed in the last part. It is pointed out that strange stars with a nuclear crust can give rise to the observed phenomena of pulsar glitches, thus passing the only astrophysical test of the strange-matter hypothesis existing to date.

27723 (SAND–92-1967) **Ionospheric effects on a wide-bandwidth, polarimetric, space-based, synthetic-aperture radar.** Brock, B.C. Sandia National Labs., Albuquerque, NM (United States). Jan 1993. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93015084. Source: OSTI; NTIS; GPO Dep.

The earth's ionosphere consists of an ionized plasma which will interact with any electromagnetic wave propagating through it. The interaction is particularly strong at vhf and uhf frequencies but decreases for higher microwave frequencies. These interaction effects and their relationship to the operation of a wide-bandwidth, synthetic-aperture, space-based radar are examined. Emphasis is placed on the dispersion effects and the polarimetric effects. Results show that high-resolution (wide-bandwidth) and high-quality coherent polarimetrics will be very difficult to achieve below 1 GHz.

27724 (SAND–92-2240C) **Predicting the vibrations of a spinning inflated membrane.** Segalman, D.J.; Slavin, A. Sandia National Labs., Albuquerque, NM (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9309116–2: Conference on vibration and noise, Albuquerque, NM (United States), 20-22 Sep 1993). Order Number DE93010690. Source: OSTI; NTIS; GPO Dep.

The primary difficulty of computing the vibration of spinning inflated membranes arises from the low natural frequencies of such systems. When such systems are rotated near their own natural frequencies the dynamics equations must account for higher order kinematics than is necessary for more rigid structures. These complications results from the membrane loads that develop within the bodies in reaction to the accelerations of the overall body. When second order kinematics act against these membrane loads, the resulting energies become of the same order as the potential and kinetic energies of the vibrations that would be calculated by first order kinematics. These complications apply to the problem addressed here. Here we consider a spin-stabilized, inflated membrane, spinning around its minor axis. This structure is very flexible and somewhat viscoelastic, so vibrations excited by the overall motion of the structure will dissipate energy of the system, thus reducing the kinetic energy. A reduction in kinetic energy consistent with a conservation of angular momentum results in coning and, eventually, tumbling. Here we must address the excitation of vibration by the rigid-body motion and then we must address the retarding effect of the energy dissipation on the rigid-body motion.

27725 (UCRL-JC–111448) **Charge-exchange reactions and weak interaction rates for Type II supernovae.** Aufderheide, M.B. Lawrence Livermore National Lab., CA (United States). Dec 1992. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9209239–6: Workshop on nuclear physics in the universe, Oak Ridge, TN (United States), 24-26 Sep 1992). Order Number DE93015104. Source: OSTI; NTIS; GPO Dep.

The role of weak interactions, such as electron capture and beta decay on fp shell nuclei, during presupernova evolution of massive

stars is examined. The utility of charge-exchange experiments for calibrating these rates is discussed. Recent (n,p) measurements indicate that the presently used rates need to be recalculated because the location of the Gamow-Teller resonances which dominate the rates in the presupernova environment could not be accurately determined. How these measurements allow us to calibrate our shell model calculations, and thus these rates, is explained. The general character of beta decay rates in this environment is then examined. It is shown that the creation and destruction rates for electrons appear to balance just after core silicon burning. A one zone model is used to examine how the beta decays will affect the evolution of the electron number and entropy. The consequences for collapse models are briefly examined.

27726 (UCRL-JC–111689) **On inhomogeneous halo collapse and the globular cluster metallicity gradient.** Hartmann, D. (Clemson Univ., SC (United States). Dept. of Physics and Astronomy); Miller, N.; Mathews, G.; Malinie, G. Lawrence Livermore National Lab., CA (United States). Sep 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9207198–1: Santa Cruz workshop on the galaxy – globular cluster connection, Santa Cruz, CA (United States), Jul 1992). Order Number DE93013090. Source: OSTI; NTIS; GPO Dep.

Globular cluster systems hold vital information on the formation and early evolution of galaxies. In particular, any correlation between kinematics and composition might allow us to probe the most active periods of galactic chemo-dynamics (GCD). Using the detailed observations of the Galactic globular cluster system, we study GCD of the Galactic halo. Assuming that the sub-class of halo globulars traces the star formation history of the halo, we investigate the chemical evolution of a collapsing, centrally condensed proto-galaxy. The absence of a strong radial metallicity gradient is used to test inhomogeneous models. We find that violent relaxation and supernova heating wash out the metallicity gradient established during the collapse. Following cluster orbits during collapse, when the potential changes rapidly, and in a static potential thereafter, we find a very small present-day metallicity gradient, consistent with the observations.

27727 (UCRL-JC–111860) **Wind mass and energy deposition.** Castor, J.I. Lawrence Livermore National Lab., CA (United States). 21 Sep 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9206370–1: 104. annual meeting of the Astronomical Society of the Pacific, Madison, WI (United States), 20-25 Jun 1992). Order Number DE93013345. Source: OSTI; NTIS; GPO Dep.

The subject of mass return to the interstellar medium by the winds of massive stars is reviewed from the viewpoint of calculations of stellar evolution with mass loss, combined with the birth rate function for stars of different masses (IMF). The uncertainties due to the IMF and in the assumed mass loss rates are discussed. The corresponding energy deposition rates from stellar winds are also estimated.

27728 (UCRL-JC–111951) **Acousto-optical confirmation of the localized wave phenomena.** Lewis, D.K. Lawrence Livermore National Lab., CA (United States). 9 Sep 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9205354–1: 5. Spring School on acousto-optics and applications, Gdansk/Jurata (Poland), 25-29 May 1992). Order Number DE93016425. Source: OSTI; NTIS; GPO Dep.

An acousto-optical measurement method is described which was used to conduct proof of principle experiments for a novel acoustic pulse system. The pulse theory, the Localized Wave pulse, is discussed and the system explained and described. The results of the experiments confirm the Localized Wave theory.

27729 (UCRL-JC–112286) **Sub-grid scale modeling for large eddy simulations in analysis of shock-turbulence interactions.** Buckingham, A.C. (Lawrence Livermore National Lab., CA (United States)); Grun, J. Lawrence Livermore National Lab., CA (United States). Dec 1992. 16p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930785–1: 8. international conference on numerical methods in laminar and trubulent flow, Swansea (United Kingdom), 18-23 Jul 1993). Order Number DE93013425. Source: OSTI; NTIS; GPO Dep.

We continue to study the influence of dynamic shock wave interactions on turbulence. The interactions may significantly increase turbulent energy and Reynolds stress. Strong support for tensor amplification is supplied by the sharp, transiently distorted strain field in the immediate neighborhood of the shock. Beyond this there develops a gradual decay to a new, more modestly amplified state relative to the pre-shocked level. Practical interest is centered on the significantly altered, albeit shock localized, post-shock turbulent kinetic energy, eddy transport, eddy component mixing and diffusion, wall shear, and heat transfer. In the shock interaction and post-shock region, compressible two dimensional large eddy simulations (LES) are applied. A compressibility modified Smagorinsky model is adapted to represent the non-resolved sub-grid scales. Favre mass-weighted average space and time discretized compressible Navier-Stokes equations are used to represent the explicitly resolved grid scale motions. Predicted amplification levels, modal energy partition, shock translational to turbulence kinetic energy transfer, and viscoelastic response of turbulence to shock interaction are examined in comparison with available experimental evidence. A two-band dynamic eddy viscosity model representing the unresolved subgrid scale field is a possible replacement for the Smagorinsky model. Improvement is sought for predictions in the near wall region, under the influence of stochastic subgrid scale backscatter, and in the neighborhood of the shock. Wall-bounded supersonic compression corner flow experiments and hypersonic cylindrical shock wave turbulence interaction experiments are used as trial cases for test and comparison of the two classes of subgrid scale models.

27730 (UCRL-JC–113606) **The first data from the MACHO experiment.** Bennett, D.P. (Lawrence Livermore National Lab., CA (United States)); Cook, K.H.; Akerlof, C.; Perlmutter, S.; Sutherland, W.; Alcock, C.; Allsman, R.; Axelrod, T.; Park, H.S.; Freeman, K.; Peterson, B.; Quinn, P. Lawrence Livermore National Lab., CA (United States). 17 Mar 1993. 7p. Sponsored by USDOE, Washington, DC (United States); California Univ., Berkeley, CA (United States). DOE Contract W-7405-ENG-48. (CONF-921266–2: Texas/PASCO '92 international conference, Berkeley, CA (United States), 13-18 Dec 1992). Order Number DE93014423. Source: OSTI; NTIS; GPO Dep.

MAssive Compact Halo Objects such as brown dwarfs, Jupiters, and black holes are prime candidates to comprise the dark halo of our galaxy. Paczynski noted that objects (dubbed MACHOS) with masses in the range $10^{-6}\ M\odot < M \lesssim 100M\odot$ can be detected via gravitational microlensing of stars in the Magellanic Clouds with the caveat that only about one in 10^6 stars will be lensed at any given time. Our group has recently begun a search for microlensing using a refurbished 1.27 meter telescope at the Mount Stromlo Observatory in Australia. Since the summer of 1992, we have been imaging up to 10^7 stars a night in the Large Magellanic Cloud using our large format two-color 3.4×10^7 pixel CCD camera. Here I report on our first results based on an analysis of $\sim 10^6$ of these stars. Although this is not enough data to make definitive statements about the nature of the dark matter, we are able to conclude that the rate of variable star background events is not larger than the expected MACHO signal.

Brief reports are given on the work of several professors. The following areas are included: quantum chromodynamics calculations using numerical lattice gauge theory and a high-speed parallel computer; the "spin wave" description of bosonic particles moving on a lattice with same-site exclusion; a high-temperature expansion to 13th order for the O(4)-symmetric ϕ^4 model on a four-dimensional F_4 lattice; spin waves and lattice bosons; superconductivity of C_{60}; meson-meson interferometry in heavy-ion collisions; baryon number violation in the Standard Model in high-energy collisions; hard thermal loops in QCD; electromagnetic interactions of anyons; the relation between Bose-Einstein and BCS condensations; Euclidean wormholes with topology $S^1 \times S^2 \times R$; vacuum decay and symmetry breaking by radiative corrections; inflationary solutions to the cosmological horizon and flatness problems; and magnetically charged black holes.

27733 (IC–93/83) **Derivation of the Verlinde formula from Chern-Simons theory and the G/G model.** Blau, M.; Thompson, G. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [47p.] Order Number DE93628620. Source: OSTI; NTIS (US Sales Only); INIS.

We give a derivation of the Verlinde formula for the G_k WZW model from Chern-Simons theory, without taking recourse to CFT, by calculating explicitly the partition function $Z_{\Sigma xS}{}^1$ of ΣxS^1 with an arbitrary number of labelled punctures. By a suitable gauge choice, $Z_{\Sigma xS}{}^1$ is reduced to the partition function of an Abelian topological field theory on Σ (a deformation of non-Abelian BF and Yang-Mills theory) whose evaluation is straightforward. This relates the Verlinde formula to the Ray-Singer torsion of ΣxS^1. We derive the G_k/G_k model from Chern-Simons theory, proving their equivalence and give an alternative derivation of the Verlinde formula by calculating the G_k/G_k path integral via a functional version of the Weyl integral formula. From this point of view the Verlinde formula arises from the corresponding Jacobian, the Weyl determinant. Also, a novel derivation of the shift $k \rightarrow k+h$ is given, based on the index of the twisted Dolbeault complex. (author). 28 refs.

27734 (IC–93/84) **Unbounded components in parameter space of rational maps.** Makienko, P.M. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [21p.] Order Number DE93628621. Source: OSTI; NTIS (US Sales Only); INIS.

We apply the pinching construction to the study of boundaries of space of quasi-conformal deformations of rational maps. (author). 11 refs, 3 pictures.

27735 (IC–93/94) **A general solution of the BV-master equation and BRST field theories.** Dayi, O.F. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [11p.] Order Number DE93628622. Source: OSTI; NTIS (US Sales Only); INIS.

For a class of first order gauge theories it was shown that the proper solution of the BV-master equation can be obtained straightforwardly. Here we present the general condition which the gauge generators should satisfy to conclude that this construction is relevant. The general procedure is illustrated by its application to the Chern-Simons theory in any odd-dimension. Moreover, it is shown that this formalism is also applicable to BRST field theories, when one replaces the role of the exterior derivative with the BRST charge of first quantization. (author). 17 refs.

27736 (IC–93/112) **1992 Trieste lectures on topological gauge theory and Yang-Mills theory.** Thompson, G. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [74p.] Order Number DE93631804. Source: OSTI; NTIS (US Sales Only); INIS.

In these lecture notes we explain a connection between Yang-Mills theory on arbitrary Riemann surfaces and two types of topological field theory, the so called BF and cohomological theories. The quantum Yang-Mills theory is solved exactly using path integral techniques. Explicit expressions, in terms of group representation theory, are obtained for the partition function and various correlation functions. In a particular limit the Yang-Mills theory devolves to the topological models and the previously determined correlation functions give topological information about the moduli spaces of flat connections. In particular, the partition function yields the volume of the moduli space for which an explicit expression is derived. These notes are self contained, with a basic introduction to the various ideas underlying the topological field theories. This includes some relatively new work on handling problems that arise in the presence of reducible connections, which in turn, forms the bridge between the various models under consideration. These notes are identical to those made available to participants of the 1992 summer school in Trieste, except for one or two additions added circa January 1993. (author). 52 refs, 6 figs.

27737 (IC–93/116) **Finite-dimensional representations of the quantum superalgebra $U_q[gl(2/2)]$: 1. Typical representations at generic q.** Nguyen Anh Ky. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [40p.] Order Number DE93631813. Source: OSTI; NTIS (US Sales Only); INIS.

In the present paper we construct all typical finite-dimensional representations of the quantum Lie superalgebra $U_q[gl(2/2)]$ at generic deformation parameter q. As in the non-deformed case the finite-dimensional $U_q[gl(2/2)]$-module W^q obtained is irreducible and can be decomposed into finite-dimensional irreducible $U_q[l(2)+gl(2)]$submodules $V_i{}^q$. (authohor). 32 refs.

27738 (IFVE-OTF–91-181) **Four-fermion interactions: The dynamic parity violation and the Chern-Simons term.** Klimenko, K.G. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. [16p.] (IHEP-OTF–91-181.). Order Number DE93629905. Source: OSTI; NTIS (US Sales Only); INIS.

The (2+1)-dimensional theory with a four-fermion interaction of a general type has been investigated. The conditions obtained specify the possibility for the dynamic generation of the Chern-Simons (CS) term. As has been shown. A spontaneous P-parity violation does not always result in the generation of CS terms; there is vacuum in which both the chiral invariance and P-parity are violated; models with fermion vector-vector couplings are a particular case of the given theory. 10 refs.

27739 (JINR-E–2-91-580) **About symmetry of the gravitational action.** Tentyukov, M.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. [6p.] Order Number DE93629955. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Phys. Lett., A.

The Einstein equations are investigated by imbedding of the metric tensor to the affinely connected space. It is shown that if using of the Einstein equations, then, despite the action functional invariance being violated with respect to the diffeomorphism group by the background object, a new infinite-parameter invariance appears, i.e., the action invariance can be extended from the group of motions of the background object to any infinite-parameter group. 10 refs.

27740 (JINR-E–2-92-273) **Impulsive moving mirror model and the stability of linear homogeneous differential equations with impulse effect in a Banach space.** Kostadinov, S.I.; Petrov, G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [7p.] Order Number DE93629906. Source: OSTI; NTIS (US Sales Only); INIS.

From a special class of systems has been used the linear homogeneous differential equations with impulse effect in Minkowski space field theory with time dependent boundary conditions, i.e. those of moving mirrors. The field theoretical approach for studing the properties of the vacuum starts from an analysis of the behaviour of local field quantities in Minkowski space with uniformly moving mirrors. For the impulsive moving mirror model is the real process of interaction between the quantum field and the external

mirror a subject to disturbances in its evolution acting in time very short compared with the entire duration of the process. The stability of the process in the stability of the vacuum state energy. 7 refs.

27741 (JINR-E-2-92-287) **Phase structure of $(\phi^4)_3$ field theory at finite temperature.** Efimov, G.V. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics); Nedel'ko, S.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [19p.] Order Number DE93629907. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Int. J. Mod. Phys. A.

Phase structure of ϕ^4 field theory in the space-time R^3 is investigated at arbitrary coupling constant and temperature. The critical values of the coupling constant and temperature, corresponding to the phase transitions in the system, are calculated by the canonical transformation method within formalism of thermo field dynamics. The Hamiltonians describing the system in each phase are obtained straightforwardly. Comparison with the two-dimensional case shows a crucial influence of higher order renormalization on the phase structure of the model. 13 refs.; 5 figs.

27742 (JINR-R-2-91-569) **On the Michelson-Morley experiment.** Strel'tsov, V.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1991. [12p.] (In Russian). Order Number DE93629908. Source: OSTI; NTIS (US Sales Only); INIS.

The opinion about the important role of the Michelson-Morley experiment in the establishment of the principle of the constancy of the light velocity is expressed. It is noted that Fitzgerald - Lorentz contraction introduced for the explanation of its negative result contradicts to the Galilei transformations (and consequently, to ether theory). The theorem is proved that if a length of a moving rod is given by the instantaneous length, the propagation velocity of light along the rod is an inconstant quantity. It is stressed that the using of the radar length for the treatment of Michelson - Morley experiment leads to elongation formula for a longitudinal arm of the interferometer. 19 refs.

27743 (LIYaF-1770) **Generating functional for Donaldson invariants and operator algebra in topological D=4 Yang-Mills theory.** Johansen, A.A. AN SSSR, Leningrad (Russian Federation). Inst. Yadernoj Fiziki. 1992. [22p.] Order Number DE93629909. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown, that under the certain constraints the generating functional for the Donaldson invariants in the D=4 topological Yang-Mills theory can be interpreted as a partition function for the renormalizable theory. 20 refs.

27744 (RAL-93-002) **Spontaneous baryogenesis in supersymmetric models.** Abel, S.A. (Rutherford Appleton Lab., Chilton (United Kingdom)); Cottingham, W.N.; Whittingham, I.B. Rutherford Appleton Lab., Chilton (United Kingdom). Jan 1993. [15p.] Order Number DE93629956. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper we extent the results of previous work on spontaneous baryogenesis to general models involving charge-parity (CP) violation in the Higgs sector. We show how to deal with Chern-Simons terms appearing in the effective potential arising from phase changes in the vacuum expectation values of the Higgs fields. In particular, this enables us to apply this mechanism to general supersymmetric models including the minimal supersymmetric standard model, and the extended model with a gauge singlet. A comparison is made between this approach, and that in which one solves the equations of motion for Higgs winding modes. As anticipated in earlier work, the effect of the latter approach is found to be small. (Author).

27745 (BNL-48922) **PHENIX Conceptual Design Report: An experiment to be performed at the Brookhaven National Laboratory Relativistic Heavy Ion Collider.** Brookhaven National Lab., Upton, NY (United States). 29 Jan 1993. 480p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93015759. Source: OSTI; NTIS; INIS; GPO Dep.

The PHENIX Conceptual Design Report (CDR) describes the detector design of the PHENIX experiment for Day-1 operation at the Relativistic Heavy Ion Collider (RHIC). The CDR presents the physics capabilities, technical details, cost estimate, construction schedule, funding profile, management structure, and possible upgrade paths of the PHENIX experiment. The primary goals of the PHENIX experiment are to detect the quark-gluon plasma (QGP) and to measure its properties. Many of the potential signatures for the QGP are measured as a function of a well-defined common variable to see if any or all of these signatures show a simultaneous anomaly due to the formation of the QGP. In addition, basic quantum chromodynamics phenomena, collision dynamics, and thermodynamic features of the initial states of the collision are studied. To achieve these goals, the PHENIX experiment measures lepton pairs (dielectrons and dimuons) to study various properties of vector mesons, such as the mass, the width, and the degree of yield suppression due to the formation of the QGP. The effect of thermal radiation on the continuum is studied in different regions of rapidity and mass. The $e\mu$ coincidence is measured to study charm production, and aids in understanding the shape of the continuum dilepton spectrum. Photons are measured to study direct emission of single photons and to study π^0 and η production. Charged hadrons are identified to study the spectrum shape, production of antinuclei, the ϕ meson (via K^+K^- decay), jets, and two-boson correlations. The measurements are made down to small cross sections to allow the study of high p_T spectra, and J/ψ and Υ production. The PHENIX collaboration consists of over 300 scientists, engineers, and graduate students from 43 institutions in 10 countries. This large international collaboration is supported by US resources and significant foreign resources.

27746 (DOE/ER/40224-232) **Fractal interpretation of intermittency.** Hwa, R.C. Oregon Univ., Eugene, OR (United States). Dec 1991. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-85ER40224 ;FG06-91ER40637. (OITS-480;CONF-9109221-7: 21. international symposium on multiparticle dynamics, Wuhan (China), 23-27 Sep 1991). Order Number DE93010349. Source: OSTI; NTIS; INIS; GPO Dep.

Implication of intermittency in high-energy collisions is first discussed. Then follows a description of the fractal interpretation of intermittency. A basic quantity with asymptotic fractal behavior is introduced. It is then shown how the factorial moments and the G moments can be expressed in terms of it. The relationship between the intermittency indices and the fractal indices is made explicit.

27747 (DOE/ER/40388-102) **Research in theoretical nuclear physics: Progress report.** State Univ. of New York, Stony Brook, NY (United States). Dept. of Physics. Jun 1993. 131p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER40388. Order Number DE93015096. Source: OSTI; NTIS; INIS; GPO Dep.

The introductory section describes the goals, main thrusts, and interrelationships between the various activities in the program and principal achievements of the Stony Brook Nuclear Theory Group during 1992-93. Details and specific accomplishments are related in abstract form. Current research is taking place in the following areas: strong interaction physics (the physics of hadrons, QCD and the nucleus, QCD at finite temperature and high density), relativistic heavy-ion physics, nuclear structure and nuclear many-body theory, and nuclear astrophysics.

27748 (DOE/ER/40560-4C) **Particle physics and cosmology, Task C: Progress report, January 1992-April 1993.** Turner, M.S. Chicago Univ., IL (United States). May 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER40560. Order Number DE93016865. Source: OSTI; NTIS; INIS; GPO Dep.

The research has spanned many topics at the boundary of particle physics and cosmology. The major focus has been in the general areas of inflationary cosmology, cosmological phase transitions, astrophysical constraints to particle physics theories, and dark matter/structure formation as it relates to particle physics. Some attention is given to axion physics. Narrative summaries of

the research of the individual group members are given, followed by a list of publications.

27749 (DOE/FTR–93013559) **Travel to Aachen, Germany, to attend the conference on recent developments and applications of the theory of quantum chromodynamics entitled "QCD – 20 years later": Foreign trip report, June 5–18, 1992.** Bardeen, W.A. Fermi National Accelerator Lab., Batavia, IL (United States). 12 Jul 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93013559. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The conference covered all aspects of QCD, but focused on the present status and recent developments and applications of the theory. Plenary sessions were held on the following topics: e^+e^- annihilation, deep inelastic scattering, hadron–hadron collisions, QCD at large distances, high-temperature QCD, and weak interactions. Parallel sessions included those dealing with heavy quarks, lattice QCD, lepton-nucleon physics, and nuclear physics.

27750 (GANIL-P–92-16) **Multiscaling in the hadronization in high energy collisions.** Bozek, P. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)); Ploszajczak, M. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). [1992]. [20p.] Order Number DE93631816. Source: OSTI; NTIS (US Sales Only); INIS.

The multiscaling in the fluctuations of multiparticle distributions at small scales is studied. Similarly to the multiscaling effect, recently found in multifractal models, the dependence of the strength of the fluctuations on the low density cut-off in the cascade is analyzed. The effect changes the scaling behaviour and leads to stronger dependence of the scaled factorial moments on the resolution than the power law. This could be an explanation of the behaviour observed recently in the experimental 3-dimensional data on the scaled factorial moments. The multiscaling analysis allows to restore the universality in the processes with different cut-offs and could be used in the analysis of the experimental data. (author) 17 refs.; 4 figs.

27751 (GANIL-P–92-19) **The even-odd anomalous tunneling effect.** Kaminski, P. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)); Ploszajczak, M.; Drozdz, S.; Caurier, E. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). [1992]. [14p.] Order Number DE93631836. Source: OSTI; NTIS (US Sales Only); INIS.

The analysis of the interacting fermion models with SU(2) symmetry indicates the different behaviour of the splittings of opposite parity lowest energy eigenstates for even and odd number of fermions. The imaginary time-dependent mean field approach reproduces the exact results only for the even number of particles. For the odd particle numbers, an introduction of the universal logarithmic term to the action integral is needed. The even-odd effect appears in a wide class of models with SU(2) symmetry and is connected with the presence of p^4-terms in the classical large N limit. (author) 13 refs.; 3 figs.

27752 (GANIL-P–92-21) **Radiative energy loss in the quark-gluon plasma.** Bozek, P. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)). Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 7 Oct 1992. [11p.] Order Number DE93631831. Source: OSTI; NTIS (US Sales Only); INIS.

The gluon radiation from a decelerated quark in the quark-gluon plasma is calculated. The formalism treats the initial quark state classically interacting with the quantum electromagnetic field. The energy radiated in connection to the sudden appearance of the color charge is about 2 GeV. However, it is found that the energy radiation induced by the collisions with the plasma partons is small. This estimate favours the jet unquenching as a signal of the deconfined phase. (R.P.) 10 refs.; 2 figs.

27753 (IC–93/63) **Topologically stable electroweak flux tubes.** Dvali, G.; Senjanovic, G. International Centre for Theoretical Physics, Trieste (Italy). Apr 1993. [10p.] Order Number DE93628626. Source: OSTI; NTIS (US Sales Only); INIS.

We show that for a large range of parameters in a $SU(2)_L xU(1)$ electroweak theory with two Higgs doublets there may exist classically stable flux tubes of Z boson magnetic field. In a limit of an extra global U-tilde(1) symmetry, these flux-tubes become topologically stable. These results are automatically valid even if U-tilde(1) is gauged. (author). 10 refs.

27754 (IC–93/81) **On the twisted N=2 superconformal structure in 2d gravity coupled to matter.** Panda, S. (Institute for Theoretical Physics, Groningen (Netherlands)); Roy, S. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [13p.] (UG–3/93.). Order Number DE93628627. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown that the two dimensional gravity, described either in the conformal gauge (Liouville theory) or in the light cone gauge, when coupled to matter processes an infinite number of twisted N=2 superconformal symmetries. The central charges of the N=2 algebra for the two gauge choices are in general different. Further, it is argued that the physical states in the light cone gauge theory can be obtained from the Liouville theory by a field redefinition. (author). 18 refs.

27755 (IC–93/98) **2D supergravity and its connection to integrable models.** Arnaudov, L.N. (Sofia Univ., Sofia (Bulgaria). Dept. of Theoretical Physics); Prodanov, E.M.; Rashkov, R.C. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [12p.] Grant F-214/2096. Order Number DE93631817. Source: OSTI; NTIS (US Sales Only); INIS.

In the recent work two different approaches for obtaining the covariant W_2-action of 2-d quantum supergravity are considered. The first one is based on Hamiltonian reduction of flat Osp(2/1) connection in holomorphic polarization. Adding extra degrees of freedom with the help of gauging procedure the W_2-action and the superconformal identities are obtained. It is shown that the super Virasoro transformations preserve the form of the Lax connection and therefore are symmetries of the sKdV equations. In the second approach starting with Chern-Simons theory and using noncanonical polarization the zero-curvature condition entails the same results. (author). 7 refs.

(International Centre for Theoretical Physics, Trieste (Italy)); Barut, A.O.; Unal, N.; Kraus, J. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [8p.] Order Number DE93631822. Source: OSTI; NTIS (US Sales Only); INIS.

We have reevaluated analytically the vacuum polarization in Coulomb field using relativistic Coulomb wave functions by a new method. The result is finite giving the standard result in the lowest order of iteration. The formalism of selffield quantumelectrodynamics used here needs neither field quantization, nor renormalization. There are no infrared or ultraviolet divergences. (author). 18 refs.

27757 (LBL–33976) **Radiative corrections in the strongly interacting limit of the standard electroweak model.** Gaillard, M.K. Lawrence Berkeley Lab., CA (United States). 19 Apr 1993. 16p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant PHY-90-21139;Grant PHY-89-04035. (UCB-PTH–93/14;NSF-ITP–93-42;CONF-930293–3: International symposium on 30 years of neutral currents, Los Angeles, CA (United States), 3-5 Feb 1993). Order Number DE93013906. Source: OSTI; NTIS; INIS; GPO Dep.

Radiative corrections to the parameters of the standard electroweak model are considered in case that there is no light Higgs particle.

27758 (NIKHEF-H–92-17) **The three-loop QCD β-function and anomalous dimensions.** Larin, S.A. (Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H); Vermaseren, J.A.M. Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H. 1992. [5p.] Order Number DE93629973. Source: OSTI; NTIS; INIS.

The analytic calculations of the three-loop QCD β-function and anomalous dimensions within the minimal subtraction scheme in an

arbitrary covariant gauge is presented. The result for the β-function coincides with the previous calculation. (author). 13 refs.

27759 (NIKHEF-H-92-18) **The renormalization of the axial anomaly in dimensional-regularization.** Larin, S.A. (Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H). Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie H. 1992. [11p.] Order Number DE93629974. Source: OSTI; NTIS; INIS.

The prescription of the γ_5-matrix within dimensional regularization in multiloop calculations is elaborated. The three-loop anomalous dimension of the singlet axial current is calculated. (author). 24 refs., 1 fig.

27760 (RAL-92-073) **On the validity of perturbative evolution of structure functions from low Q^2.** Forshaw, J.R. Rutherford Appleton Lab., Chilton (United Kingdom). Nov 1992. [18p.] Order Number DE93629975. Source: OSTI; NTIS (US Sales Only); INIS.

The validity of using quantum chromodynamics (QCD) perturbation theory to generate dynamically the parton distribution functions of hadrons, starting from a valence-like input at low Q^2, is discussed. In particular, we consider the prescription of previous authors who evolve from Q^2 O, and those who start evolution from $Q^2 \simeq (2 \Lambda\ QCD)^2$. (Author).

27761 (RAL-93-003) **Implications for minimal supersymmetry from grand unification and the neutralino relic abundance.** Roberts, R.G. (Rutherford Appleton Lab., Chilton (United Kingdom)); Roszkowski, L. Rutherford Appleton Lab., Chilton (United Kingdom). Jan 1993. [15p.] Order Number DE93631818. Source: OSTI; NTIS (US Sales Only); INIS.

We examine various predictions of the minimal supersymmetric standard model coupled to minimal supergravity. The model is characterised by a small set of parameters at the unification scale. The supersymmetric particle spectrum at low energy and the spontaneous breaking of the standard model itself are then generated radiatively. The previously considered predictions of the model now include the neutralino relic density which in turn provides bounds on the scale parameters. We find a remarkable consistency among several different constraints which imply all supersymmetric particle masses preferably within the reach of future supercolliders (Large Hadron Collider (LHC) and Superconducting Super Collider (SSC)). The requirement that the neutralino be the dominant component of (dark) matter in the flat Universe provides a lower bound on the spectrum of supersymmetric particles beyond the reach of the European Large Electron -Positron storage rings (LEP), and most likely also the Tevatron and LEP 200. (author).

27762 (UWThPh-1992-60) **QCD condensate values from analytical structure of pion's form factor via sum rules methods.** Meshcheryakov, D.V. (High Energy Physics and Quantum Theory Division, Physics Dept., Moscow State Univ., Leninskie Gory, 119899 Moscow (Russian Federation)). Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 17 Nov 1992. [10p.] Order Number DE93628912. Source: OSTI; NTIS (US Sales Only); INIS.

A simple pion's form factor representation with physically reasonable analytical structure is applied to QCD sum rules methods. QCD condensate values are obtained through finite-energy sum rules (FESR) and Shifman-Vainstein-Zakharov sum rules (SVZ). The increase of gluon and four quark condensate values previously predicted is confirmed. (author).

27763 (WIS-PH-92-103) **Construction of realistic superstring standard-like models.** Faraggi, A.E. Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Physics. Dec 1992. [9p.] (CONF-921266-: Texas/PASCO '92 international conference, Berkeley, CA (United States), 13-18 Dec 1992). Order Number DE93629967. Source: OSTI; NTIS (US Sales Only); INIS.

I discuss the construction of realistic superstring standard-like models in the four dimensional free fermionic formulation. I discuss proton lifetime constraints on superstring models. I discuss the massless spectrum of the superstring standard-like models, the texture of fermion mass matrices in these models are argue that the realistic features of these models are due to the underlying $Z_2 * Z_2$ orbifold compactification. (author).

Source: OSTI; NTIS; INIS; GPO Dep.

Color transparency offers an interesting experimental test of our understanding of hadronic polarization effects which have been seen at high energy. Large polarization effects have been seen for exclusive high momentum transfer reactions which are incompatible with lowest order pQCD. It is proposed to filter these reactions by scattering inside a nucleus. We expect that only color transparent hadrons would survive, and that these should be products of "hard" scattering. If the polarization arrises from a non-perturbative "soft" effect, the nucleus should filter these reaction products away. We should see no polarization remaining after the reaction is filtered by a large nucleus.

27768 (BNL-48871) **Early baryon and meson spectroscopy culminating in the discovery of the Omega minus SU(3) and quarks.** Samios, N.P. Brookhaven National Lab., Upton, NY (United States). Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the early experimental and theoretical research that resulted in the discovery of the omega minus particles, quarks, and other subatomic particles.

27769 (BNL–48876) **Theoretical status of J/ψ suppression.** Gavin, S. Brookhaven National Lab., Upton, NY (United States). Mar 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9301109–2: 2. international conference on physics and astrophysics of quark-gluon plasma, Calcutta (India), 19-23 Jan 1993). Order Number DE93014290. Source: OSTI; NTIS; INIS; GPO Dep.

High energy heavy ion collisions are expected to produce hadron densities far beyond the density in nuclei, $\rho_0 = 0.16$ fm^{-3}. Remarkably, no single measurement from the AGS and SPS light ion programs with projectiles A $\leq$ 32 stands out as unambiguous evidence of these extreme densities. To separate the high density signals from the background effects that result, e.g. from scattering with primary nucleons, careful systematic studies of hadron-nucleus, hA, and nucleus-nucleus, AB, data are needed. In this talk the author surveys the ongoing systematic study of the most notorious case in point – J/ψ suppression. In principle, measurements of J/ψ suppression provide a probe of the densities obtained in AB collisions that is also sensitive to quark gluon plasma production. The latest results from SPS experiment NA38 reported by A. Romana in these proceedings show that the ratio of cross sections in the dimuon channel $B_{\mu\mu}\sigma_\psi/\sigma_{cont}$ is reduced by a factor 0.50 ± 0.05 in central S+U compared to minimum bias pU collisions at 200 AGeV. This is precisely the sort of suppression that one expects if high densities are obtained. On the other hand, a target-mass dependence suggestive of this suppression is found in hA collisions where high densities are not expected. At 200 GeV, NA38 finds that $B_{\mu\mu}\sigma_\psi/\sigma_{cont}$ falls to 0.84 ± 0.08 in pU compared to pCu. The hA suppression in this kinematic regime is likely due to a combination of nuclear effects: nucleon absorption and shadowing.

27770 (DOE/ER/10713–T4) **[Study of electroweak interactions]: Final report [February 1, 1992–January 31, 1993].** Abashian, A. Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). Dept. of Physics. [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AS05-80ER10713. This report is the final technical report for research conducted during the period February 1, 1992 to January 31, 1993. It covers three primary activities: The AMY experiment on the study of final states produced in e^+e^- collisions at $\sqrt{s} \simeq$ 60GeV, the MEGA/RHO experiment on the study of decay modes of the muon, and the R&D program on the development of resistive plate chambers for use at B factory electron colliders and possible SSC experiments.

27771 (DOE/ER/40160–9) **High energy hadron-hadron collisions: Annual progress report.** Chou, T.T. Georgia Univ., Athens, GA (United States). Dept. of Physics and Astronomy. [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-84ER40160. Order Number DE93015584. Source: OSTI; NTIS; INIS; GPO Dep.

Results of a study on high energy collisions with the geometrical model are summarized in three parts: (1) the elastic hadron-hadron collision, (2) the inelastic hadron-hadron collision, and (3) e^+e^- annihilation. For elastic scattering, a modified form for the hadronic matter form factor of the proton was proposed which is still dipole in form but contains an energy–dependent range parameter. This new expression of the opacity function fits the elastic $\bar{p}p$ scattering very well from the ISR to S$\bar{p}$pS energies. Extrapolation of this theory also yielded results $\bar{p}p$ in good agreement with the $\bar{p}p$ differential cross section measured at the Tevatron. For inelastic hadron-hadron collisions, we have made a systematic investigation of the single-particle momentum spectra in the entire S$\bar{p}$pS energy region. Results are useful for the extrapolation of angular distribution to the higher SSC energies. In e^+e^- annihilation, a detailed analysis of all available experimental multiplicity data from PETRA to LEP energies has been performed. The cluster size of emitted hadrons increases gradually with energy. Aside from high-energy collisions, the giant fullerene molecules were studied and precise algebraic eigenvalue expressions of the Hueckel problem for carbon-240 were obtained.

27772 (DOE/ER/40560–4B) **Experimental study of weak interactions by precision measurement by rare kaon decay: Progress report, October 1, 1992–April 30, 1993.** Winston, R. Chicago Univ., IL (United States). Apr 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER40560. Order Number DE93016864. Source: OSTI; NTIS; INIS; GPO Dep.

Brief status reports are given on searches for direct CP and CPT violation, and a search for further evidence of CP violation through rare kaon decays such as $K_L \rightarrow \pi^0 e^+ e^-$.

27773 (DOE/ER/40765–T1) **Standard model tests in muon decay with the MEGA detector: Progress report, July 16, 1992–May 31, 1993.** Gagliardi, C.A.; Tribble, R.E. Texas A and M Univ., College Station, TX (United States). [1993]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-93ER40765. Order Number DE93017556. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the detector system used to detect the semileptonic decay of the muon. Some of the results of this experiment are given.

27774 (DOE/FTR–93012251) **[Travel to La Plata, Argentina, to attend as external examiner the Ph.D. examination of now Dr. Antonio Bouzas and to hold discussions on the organization of the next ELAF 1993]: Foreign trip report, September 5–19, 1992.** Hojvat, C. Fermi National Accelerator Lab., Batavia, IL (United States). 4 Oct 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93012251. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Elementary Particles Phenomenology Group of the Physics Department of the Universidad de La Plata, Argentina, hosted the visit between September 9 and September 12. The purpose of the trip was to attend as external examiner the Ph.D. examination of now Dr. Antonio Bouzas and to hold discussions on the organization of the next ELAF 1993 (1993 Latin American School of Physics). The examination took place on September 11. As the thesis was based on the E735 Fermilab experiment data, an update of its analysis was presented. The visitor is the organizer of the Experimental Physics with Accelerators session of the ELAF 1993.

27775 (FNAL/C–92/345-E) **Quark and gluon jets at CDF.** Wainer, N. CDF Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-921122–66: Meeting of the Division of Particles and Fields of the American Physical Society, Batavia, IL (United States), 10-14 Nov 1992). Order Number DE93014919. Source: OSTI; NTIS; INIS; GPO Dep.

Jet shapes at $\sqrt{s}$ = 1.8 TeV have been measured by CDF at the Fermilab Tevatron Collider. The jet shape is mainly formed by parton emission before hadronization. The jet shapes may also be used to differ between quark and gluon jets. Two approaches are tried. Jet shape variables are input to a feed forward neural network trained on QCD Monte Carlos. We observe a variation of the quark content of jets as a function of jet transverse energy. The second approach consists of constructing a likelihood function, based on Monte Carlo predictions, with the Mellin moments of the momentum of charged tracks in jets. Differences are found between gluon-like jets in 2-jet events and quark-like jets in photon-jet events.

27776 (FNAL/C–93/044-E) **Direct photon production from D0.** Snow, G.R. (Michigan Univ., Ann Arbor, MI (United States). Dept. of Physics). D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-921122–62: Meeting of the Division of Particles and Fields of the American Physical Society, Batavia, IL (United States), 10-14 Nov 1992). Order Number DE93014718. Source: OSTI; NTIS; INIS; GPO Dep.

A preliminary differential cross section $d^2\sigma/d_{pT}d_\eta$ for the inclusive production of direct photons, $p\bar{p} \rightarrow \gamma + X$, at $\sqrt{s}$ = 1.8 TeV is presented. Photon candidate events included in the cross section are in the transverse momentum range 14 < pT < 90 GeV/c and the pseudorapidity range $-0.9 < \eta < 0.9$. The estimate of the

background in the photon candidate sample due to multi-photon sources is discussed. The data are compared with recent next-to-leading-order predictions.

27777 (FNAL/C–93/045/E) **A search for scalar leptoquarks in D0.** Merritt, K.W. D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-921122–52: Meeting of the Division of Particles and Fields of the American Physical Society, Batavia, IL (United States), 10-14 Nov 1992). Order Number DE93012780. Source: OSTI; NTIS; INIS; GPO Dep.

A search has been made using the data from the first run of the D0 detector at the Fermilab Tevatron for pair production of scalar leptoquarks, each decaying into electron plus quark (visible in the detector as electron plus jet). From a data sample representing 841 nb^{-1}, a limit of 74 GeV at 95% confidence level can be set on the mass of the first generation scalar leptoquark, for a particular calculation of the production cross section and a 100% branching fraction into electron plus quark.

27778 (FNAL/C–93/048/E) **Inclusive single muons at D0.** Bazizi, K.A. (California Univ., Riverside, CA (United States)). D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-921122–53: Meeting of the Division of Particles and Fields of the American Physical Society, Batavia, IL (United States), 10-14 Nov 1992). Order Number DE93012779. Source: OSTI; NTIS; INIS; GPO Dep.

We report preliminary results on b-quark production in $p\bar{p}$ collisions at $\sqrt{s}$ = 1.8 TeV from the current Run Ia of the Tevatron collider. Using an inclusive muon data sample which corresponds to an integrated luminosity of 50–70 nb^{-1} and by further requiring the muon to be accompanied by a jet we obtain an almost background free sample of muons consistent with $b\bar{b} \rightarrow \mu X$ decay. A preliminary $p_T{}^{\mu}$ spectrum and some characteristics of this decay, compared to the Monte Carlo expectations, are presented.

27779 (FNAL/C–93/050-E) **Two jet energy and rapidity distributions.** Blazey, G.C. For the DO Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1992. 5p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-921122–60: Meeting of the Division of Particles and Fields of the American Physical Society, Batavia, IL (United States), 10-14 Nov 1992). Order Number DE93014026. Source: OSTI; NTIS; INIS; GPO Dep.

The D0 detector has been recording data at the Tevatron $\bar{p}p$ Collider since May 1992. Because the D0 calorimeter is hermetic and has large acceptance it is well suited for semi-exclusive final state jet studies. We present a primary measurement of the distribution $d^3N/dE_{T1}/d\eta_1/d\eta_2$ at $\sqrt{s}$ TeV over a large range of η. The sensitivity of this cross-section to parton momentum distributions and the ability of D0 to discriminate between possible parton distributions is discussed.

27780 (FNAL/C–93/055-E) **W and Z decays to electrons in D0.** Graf, N.A. (Brookhaven National Lab., Upton, NY (United States)). D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-921122–61: Meeting of the Division of Particles and Fields of the American Physical Society, Batavia, IL (United States), 10-14 Nov 1992). Order Number DE93014719. Source: OSTI; NTIS; INIS; GPO Dep.

The D0 detector has been accumulating data at the Fermilab Tevatron at $\sqrt{s}$ = 1.8TeV for several months. In this paper we present the results of a preliminary analysis of W and Z vector boson decays into electrons based on 1.1pb^{-1} of data collected from Aug. 26. 1992 through Nov. 2, 1992. The event characteristics, as well as the number of events detected, are in good agreement with expectations.

27781 (FNAL/C–93/146-E) **Direct photon results from CDF.** Flaugher, B. CDF Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Jun 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-930363–3: 28. conference on quantum chromodynamics and high energy hadronic interactions, Les Arcs (France), 20-27 Mar 1993). Order Number DE93016349. Source: OSTI; NTIS; INIS; GPO Dep.

Results using photons measured with the CDF detector during the 1992–93 run of the Fermilab Tevatron are presented. Photon detection and background suppression are described. Measurement of the inclusive photon cross section as well as photon-jet cross sections are discussed and compared to next-to-leading order QCD predictions. The search for excited quarks using the photon-jet mass distribution is described and a limit is derived.

27782 (GANIL-T–92-02) **Multiparticle correlations and intermittency in high energy collisions.** Bozek, P. (Institute of Nuclear Physics, Cracow (Poland)). Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1992. [87p.] Order Number DE93631838. Source: OSTI; NTIS (US Sales Only); INIS.

The analysis of the intermittency signal observed in high energy experiments is presented using multiparticle distributions and correlation functions. The effect of the dimensional projection of the multiparticle distributions on one or two-dimensional subspace is discussed. The structure of the multiparticle cumulants is analyzed for the DELPHI e^+e^- annihilation data. The model of spatiotemporal intermittency is discussed in details and is shown to reproduce qualitatively the dependence of the intermittency strength on the target and projectile nuclei. A 1-dimensional (1D) cellular-automaton and a 1D forest-fire model is studied. On the example of the noncritical 1D Ising model the difficulties of the scaled factorial moment (SFM) method in extracting genuine scaling behaviour is illustrated. All these studies could serve as tools to test the sensibility of the SFM method as used in the analysis of the high energy production. (K.A.) 122 refs.; 38 figs.; 3 tabs.

27783 (IC–93/109) **Non-standard model couplings in WWV vertex.** Harun ar Rashid, A.M.; Saiful Islam, K. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [28p.] Order Number DE93631837. Source: OSTI; NTIS (US Sales Only); INIS.

Using the non-standard model vertex for WWV coupling, the helicity amplitudes, differential cross-sections and total cross-sections for the process $e^+e^- \rightarrow W^+W^-$ as functions of k_V and λ_V have been calculated, and compared with SM predictions. A similar calculation has also been done for the process $e\gamma \rightarrow WV_{\bullet}$. (author). 15 refs, 12 figs.

27784 (IC–93/111) **Asymmetry in high energy hadron-hadron collisions.** Hussein, M.T. (International Centre for Theoretical Physics, Trieste (Italy)); Hassan, N.M.; Rabea, A. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [14p.] Order Number DE93631839. Source: OSTI; NTIS (US Sales Only); INIS.

The asymmetry in hadron-hadron interactions is studied via the frame of a proposed multiperipheral model, where inclusive particle distributions are reproduced by the Monte Carlo technique. The dependence of the asymmetry upon the incident energy and the interacting particles is explained in view of the hadron-hadron quark structure. Calculations are compared with data of πp and pp at 50, 100 and 200 GeV incident hadron energy. (author). 8 refs, 5 figs, 2 tabs.

Submitted to Z. Phys., C.

A detailed description of semileptonic decays of baryons $\Lambda_b{}^0 \rightarrow \Lambda_c{}^+$ and $\Sigma_b{}^+ \rightarrow \Sigma_c{}^{++}$ in the framework of the quark confinement model, relativistic quark model based on definite assumptions about hadronization and confinement of light quarks is presented. Weak form factors, decay rates and differential distributions of semileptonic decays $\Lambda_b{}^0 \rightarrow \Lambda_c{}^+$ and $\Sigma_b{}^+ \rightarrow \Sigma_c{}^{++}$ are calculated. Also the heavy quark limit $m_Q \rightarrow \infty$ (Isgur-Wise symmetry) is examined. 28 refs.; 6 figs.; 3 tabs.

27786 (JINR-E-2-92-7) **Interference effects in inclusive charge-exchange p+p→n+X and n+p→p+X reactions at intermediate energies.** Gareev, F.A.; Ratis, Yu.L.; Korovin, P.P.; Strokovskij, E.A.; Vaagen, J.S. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [18p.] Order Number DE93629991. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Phys. Lett.

The formalism of Feynman diagrams to describe charge-exchange reactions p+p→n+X and n+p→p+X on a free proton target taking into account spectator and decay modes in the π+ρ+g'-model have used. It is shown that the interference between these modes depends on the set of vertex function parameters used. It is also shown that the constructive interference of the Δ^+ and Δ^0-isobars is important. 22 refs.; 10 figs.

Submitted to Nucl. Phys.

Based on the conserved-vector-current (CVC) hypothesis and a four-ρ-resonance unitary and analytic vector dominance model of the pion electromagnetic form factor, the $\sigma_{tot}(E_\nu^{lab})$ and $d\sigma/dE_\pi^{lab}$ of the weak ν-bar$_e$e$^-\to\pi^-\pi^0$ process are predicted theoretically for the first time. Their experimental approval could verify the CVC hypothesis for all energies above the two-pion threshold. Since, unlike the electromagnetic $e^+e^-\to\pi^+\pi^-$ process, there is no isoscalar vector-meson contribution to the weak ν-bar$_e$e$^-\to\pi^-\pi^0$ reaction, accurate measurements of the $\sigma_{tot}(E_\nu^{lab})$ that moreover is strengthened with energy E_ν^{lab} linearly could solve the problem of the mass specification of the first excited state of the ρ (770) meson. An equality σ_{tot} (ν-bar$_e$e$^-\to\pi^-\pi^0$)=σ_{tot} ($e^+e^-\to\pi^-\pi^0$) is predicted for $\sqrt{s}\simeq 70$ GeV. 4 refs.; 5 figs.

27788 (LA–12559-T) **Inclusive measurements of pion double charge exchange and inelastic scattering on ^{3}He.** Yuly, M.E. Los Alamos National Lab., NM (United States). Jun 1993. 328p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93014377. Source: OSTI; NTIS; INIS; GPO Dep.

Thesis submitted to Massachusetts Inst. of Tech., Cambridge, MA.

A measurement was made at the Los Alamos Meson Physics Facility (LAMPF) of the doubly differential cross sections for three inclusive pion reactions on ^{3}He: π^- double charge exchange (DCX), and π^+ and π^- inelastic scattering. The cross sections for DCX were measured at incident energies of 120, 180, 210, and 240 MeV, and at angles of 25, 50, 80, 105, and 130°, while inelastic scattering cross sections were measured at 120, 180, and 240 MeV and scattering angles of 50, 80, 105, and 130°. The final pion energy spectrum was measured from 10 MeV up to the kinematic limit. In the Δ resonance region, where the isospin T = 3/2 channel dominates, the inelastic π^- scattering should be almost entirely from the lone neutron in ^{3}He. The π^+ inelastic scattering was expected to have significant contributions from both single and double scattering, because the T = 3/2 channel favors π^+-p scattering from the two protons in ^{3}He. The ^{3}He DCX spectra are similar to those observed for DCX in ^{4}He. The forward angle double peaks can be understood as a consequence of sequential single charge exchange (SSCX). Calculations using the SSCX model are in rough agreement with the measured shape of the ^{3}He DCX spectra. The doubly differential cross sections measured for the inelastic scattering reactions exhibit a strong enhancement near the kinematics for free π^--p scattering. The ratios of π^+ to π^- scattering cross sections may indicate multiple scattering, as well as the agreement of the low outgoing energy part of the π^+ inelastic scattering spectra with the corresponding properly scaled DCX spectra. A distorted-wave impulse-approximation (DWIA) calculation of the quasielastic cross sections has been performed and a comparison made with the measured inelastic cross sections.

27789 (LAL–92-09) **The perturbative QCD prediction to R_τ revisited.** Le Diberder, F. (Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire); Pich, A. Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire. Feb 1992. [17p.] (CERN-TH–6421/92.). Order Number DE93631844. Source: OSTI; NTIS (US Sales Only); INIS.

An improved QCD perturbative expansion of the total hadronic width of the tau lepton is presented. Within the framework of this revisited QCD prediction, the sensitivity of the extracted $\alpha_s(m_\tau^2)$ value to the unknown higher-order perturbative corrections and, more generally, the systematic error attached to the renormalization scheme ambiguity are reanalyzed. A more convergent perturbative expansion is proposed which is associated with a smaller renormalization-scheme dependence and better-defined higher-order uncertainties. (R.P.) 17 refs.; 4 figs.; 1 tab.

27790 (LA-UR–93-1292) **Rare muon processes.** Cooper, M.D. The MEGA Collaboration. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930389–4: Future directions in particle and nuclear physics at multi-GeV hadron beam facilities, Upton, NY (United States), 4-6 Mar 1993). Order Number DE93012646. Source: OSTI; NTIS; INIS; GPO Dep.

The status of rare muon processes as tests of the standard model is reviewed with the emphasis on results that are expected from experiments in the near future.

27791 (LA-UR–93-1965) **Resonances in the ΣNN system.** Gibson, B.F. (Los Alamos National Lab., NM (United States)); Afnan, I.R. Brookhaven National Lab., Upton, NY (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930389–14: Future directions in particle and nuclear physics at multi-GeV hadron beam facilities, Upton, NY (United States), 4-6 Mar 1993). Order Number DE93014353. Source: OSTI; NTIS; INIS; GPO Dep.

We first review certain unique aspects of few-body Λ- hypernuclei and then explore the physics of Σ threshold in few-body elastic scattering and reactions. In particular, we discuss a predicted enhancement in the Ad cross section near the ΣNN threshold in terms of poles in the T=0YNN amplitude. A brief discussion of anticipated poles in the T=1 amplitudes is also given.

27792 (LA-UR–93-1969) **Beauty and charm production from Fermilab experiment 789.** Jansen, D.M. (Los Alamos National Lab., NM (United States)); Boissevain, J.; Carey, T.A.; Jeppesen, R.G.; Kapustinsky, J.S.; Lane, D.W.; Leitch, M.J.; Lillberg, J.W.; McGaughey, P.L.; Moss, J.M.; Peng, J.C.; Brown, G.; Isenhower, L.D.; Keyser, J.; Sadler,.Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930363–1: 28. conference on quantum chromodynamics and high energy hadronic interactions, Les Arcs (France), 20-27 Mar 1993). Order Number DE93014351. Source: OSTI; NTIS; INIS; GPO Dep.

Experiment 789 is a fixed-target experiment at Fermilab designed to study low-multiplicity decays of charm and beauty. During the 1991 run. E789 collected $\approx 10^9$ events using an 800 GeV proton beam incident upon gold and beryllium targets. Analyses of these data include searches for b → J/ψ+X decays and Λ- dependence measurements of neutral D meson production. Preliminary results from the 1991 run are presented in this paper.

27793 (LA-UR–93-1970) **Present status of SAGE.** Bowles, T.J. For the SAGE Collaboration. Los Alamos National Lab., NM (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930187–5: 13. Moriond workshop on perspectives in neutrinos, atomic physics, and gravitation, Villars-sur-Ollon (Switzerland), 30 Jan - 6 feb 1993). Order Number DE93014350. Source: OSTI; NTIS; GPO Dep.

A radiochemical ^{71}Ga-^{71}Ge experiment to determine the primary flux of neutrinos from the Sun began measurements of the solar neutrino flux at the Baksan Neutrino Observatory in 1990. The number of ^{71}Ge atoms extracted from 30 tons of gallium in 1990 and from 57 tons of gallium in 1991 was measured in twelve runs during the period of January 1990 to December 1991. The combined 1990 and 1991 data sets give a value of 58+17/−24 (stat) ±

14 (syst) SNU. This is to be compared with 132 SNU predicted by the Standard Solar Model.

27794 (LA-UR-93-2021) **Past, present and future (π,η) experiments.** Peng, J.C. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930389-21: Future directions in particle and nuclear physics at multi-GeV hadron beam facilities, Upton, NY (United States), 4-6 Mar 1993). Order Number DE93016631. Source: OSTI; NTIS; INIS; GPO Dep.

Following a discussion of some physics issues in η experiments, the current status of the (π,η) experiments is reviewed. Future prospects for η experiments are also presented.

27795 (LBL-33952) **Status of α_s measurements.** Hinchliffe, I. Lawrence Berkeley Lab., CA (United States). 5 May 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9303171-2: 28. Recontres de Moriond conference on electroweak interaction and unified theories, Les Arcs (France), 13-20 Mar 1993). Order Number DE93015179. Source: OSTI; NTIS; INIS; GPO Dep.

I review the current determinations of α_s. Attention is given to the theoretical uncertainties inherent in most determinations. all current determinations are consistent with an average of $\alpha_s(M_Z) = 0.119 \pm 0.005$. Prospects for reduction of the errors in the future are discussed.

27796 (LBL-34077) **Electroweak physics from D0.** Roe, N.A. D0 Collaboration. Lawrence Berkeley Lab., CA (United States). May 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9303172-1: 1993 Recontres de Physique de La Vallee D'Aoste, LaThuile (Italy), 8-13 Mar 1993). Order Number DE93015041. Source: OSTI; NTIS; INIS; GPO Dep.

The D0 detector was recently commissioned at the Tevatron $p\bar{p}$ collider and is presently taking data. Preliminary results from D0 are presented on properties of the W and Z electroweak gauge bosons, using final states containing electrons and muons.

27797 (PCCF-T-92-09) **Experimental study of charm at LEP by the D* meson channel with ALEPH detector.** Bencheikh, A.M. Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. Sep 1992. [170p.] (In French). Order Number DE93631842. Source: OSTI; NTIS (US Sales Only); INIS.

This research deals with the analysis of some 500 000 neutral Z bosons recorded with the ALEPH detector between 1989 and 1991. The physical subject concerns the study of charm at LEP and more precisely the production of charmed mesons, charged and excited: D^*. Charged mesons are reconstructed in the channel with two pions and one kaon in the final state via the decay of neutral charmed one. We have measured simultaneously the ratio of D^* meson production, the relative contribution of charm and beauty in D^* meson production and the average fraction of the beam energy carried away by the D^* meson at the time of its fragmentation. The charge asymmetry of charm has been also measured thanks to the high purity in charm events obtained by the D^* tagging and finally allows us to infer the value of the electroweak mixing angle.

27798 (RAL-92-026) **Scalar mesons in ϕ radiative decay: Their implications for spectroscopy and for studies of CP-violation at ϕ factories.** Close, F.E. (Rutherford Appleton Lab., Chilton (United Kingdom)); Isgur, N.; Kumano, S. Rutherford Appleton Lab., Chilton (United Kingdom). Jun 1992. [27p.] (CEBAF-TH-92-13;IU/NTC-92-16.). Order Number DE93631843. Source: OSTI; NTIS (US Sales Only); INIS.

Existing predictions for the branching ratio for $\phi \rightarrow KK\ \gamma$ via $\phi \rightarrow S\ \gamma$ (where S denotes one of the scalar mesons $f_o(975)$ and $a_o(980)$) vary by several orders of magnitude. Given the importance of these processes for both hadron spectroscopy and charge-parity-violation studies at ϕ factories (where $\phi \rightarrow K^oK\text{-bar}^o\gamma$ poses a possible background problem), this state of affairs is very undesirable. We show that the variety of predictions is due in part to errors and in part to differences in modelling. The latter variation leads us to argue that the radiative decays of these scalar states are interesting in their own right and may offer unique insights into the nature of the scalar mesons. As a byproduct we find that the branching ratio for $\phi \rightarrow K^oK\text{-bar}^o\ \gamma$ is approx. $< 0(10^{-7})$ and will pose no significant background to proposed studies of CP-violation. (Author).

27799 (SLAC-PUB-5832) **An historical review of lepton proton scattering.** Taylor, R. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jun 1992. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-910836-6: 19. Stanford Linear Accelerator Center (SLAC) summer institute on particle physics, Stanford, CA (United States), 5-16 Aug 1991). Order Number DE93015246. Source: OSTI; NTIS; INIS; GPO Dep.

In this talk I will try to review some of the early experiments in the field of electron-proton scattering, concentrating mostly on the inelastic scattering experiments at SLAC. Ordinarily, those experiments would be covered in the first five or ten minutes of the talks by Professor Scuilli and Drell, but this is a special year, and I will feel free to reminisce about the early days in a somewhat personal way.

27800 (UWThPh-1992-61) **General solution of Chew-Low equations for πN scattering in terms of θ-functions.** Meshcheryakov, D.V. (High Energy Physics and Quantum Theory Division, Physics Dept., Moscow State Univ., Leninskie Gory, 119899 Moscow (Russian Federation)). Vienna Univ. (Austria). Inst. fuer Theoretische Physik. 17 Nov 1992. [6p.] Order Number DE93628913. Source: OSTI; NTIS (US Sales Only); INIS.

General solution of Chew-Low equations for πN scattering in terms of θ-functions is obtained. Previously known solutions can be derived from the new one by limiting procedures. (author).

27801 (BNL-48865) **Summary of the η-meson sessions.** Chrien, R.E. Brookhaven National Lab., Upton, NY (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930389-15: Future directions in particle and nuclear physics at multi-GeV hadron beam facilities, Upton, NY (United States), 4-6 Mar 1993). Order Number DE93014320. Source: OSTI; NTIS; INIS; GPO Dep.

This summary describes the contents of the nineteen talks related to research on the η meson and presented at the Workshop of Future Directions. The subjects of this area include threshold η production, η-nuclear spectroscopy, baryon spectroscopy, η decays, facilities, and instrumentation.

27802 (DOE/ER/40427-02-N93) **Measuring strangeness in the nucleon.** Henley, E.M. Washington Univ., Seattle, WA (United States). Dept. of Physics. [1992]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-88ER40427. (CONF-9211243-1: 35. Congresso Nacional de Fisica, Puebla (Mexico), Nov 1992). Order Number DE93014861. Source: OSTI; NTIS; INIS; GPO Dep.

Evidence for strangeness matrix-elements in the proton are reviewed, and other measurements for specific strangeness matrix elements are presented.

27803 (JINR-E-2-92-3) **Scaling effects and properties of delta-isobar resonances.** Ratis, Yu.L.; Gareev, F.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [8p.] Order Number DE93630004. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Phys. Lett.

A simple model is suggested for the description of the delta-isobar gross properties based on the two-fold shape resonances. 7 refs.; 2 figs.; 1 tab.

27804 (JINR-E-2-92-88) **Method for determination of W-boson total width.** Ivkin, A.V. (AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Fiziki Vysokikh Ehnergij); Nazirov, M.T.; Kuraev, E.A. Joint Inst. for Nuclear Research, Dubna (Russian

Federation). Lab. of Theoretical Physics. 1992. [4p.] Order Number DE93630011. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Mod. Phys. Lett. A.

A new way to measure the total width of a narrow resonance by total cross-section is proposed. The technique is exemplified in detail in the reactions $e^+e^- \rightarrow W^+W^-$, $\gamma e \rightarrow W\nu$. 5 refs.; 1 fig.; 1 tab.

27805 (LAL–92-59) **Higgs boson searches at LEP 1.** Grivaz, J.F. Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire. Oct 1992. [20p.] (CONF-9209363–: Workshop on 'Ten Years of Susy Confronting Experiment', Geneva (Switzerland), 7-9 Sep 1992). Order Number DE93631851. Source: OSTI; NTIS (US Sales Only); INIS.

The searches performed by the four LEP experiments for the minimal standard model Higgs boson and for the charged and neutral Higgs bosons expected in two-doublet models, in particular within the supersymmetric framework, are reviewed. The mass of the standard model Higgs boson exceeds 60 GeV/c^2 at more than 95% CL. Charged Higgs bosons with masses lower than 43 GeV/c^2 are excluded. The masses of the CP-even h and of the CP-odd A Higgs bosons of the MSSM are constrained to be larger than 43 GeV/c^2 and 21 GeV/^{2}, respectively. (author) 42 refs.; 6 figs.; 8 tabs.

27806 (LA-UR–93-1348) **On the 17-keV neutrino.** Hime, A. Los Alamos National Lab., NM (United States). Apr 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9303160–1: Workshop on neutrino telescopes, Venice (Italy), 2-4 Mar 1993). Order Number DE93012638. Source: OSTI; NTIS; INIS; GPO Dep.

A brief review on the status of the 17-keV neutrino is presented. Several different experiments found spectral distortions which were consistently interpreted as evidence for a heavy neutrino admixture in β decay. Recent experiments, however, rule out the existence of a 17-keV neutrino as well as escaping criticisms of earlier null results. Moreover, the majority of positive results have been reinterpreted in terms of instrumental effects, despite the need for a different explanation in each case. Anomalies persist in the low energy region of the tritium spectrum which deserve further investigation.

27807 (PCCF-T–92-07) **Determination of nucleon structure functions on the assumption of diquark presence.** Tavernier, P. Savoie Univ., 73 - Chambery (France); Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. Jul 1992. [108p.] (In French). Order Number DE93631847. Source: OSTI; NTIS (US Sales Only); INIS.

In this thesis, we asked for the presence in the nucleons of either scalar or axial vector diquarks. After the introduction of the basis notions on diquarks and their interest in the understanding of various physical problems, we present in the first chapter the theoretical frame in SU(6) symmetry. Chapter 2 and 3 are respectively devoted to the Stockholm and Torino models. We point out to get a very nice fit of the experimental data with models we had to put in a small Q^2 dependence in the various quarks distribution functions previously determined. In chapter 4, we used our distribution functions and compared our predictions with experimental results: the ratio of the neutron electromagnetic structure function to that of the proton, the ratio of the longitudinal component to the transverse one for the lepton-nucleon scattering cross-section, so the dileptons production in Drell-Yan process. The conclusion of that study is that the presence of diquarks does not lead, at the moment, to any obvious contradiction with the experimental data; diquarks as constituents are a viable idea, which in certain kinematical regions could be of crucial importance.

27808 (RAL–92-070) **New data on the KK-bar threshold region and the nature of the $f_0(S^*)$.** Morgan, D. (Rutherford Appleton Lab., Chilton (United Kingdom)); Pennington, M.R. Rutherford Appleton Lab., Chilton (United Kingdom). Dec 1992. [53p.] (DTP–92/55.). Order Number DE93631849. Source: OSTI; NTIS (US Sales Only); INIS.

We combine new data on $f_0(S^*)$ production in J/ψ and D_s decays with earlier information on central production and elastic $\pi\pi$, KK-bar processes to make a fresh examination of the $f_0(S^*)$ resonance. The key feature of our amplitude analysis is its strict enforcement of unitarity. This allows the good energy resolution of the new $J/\psi \rightarrow \phi\pi\pi$(KK-bar) data to play its full role in delineating the $f_0(S^*)$ resonance structure that experiment demands. This enables us to distinguish alternative resonance mechanisms that have been proposed: we conclude that $f_0(S^*)$ is most probably not a KK-bar molecule, nor an amalgam of two resonances, but a conventional Breit-Wigner-like structure. In this preferred description, the $f_0(S^*)$ has rather a narrow width ($\Gamma_0 \approx 52$ MeV) and comparable couplings to $\pi\pi$ and KKbar. Possible spectroscopic interpretations are considered. (Author).

27811 (BNL–48879) **Strange particle nuclear physics: Workshop summary.** Dover, C.B. Brookhaven National Lab., Upton, NY (United States). Mar 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930389–17: Future directions in particle and nuclear physics at multi-GeV hadron beam facilities, Upton, NY (United States), 4-6 Mar 1993). Order Number DE93014323. Source: OSTI; NTIS; INIS; GPO Dep.

Several sessions of the Working Group on Hadronic and Nuclear Spectroscopy dealt with different aspects of strange particle nuclear physics, including hypernuclear spectroscopy, strange dibaryons, and K^+ interactions with nuclei. Recent developments in this area are summarized here, and open questions are identified. Some prospects for optimum use of existing facilities, as well as the desired characteristics of future ones, are discussed.

27812 (BNL–48886) **Doubly strange hypernuclei.** May, M. Brookhaven National Lab., Upton, NY (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930389–16: Future directions in particle and nuclear physics at multi-GeV hadron beam facilities, Upton, NY (United States), 4-6 Mar 1993). Order Number DE93014324. Source: OSTI; NTIS; INIS; GPO Dep.

Doubly strange hypernuclei are fundamental for understanding proposed new particles and states of matter containing two or more units of strangeness. Experiments are required to confirm the existence of $\Lambda\Lambda$ hypernuclei, measure their lifetimes, binding energies, and decay modes, and search for possible anomalies. An experiment to observe and study them is planned utilizing the higher intensity beams now available at the AGS. Detailed study will require further improvements in intensity and facilities. Facility requirements for future experiments are discussed.

Oak Ridge National Lab., TN (United States); Georgia Inst. of Tech., Atlanta, GA (United States); UNISOR, Oak Ridge, TN (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER40330 ;AC05-76OR00033 ;AC05-84OR21400. From 6. international conference on nuclei far from stability and 9th international conference on atomic masses and fundamental constants; Bernkastel-Kues (Germany); 19-24 Jul 1992. Order Number DE93015337. Source: OSTI; NTIS; INIS; GPO Dep.

Several experiments were performed at the UNISOR isotope separator facility at HHIRF at the Oak Ridge National Laboratory on the β^+/EC decay of neutron-deficient rare earth isotopes. Data for the three decay chains $^{137}Eu \rightarrow {}^{137}Sm \rightarrow {}^{137}Pm \rightarrow {}^{137}Nd$, $^{135}Sm \rightarrow {}^{135}Pm \rightarrow {}^{135}Nd$ and $^{133}Sm \rightarrow {}^{133}Pm \rightarrow {}^{133}Nd$ were obtained consisting of multiscaled spectra of γ rays, x rays, and conversion electrons, as well as $\gamma\gamma t$, $X\gamma t$, $e\gamma t$ and eXt coincidences. Gamma rays associated with the decay of ^{133}Sm and ^{133}Pm were observed for the first time. The decay of a new low-spin (1/2,3/2) isomeric state, with a half life around 70 sec was seen in ^{133}Nd. Systematics and particle-rotor calculations are discussed.

27814 (CONF-9211199–8) **Low-spin identical bands in rare earth nuclei.** Baktash, C.; Winchell, D.F.; Garrett, J.D.; Smith, A. Oak Ridge National Lab., TN (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Symposium on nuclear physics of our times; Sanibel Island, FL (United States); 17-21 Nov 1992. Order Number DE93015484. Source: OSTI; NTIS; INIS; GPO Dep.

A comprehensive study of odd-A rotational bands in normally deformed rare earth nuclei indicates that a large number of seniority-one configurations (21% for odd-Z nuclei) at low spin have moments of inertia nearly identical to that of the seniority-zero configuration of the neighboring even-even nucleus with one less nucleon. It is difficult to reconcile these results with conventional models of nuclear pair correlation, which predict variations of about 15% in the moments of inertia of configurations differing by one unit in seniority.

27815 (CONF-921274–1) **Exotic nuclei.** Sheikh, J.A. (Joint Inst. for Heavy Ion Research, Oak Ridge, TN (United States)). Joint Inst. for Heavy Ion Research, Oak Ridge, TN (United States); Tata Inst. of Fundamental Research, Bombay (India). [1992]. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Symposium on nuclear physics organized by Department of Atomic Energy (DAE); Bombay (India); 21-24 Dec 1992. Order Number DE93012763. Source: OSTI; NTIS; INIS; GPO Dep.

The nuclei far from the β-stability valley which are referred to as exotic nuclei have attracted considerable interest in recent years. Undoubtedly the study of the exotic nuclei is destined to be one of the frontier fields in nuclear structure physics. The recent experiments with radioactive beams have opened up this new era in nuclear spectroscopy. The lighter exotic nuclei are observed to show quite interesting features. For example, a halo structure has been attributed to ^{11}Li in order to explain the observed large matter radius. Also, it is seen that $^{31--33}Na$ show deformed characteristics rather than the spherical shape expected from the shell closure at N = 20. This points towards a need for a new investigation of the shell structure as one moves away from the β – stability valley. With the aforementioned interesting features observed for the lighter nuclei, clearly one question of great interest is whether similar effects can be seen in heavy nuclei. New calculations using the relativistic mean field approach have been performed for a range of nuclei over a wide range of isotopes up to those with a large excess of neutrons. In the present talk, some interesting new results obtained from these calculations win be discussed.

27816 (CONF-9303189–1) **The role of nuclear shapes in nuclear structure (from the perspective of the Daresbury Tandem).** Nazarewicz, W. Joint Inst. for Heavy Ion Research, Oak Ridge, TN (United States); Tennessee Univ., Knoxville, TN (United States). Dept. of Physics. [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;FG05-87ER40361 ;FG05-93ER40770. From Requiem for an accelerator conference; Daresbury (United Kingdom); 13-14 Mar 1993. Order Number DE93015805. Source: OSTI; NTIS; INIS; GPO Dep.

In specific regions of the nuclear periodic chart, large multipole moments are observed and the low-lying excitations have a rotational character. These features are understood if the nuclei in question are assumed to have a stable deformation, i.e., a non-spherical distribution of the nuclear matter. In other (transitional) regions the quasi-rotational bands are present; they are strongly coupled to low-lying vibrational modes. Those nuclei are best understood in terms of small static deformations but large dynamic fluctuations around local equilibria. As a matter of fact, the vast majority of nuclei are deformed; even in those which are spherical or almost spherical, the dynamical couplings to shape vibrations are crucial. The issue of nuclear deformation is many-faceted. If the nuclear shape (nuclear mean field) is deformed, characteristic excitation modes are present, such as rotations and vibrations built upon the non-spherical equilibrium. Through the particle-core coupling, nuclear deformations can dramatically influence the single-particle properties of nucleons moving in the average nuclear potential. Many experimental investigations using the Daresbury Tandem were related in one way or another to the physics of nuclear shapes. Fundamental discoveries from Daresbury include the observation of superdeformed structures in rapidly rotating nuclei, the observation of identical ("twinned") rotational bands, various studies of structural changes induced by very fast rotation (band-crossings, band-terminations), the observation of the oblate-deformed "dipole" bands, studies of reflection-asymmetric shapes, studies of (quasimolecular) cluster configurations in light nuclei, and many, many others. The author reviews the forefront research at Daresbury from the global perspective; the common denominator being the nuclear shape deformation.

27817 (DOE/FTR–93011417) **Travel to Belgium to attend a meeting of the IAEA International Nuclear Structure Data Network and to inspect facilities for the measurement of neutron cross sections in Belgium and Germany: Foreign trip report, November 8–16, 1992.** Meyer, R.A. USDOE Office of Energy Research, Washington, DC (United States). Office of High Energy and Nuclear Physics. 2 Dec 1992. 5p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93011417. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Proceedings and action items from the meeting of the IAEA International Nuclear Structure Data Network are summarized. Visits to the CENMol accelerator facility, that performs neutron cross section measurements, and to the PTB-Braunschweig accelerator facility that is used for neutron calibration and cross section measurements, are briefly described.

27818 (GANIL-P–92-24) **Simulating the Langevin force by simple noise in nuclear one-body dynamics.** Chomaz, Ph. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)); Colonna, M.; Burgio, G.F.; Toro, M. Di; Randrup, J. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1992. [13p.] Order Number DE93631859. Source: OSTI; NTIS (US Sales Only); INIS.

For the purpose of addressing catastrophic phenomena in nuclear dynamics, the possibility of simulating the stochastic part of the collision integral is explored in the Boltzmann-Langevin model by the numerical noise associated with the finite number of test particles in the ordinary BUU treatment. Considering idealized two-dimensional matter, for which it is practical to simulate the Boltzmann-Langevin equation directly, it is demonstrated that the number of test-particles per nucleon can be adjusted so that the corresponding BUU calculation yields a good reproduction of the

spontaneous clusterization occurring inside the spinodal region. This approximate method may therefore provide a relatively easy way to introduce meaningful fluctuations in simulations of unstable nuclear dynamics. (author) 18 refs.; 3 figs.

27819 (GANIL-P–93-02) **Pre-equilibrium effects on properties of hot giant dipole resonances.** Chomaz, Ph. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)); Di Toro, M.; Smerzi, A. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1993. [24p.] Order Number DE93631855. Source: OSTI; NTIS (US Sales Only); INIS.

In this article we analyse how the presence of a pre-equilibrium dipole strength can affect the properties of the Giant Dipole Resonance (GDR) built on hot nuclei. We show that a little amount of GDR phonons still excited when the compound nucleus is formed will substantially modify the γ decay from the giant resonance region. Also on the basis of microscopic calculations of the reaction dynamics we propose to study the effect of the N over Z ratio in the entrance channel. This analysis could bring to independent informations on the problem of the GDR disappearing at high excitation energy.

27820 (INS-T–518) **Report of an INS two-day meeting on roles of Pauli principle in few-body problems: Discussions with Prof. V.I. Kukulin.** Kamimura, M. (ed.) (Kyushu Univ., Fukuoka (Japan). Dept. of Physics). Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Feb 1993. 74p. (CONF-9110505–: INS two-day meeting on roles of Pauli principle in few-body problems, Tanashi (Japan), 30-31 Oct 1991). Order Number DE93508341. Source: OSTI; NTIS; INIS.

This small INS meeting on 'Roles of Pauli Principle in Few-Body Systems' was held on Oct. 30-31, 1991. A lecture was given by Prof. V.I. Kukulin (Moscow State University) on new physics with the quark-based Moscow N-N potential for few-nucleon systems and on microscopic studies of multi-cluster systems. Seven other speakers gave talks on various roles of the Pauli principle in few-body systems, in multi-cluster systems and in heavy-ion reactions. (J.P.N.).

27821 (JINR-R–4-92-253) **Influence of quantum effects and interaction nonlocality on the 3^-, 2^- and 1^- excitations.** Bal'butsev, E.B.; Molodtsova, I.V.; Unzhakova, A.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [14p.] (In Russian). Order Number DE93630012. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Yad. Fiz.

The method of Wigner function moments is applied to calculate energies and excitation probabilities of 3^-, 2^- and 1^- states with Skyrme forces. Two possible parametrisations of currents, the role of quantum corrections to Vlasov equation and the problem of the so-called 'nested' equations are investigated. 13 refs.; 4 figs.; 2 tabs.

27822 (LBL–33031) **Relativistic mean-field calculations of Λ and Σ hypernuclei.** Glendenning, N.K. (Lawrence Berkeley Lab., CA (United States)); Von-Eiff, D.; Haft, M.; Lenske, H.; Weigel, M.K. Lawrence Berkeley Lab., CA (United States). 24 Oct 1992. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015269. Source: OSTI; NTIS; GPO Dep.

Single-particle spectra of Λ and Σ hypernuclei are calculated within a relativistic mean-field theory. The hyperon couplings used are compatible with the Λ binding in saturated nuclear matter, neutron-star masses and experimental data on Λ levels in hypernuclei. Special attention is devoted to the spin-orbit potential for the hyperons and the influence of the ρ-meson field (isospin dependent interaction).

27823 (IPNO-DRE–92-36) **Spectroscopic measurements using isotope separator on-line facilities.** Sauvage, J. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1992. [22p.] (CONF-9210368–: 6. Franco-Japanese Colloquium on nuclear structures and inter-disciplinary topics, St. Malo (France), 6-10 Oct 1992). Order Number DE93628658. Source: OSTI; NTIS (US Sales Only); INIS.

Isotope Separator On-Line facilities (such as ISOCELE, IGISOL and ISOLDE) together with some detection techniques are briefly described. Results concerning soft nuclei located around A = 120 and A = 186 are discussed stressing similarities and differences. The comparison of theoretical and experimental results on γ - vibrational bands in Hg isotopes is presented. The existence of an abnormal M1 transition in ^{187} Pt is discussed. The work on microweight quantities of ^{178m2} Hg is touched upon.

27824 (LA-UR–93-1971) **Angular correlations in neutron beta decay.** Bowles, T.J. Los Alamos National Lab., NM (United States). [1993]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9301111–1: Colloquium in honor of Walter Mampe, Grenoble (France), 29 Jan 1993). Order Number DE93014349. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses a new generation experiment searching for time reversal violation in polarized neutron beta decay.

27825 (LBL–33904) **Thick-target yields of iodine isotopes from proton interactions in Te, and the double-β decay of ^{128,130}Te.** da Cruz, M.T.F. (Lawrence Berkeley Lab., CA (United States)); Chan, Y.D.; Garcia, A.; Larimer, R.M.; Lesko, K.T.; Norman, E.B.; Rossi, D.F.; Stokstad, R.G.; Zlimen, I.; Wietfeldt, F.E.; Bardayan, D.W.; Hindi, M.M. Lawrence Berkeley Lab., CA (United States). 29 Mar 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930779–14: International cosmic-ray conference, Calgary (Canada), 19-20 Jul 1993). Order Number DE93013914. Source: OSTI; NTIS; INIS; GPO Dep.

We report thick-target yields of ^{126,128,130}I from the bombardment of natural Te targets with 15-, 30-, 45- and 50-MeV protons, together with the iodine production cross sections for 1.85- and 5.0-GeV protons. With these data, we have estimated the relative cosmic-ray induced production of ^{126}Xe, ^{128}Xe and ^{130}Xe in Te ores. These quantities affect the ratio of double-β decay half-lives of ^{130}Te and ^{128}Te. A revised correction of cosmic-ray induced xenon can change the half-life ratio by as much as 10%, from $(3.52\pm0.11) \times 10^{-4}$ to $(3.88\pm0.14) \times 10^{-4}$.

27826 (ORNL/FTR–4353) **Travel to Germany for conference on nuclei far from stability and conference on atomic masses and fundamental constants: Foreign trip report, July 18–26, 1992.** Toth, K.S. Oak Ridge National Lab., TN (United States). 5 Aug 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013006. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report presents a summary of the activities of the traveler and information derived while participating in the joint meeting of the Sixth International Conference on Nuclei Far From Stability and of the Ninth International Conference on Atomic Masses and Fundamental Constants, Bernkastel-Kues, Germany.

27827 (CONF-921046–21) **Approximate methods for derivation of covariance data.** Tagesen, S. (Vienna Univ. (Austria). Inst. fuer Radiumforschung und Kernphysik); Larson, D.C. Oak Ridge National Lab., TN (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Symposium on nuclear data evaluation methodology; Upton, NY (United States); 12-16 Oct 1992. Order Number DE93015969. Source: OSTI; NTIS; INIS; GPO Dep.

Several approaches for the derivation of covariance information for evaluated nuclear data files (EFF2 and ENDF/B-VI) have been developed and used at IRK and ORNL respectively. Considerations, governing the choice of a distinct method depending on the quantity and quality of available data are presented, advantages/disadvantages are discussed and examples of results are given.

27828 (DOE/ER/40768–1) **The theory of relativistic heavy ion collisions: Progress report.** State Univ. of New York, Stony Brook, NY (United States). Dept. of Physics. Jul 1993. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-93ER40768. Order Number DE93015934. Source: OSTI; NTIS; INIS; GPO Dep.

This program began in January 1993. Its primary goals are studies of highly excited matter and its production in nuclear collisions at very high energies. After a general orientation on the project, abstracts describing the contents of completed papers and providing some details of current projects are given. Principal topics of interest are the following: the dynamics of nuclear collisions at very high energies (RHIC and LHC), the dynamics of nuclear collisions at AGS energies, high-temperature QCD and the physics of the quark-gluon plasma, and the production of strangelets and other rare objects.

27829 (GANIL-P–92-22) **The fragmentation-inactivation binary model.** Botet, R. (Paris-11 Univ., 91 - Orsay (France). Lab. de Physique des Solides); Ploszajczak, M. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1992. [18p.] Order Number DE93631866. Source: OSTI; NTIS (US Sales Only); INIS.

A novel fragmentation model is developed in which the fragmentation cascade is randomly inactivated according to the homogeneous inactivation probability function. For the multiplicative break-up kernel $F_{i,j}=(ij)^{\alpha}$, the existence of scaling solution as $t \rightarrow \infty$ in different regions of the phase-diagram is discussed. Fluctuations in the cluster-size distribution is also studied, and an intermittent behavior is found in the infinite-cluster phase and at the transition line. The relevance of this model for nuclear multifragmentation is discussed. (K. A.) 16 refs.; 4 figs.

27830 (ANL/PHY/CP–79497) **Research at the Fragment Mass Analyzer at ATLAS.** Davids, C.N. (Argonne National Lab., IL (United States)); Back, B.; Carpenter, M.P.; Freer, M.; Henderson, D.J.; Henry, R.G.; Janssens, R.V.F.; Khoo, T.L.; Lauritsen, T.; Liang, Y.; Wuosmaa, A.H.; Bearden, I.G.; Daly, P.J.; Fornal, B.; Grabowski, Z.W.; MayArgonne National Lab., IL (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9305203–1: International school seminar on heavy ion physics, Dubna (Russian Federation), 10-15 May 1993). Order Number DE93015144. Source: OSTI; NTIS; INIS; GPO Dep.

The experimental program at the Fragment Mass Analyzer (FMA) at the ATLAS accelerator is well under way. Experiments have been carried out at the target position and at the focal plane. After a brief facility description, some recent experimental results are presented.

27831 (BNL–48694) **Baryon distributions in heavy ion collisions at AGS energies: An experimental overview.** Videbaek, F. Brookhaven National Lab., Upton, NY (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930173–8: HIPAGS meeting, Cambridge, MA (United States), 14-17 Jan 1993). Order Number DE93014045. Source: OSTI; NTIS; INIS; GPO Dep.

Data on rapidity distributions of protons from the three AGS experiments E-814, E-810 and E-802 are compared on a common base to enlarge the rapidity coverage. Together they provide a unique opportunity to study the proton distributions in relativistic heavy ion reactions over the full rapidity range. Systematics of the rapidity density distributions are presented as function of centrality and mass of colliding system. Considerable stopping is achieved for the heaviest system studied, Au+Au, thus giving the means to study high-density effects in nuclear matter.

27832 (BNL–48880) **Meson interferometry in relativistic heavy ion collisions.** Brookhaven National Lab., Upton, NY (United States). 1993. 211p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9304122–: Meson interferometry in relativistic heavy ion collisions, Upton, NY (United States), 16-17 Apr 1993). Order Number DE93013143. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains discussions on the following topics: Recent HBT results form CERN experiment NA44; interferometry results from E802/E859/E866; recent results on two particle correlations from E814; source sizes from CERN data; intermittency and interferometry; Bose-Einstein correlations in 200A GeV S+Au collisions; HBT correlations at STAR; HBT interferometry with PHENIX; HBT calculations from ARC; three pion correlations; and pion correlations in proton-induced reactions.

27833 (BNL–48888) **Physics at the AGS with a relativistic cascade.** Kahana, S.H.; Pang, Yang; Schlagel, T.J. Brookhaven National Lab., Upton, NY (United States). Feb 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930173–10: HIPAGS meeting, Cambridge, MA (United States), 14-17 Jan 1993). Order Number DE93014292. Source: OSTI; NTIS; INIS; GPO Dep.

The relativistic cascade code ARC is applied to the results from heavy ion collisions, at a laboratory energy of 14.6 GeV/c per nucleon, for a variety of projectiles and targets. A detailed discussion is given of the physics and inputs of this cascade. No deviation between ARC and experiment has yet been identified as a possible signal of collective hadronic behaviour.

27834 (BNL–70173) **Purpose of the trip was to hold discussions with several institutions in Russia on their prospective collaboration with the PHENIX experiment at the BNL Relativistic Heavy Ion Collider (RHIC): Foreign trip report, March 29, 1992–April 4, 1992.** Aronson, S.H. Brookhaven National Lab., Upton, NY (United States). 8 Jul 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93013815. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The report describes discussions with scientific representatives of four research laboratories in Russia which had previously indicated interest in participating in PHENIX, an experiment at RHIC which focuses on dilepton and direct photon signals of the Quark-Gluon Plasma (QGP). Some tentative agreements were reached with these institutions concerning their collaboration in PHENIK. Issues were identified with require further discussion in the process of completing official agreements.

27835 (CEA-LNS-Ph–92-04) **Subthreshold inclusive η production in nuclei by 1 GeV protons.** Chiavassa, E. (Istituto Nazionale di Fisica Nucleare, Turin (Italy)); Dellacasa, G.; Marco, N. de; Ferrero, F.; Musso, A.; Piccotti, A.; Scomparin, E.; Vercellin, E.; Gallio, M.; Bertini, R.; Durand, J.M.; Brochard, F. Submitted to Zeitschrift fuer Physik, A (DE).

The doubly differential cross-section for the η production in the reaction $p+A \rightarrow X+\eta$ has been measured on ^{6}Li, C, Al, Cu and Au targets using a proton beam of 1 GeV kinetic energy of the Saturne protosynchrotron in Saclay. η mesons were detected by a two arm neutral meson spectrometer, PINOT. The A dependence of the doubly differential production cross-section is provided and is compared to theoretical predictions. (author) 19 refs.; 4 figs.

27836 (CONF-920721–15) **High spin states in neutron rich nuclei from spontaneous fission.** Butler-Moore, K. (Vanderbilt Univ., Nashville, TN (United States). Dept. of Physics); Zhu, S.; Zhao, X.; Hamilton, J.H.; Ramayya, A.V.; Lu, Q.; Ma, W.C.; Peker, L.K.; Kormicki, J.; Deng, J.K.; Gore, P.; Shi, D.; Jones, E.F.; Xie, H.; Gao, W.B.; Cole, J.D.;Vanderbilt Univ., Nashville, TN (United States). Dept. of Physics; Oak Ridge National Lab., TN (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER40407 ;AC05-84OR21400. From 6. international conference on nuclei far from stability and 9th international conference on atomic masses and fundamental constants; Bernkastel-Kues (Germany); 19-24 Jul 1992. Order Number DE93013889. Source: OSTI; NTIS; INIS; GPO Dep.

One fragment-γ-γ and three γ-γ coincidence measurements of the prompt γ-rays from the fragments produced in the spontaneous fission (SF) of ^{252}Cf and very recently of ^{242}Pu were carried out with a 20 Ge detector ball at HHIRF. With our high statistics, γ-γ-γ coincidences where the two gates are on transitions in the two partner fragments were extracted. Comparing the ^{252}Cf and ^{242}Pu data allowed unique placements of many transitions. New, higher spin states were observed in many nuclei, up to 16$^+$ in some of the heavy partners. Levels in several nuclei were observed for the full time. Studies of the fission process included measured relative branchings to the 1n to 6n channels. Much data remains to be analyzed. These data provide new insights into the changing structures at higher spins of many neutron-rich nuclei and the fission process.

27837 (CONF-9210173–6) **Covariance matrix of model parameters and uncertainties of calculated neutron cross sections on ^{19}F.** Zhao, Zhixiang (Academia Sinica, Beijing, BJ (China). Inst. of Atomic Energy); Fu, C.Y.; Larson, D.C. Oak Ridge National Lab., TN (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Nuclear Energy Agency Science Committee (NEANSC) specialists meeting on evaluation and processing of covariance data; Oak Ridge, TN (United States); 7-9 Oct 1992. Order Number DE93015798. Source: OSTI; NTIS; INIS; GPO Dep.

A simplified method to estimate covariance matrix the model parameters is presented in this work and applied to calculate covariance matrix of calculated cross sections on ^{19}F.

27838 (CRN–92-09) **Preequilibrium to evaporation residues: dynamical approach to intermediate energy nucleus-nucleus collisions.** Krishan, K. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires); Wagner, P.; Coffin, J.P.; Rami, F.; Bhattacharya, S. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. [1992]. [29p.] Order Number DE93631881. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Physical Review, C (US).

Dynamical evolution of the nucleus-nucleus collisions in the Fermi energy domain is followed from the point of interaction to the evaporation residues on event by event basis by Monte-Carlo simulation technique. The complete reaction process comprises two phases, (i) the preequilibrium phase and (ii) the evaporation phase. The initial preequilibrium phase leads to the formation of an incompletely fused composite which, assumed to be thermally equilibrated, subsequently decays leading to final residues. The calculations are parameter free. The calculated inclusive residue charge distribution, exclusive proton and α-particle spectra and other physical observables for the reaction ^{40}Ar + ^{24}Mg and ^{40}Ar + ^{13}C at 1100 MeV are compared with the respective experimental data. The theoretical predictions are found to be in good agreement with the experimental results. (author) 15 refs.; 8 figs.

27839 (CRN–92-27) **Resonant and nonresonant behavior of the heavy-ion reaction ^{14}C + ^{12}C.** Freeman, R.M. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires); Haas, F.; Youlal, M.; Hachem, A.; Monnehan, G.A.; Basrak, Z. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. [1992]. [34p.] Order Number DE93631882. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Physical Review, C (US).

The ^{14}C + ^{12}C reaction has been studied by a kinematic coincidence technique at 13 incident energies ranging from $E_{c.m.}$=19.35 to 24.9 MeV. The resonances previously reported from γ-ray yield measurements were observed in the equivalent excitation functions, as well as in the large angle elastic scattering data, of the present measurements. Spin assignments were made to the two resonances in this energy range. These resonances are members of a band with angular momenta several units larger than the grazing values corresponding to ^{14}C and ^{12}C orbiting about each other at a distance significantly outside the strong absorption radius. Other structures which were observed were unrelated to the resonant behavior. (author) 22 refs.; 14 figs.

27840 (CRN–92-43) **Folding model analysis of ^{58}Ni + ^{64}Ni elastic and inelastic scattering at E_{lab}=203.8 and 219.2 MeV.** Ruiz, J.A. (Valencia Univ. (Spain). Inst. de Fisica Corpuscular); Ferrero, J.L.; Bilwes, B.; Bilwes, R. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. 1992. [25p.] Order Number DE93631883. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nuclear Physics (US).

Angular distributions of elastic scattering of ^{58}Ni by ^{64}Ni and inelastic scattering leading to the first 2$^+$ state in ^{58}Ni or in ^{64}Ni were measured at E_{lab}=203.8 and 219.2 MeV. The data were analyzed in the frame of the folding model. A renormalization N of the folding potential consistently lower than unity (N≈0.65) is needed to reproduce the elastic scattering data. Coupled-channel calculations including the main inelastic channels explain partly this discrepancy. They reproduce the elastic and inelastic scattering data with a renormalization of N≈0.8 at both energies. Interference between Coulomb and nuclear excitation is shown to play an important role in the repulsive character of the polarization potential. (author) 38 refs.; 6 figs.; 1 tab.

27841 (GANIL-P–92-07) **K$^+$ production far below the free nucleon-nucleon threshold in heavy-ion collisions.** Belkacem, M. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)); Suraud, E.; Ayik, S. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). [1992]. [12p.] Order Number DE93631884. Source: OSTI; NTIS (US Sales Only); INIS.

The K$^+$ production cross-section far below the free nucleon-nucleon production threshold is estimated in ^{12}C + ^{12}C collisions using simulations of the Boltzmann and the Boltzmann-Langevin equations. Fluctuations increase substantially the cross-sections especially at low beam energies. An estimate of the K$^+$ yield in ^{42}Ca + ^{42}Ca collisions at an incident energy of 90 MeV/n is also given, in order to compare these result to recent experimental data obtained in a similar system by Julien et al. (author) 14 refs.; 2 figs.; 2 tabs.

27842 (GANIL-P–92-15) **Static aspects of the fission and fusion of liquid ^{3}He drops.** Guilleumas, M. (Barcelona Univ. (Spain). Facultad de Fisica); Barranco, M.; Pi, M.; Garcias, F.; Suraud, E. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). [1992]. [26p.] Order Number DE93631876. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Zeitschrift fuer Physik, D (DE).

Using an effective ^{3}He-^{3}He interaction, the fission and fusion of ^{3}He drops have been investigated from a static point of view. The calculations show that a fission barrier develops for these neutral systems, and that their saddle configurations are rather elongate. The transition from oblate to prolate shapes as a function of the angular momentum L, as well as critical values for fission and fusion are discussed for some selected cases. A kind of proximity potential can be extracted from the drop-drop interaction potentials. (author) 33 refs.; 9 figs.

27843 (GANIL-P–92-17) **Fission of spin-aligned projectile-like nuclei in the interactions of 29 MeV/nucleon ^{208}Pb with ^{197}Au.** Bresson, S. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)); Morjean, M.; Jastrzebski, J.; Skulski, W.; Bougault, R.; Colin, J.; Horn, D.; Gatty, B. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). [1992]. [14p.] Order Number DE93631896. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Physics Letters, B. (NL).

Binary fission of projectile-like nuclei was investigated in the interaction of 29 MeV/nucleon Pb on Au, together with the associated neutron multiplicity. Fission is only observed in rather peripheral collisions and represents approximately 20% of the total reaction cross-section. The fission process occurs after collisions in which up to 550 MeV have been dissipated. The angular and energy distribution of the fragments can be accounted for by assuming a noticeable spin alignment of the fissioning nuclei. (author) 18 refs.; 3 figs.

27844 (GANIL-P–92-18) **Nuclear fission with a Langevin equation.** Boilley, D. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)); Suraud, E.; Abe, Yasuhisa; Ayik, S. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). [1992]. [28p.] Order Number DE93631897. Source: OSTI; NTIS (US Sales Only); INIS.

A microscopically derived Langevin equation is applied to thermally induced nuclear fission. An important memory effect is pointed out and discussed. A strong friction coefficient, estimated

from microscopic quantities, tends to decrease the stationary limit of the fission rate and to increase the transient time. The calculations are performed with a collective mass depending on the collective variable and with a constant mass. Fission rates calculated at different temperatures are shown and compared with previous available results. (author) 23 refs.; 7 figs.

27845 (GANIL-P–92-20) **Elastic scattering of a secondary ^{11}Li beam on ^{28}Si at 29 MeV/n.** Lewitowicz, M. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)); Borcea, C.; Carstoiu, F.; Bimbot, R.; Borrel, V.; Dogny, S.; Gareev, F.A.; Ershov, S.N.; Dlouhy, Z.; Nosek, L. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). [1992]. [21p.] Order Number DE93631885. Source: OSTI; NTIS (US Sales Only); INIS.

The elastic scattering of a secondary ^{11}Li beam (29 MeV/n) on a ^{28}Si target has been measured for the first time. To compensate for the low intensity of the secondary beam, an efficient detecting system permitting to obtain reliable experimental data has been used. An attempt has been made to reproduce the data in a phenomenological analysis and with coupled-channel calculations with a double folding optical potentials, with energy and density dependent effective interaction and realistic densities. In coupled-channel calculations with the folding optical potential a better description is achieved if a neutron halo of ^{11}Li is taken into account. (author) 30 refs.; 7 figs.; 4 tabs.

27846 (GANIL-P–92-23) **Emission of complex fragments in the reaction Ar+Au at 44 and 77 A.MeV.** Sokolov, A. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)); Guerreau, D.; Jiang, D.X.; Charvet, J.L.; Frehaut, J.; Cramer, B.; Ingold, G.; Gatty, B. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1992. [44p.] Order Number DE93631886. Source: OSTI; NTIS (US Sales Only); INIS.

Complex fragment emission from the 44 and 77 A.MeV ^{40}Ar + ^{197}Au reaction was investigated, and complex fragments have been detected, together with the associated neutron multiplicity distributions, and are seen to be preferentially emitted in violent collisions. Equilibrium and non-equilibrium components were identified which are discussed in terms of statistical emission from the hot target-like fragment and of a possible persistence of a deep-inelastic process. (R.P.) 45 refs.; 16 figs.; 1 tab.

27847 (ISN–92-102) **Reaction ^{40}Ca+^{nat}Cu at 35 MeV/nucleon measured with the AMPHORA multidetector. Study of the excitation energy and angular momentum of the reconstructed projectile-like fragment.** Elhage, H. Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires. Oct 1992. [102p.] (In French). Order Number DE93631887. Source: OSTI; NTIS (US Sales Only); INIS.

We have studied the reaction of ^{40}Ca with ^{nat}Cu at 35 MeV/nucleon with the AMPHORA multidetector. Three different reaction models were developed and we have shown that a simulation of the AMPHORA response is necessary to interpret the experimental results. Only two-body events were analyzed. Kinematic selection criterions, based on relative velocity, were used in order to isolate particles and residues coming from the de-excitation of the projectile-like fragment. The reconstitution of such a nucleus allowed to define the reaction plane and to calculate the energy balance event-by-event. We have proposed a method to determine the angular momentum based on the emission asymmetry of the light particles with respect to the normal to the reaction plane. The estimated angular momenta are in good agreement with the theoretical predictions. The projectile-like fragment temperature was estimated from the energy spectra of the light particles. The independent determination of the excitation energy, temperature and angular momentum allowed to calculate the level density parameter. This quantity does not evolve with the excitation energy and is equal to A/8. The projectile-like fragment de-excitation mode is mainly evaporation.

27848 (JAERI-M–92-202) **Report of the joint seminar on solid state physics, atomic and molecular physics, and materials science in the energy region of tandem accelerators.** Kazumata, Yukio (ed.) (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1993. 103p. (In Japanese, English). (CONF-9101168–: Joint seminar on solid state physics, atomic and molecular physics, and material science in the energy region of tandem accelerators, Tokai (Japan), 22-23 Jan 1991). Order Number DE93508268. Source: OSTI; NTIS; INIS.

The joint seminar on Solid State Physics, Atomic and Molecular Physics and Materials Science in the Energy Region of Tandem Acceleration was held at Tokai Research Establishment of JAERI, for two days from January 22 to 23, 1991. About 60 physicists and material scientists participated and 18 papers were presented in this seminar. The topics presented in this seminar included lattice defects in semiconductors, ion-solid collisions, atomic collisions by high energy particles, radiation effects on high T_c superconducting materials and FCC metals, radiation effects on materials of space and fusion reactors, uranium compounds and superlattice. (J.P.N.).

27849 (JAERI-M–93-020) **Neutron-photon multigroup cross sections for neutron energies up to 400 MeV: HILO86R: Revision of HILO86 library.** Kotegawa, Hiroshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Nakane, Yoshihiro; Hasegawa, Akira; Tanaka, Shun-ichi. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1993. 32p. Order Number DE93508285. Source: OSTI; NTIS; INIS.

A macroscopic multigroup cross section library of 66 neutron and 22 photon groups for neutron energies up to 400 MeV: HILO86R is prepared for 10 typical shielding materials; water, concrete, iron, air, graphite, polyethylene, heavy concrete, lead, aluminum and soil. The library is a revision of the DLC-119/HILO86, in which only the cross sections below 19.6 MeV have been exchanged with a group cross section processed from the JENDL-3 microscopic cross section library. In the HILO86R library, self shielding factors are used to produce effective cross sections for neutrons less than 19.6 MeV considering rather coarse energy meshes. Energy spectra and dose attenuation in water, concrete and iron have been compared among the HILO, HILO86 and HILO86R libraries for different energy neutron sources. Significant discrepancy has been observed in the energy spectra less than a couple of MeV energy in iron among the libraries, resulting large difference in the dose attenuation. The difference was attributed to the effect of self-shielding factor, namely to the difference between infinite dilution and effective cross sections. Even for 400 MeV neutron source the influence of the self-shielding factor is significant, nevertheless only the cross sections below 19.6 MeV are exchanged. (author).

27850 (JAERI-M–93-050) **Installation of Monte Carlo neutron and photon transport code system MCNP4: Improvements of graphic functions and cross section library for Sun work stations.** Takano, Makoto (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Sasaki, Mikio; Kaneko, Toshiyuki; Yamazaki, Takao. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 78p. (In Japanese). Order Number DE93508321. Source: OSTI; NTIS; INIS.

The continuous energy Monte Carlo code MCNP-4 including its graphic functions has been installed on the Sun-4 sparc-2 work station with minor corrections. In order to validate the installed MCNP-4 code, 25 sample problems have been executed on the work station and these results have been compared with the original ones. And, the most of the graphic functions have been demonstrated by using 3 sample problems. Further, additional 14 nuclides have been included to the continuous cross section library edited from JENDL-3. (author).

27851 (JINR-E–1-91-496) **The differential cross sections for inclusive reactions π^++A→η+X at 10 GeV.** Budagov, Yu.A. (and others); Chirikov-Zorin, I.E.; Dzhelepov, V.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. [16p.] Order Number DE93630050. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nucl. Phys., B.

The differential cross sections are presented for inclusive reactions π^++A→η+X on H, D, Li, Be, Al, Cu nuclei at the energy of 10.5 GeV in the beam fragmentation region. The fragmentation process $\pi \rightarrow \eta$ is described within the framework of the string model which allows for colour transparency of nuclei and effects of final-state formation length. Taking into account the QCD-predicted dependence of the interaction cross section on the quark structure

of hadrons one can qualitatively describe this process for a large group of target nuclei. 15 refs.; 11 figs.; 3 tabs.

27852 (JINR-E-2-91-562) **On anomalous ^{24}Na production in high-energy nuclear interactions.** Polanski, A.; Sosnin, A.N.; Toneev, V.D. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. [14p.] Order Number DE93630045. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to At. Ehnerg.

Recent experiments on anomalously high production of ^{24}Na fragments at large angles in high-energy C-Cu interactions are analysed starting from a cascade-evaporation model (CEM) and taking into consideration effects of particle transport through a matter. It turned out that no unusual mechanism of nucleus-nucleus collisions is needed to explain the experimental results. 14 refs.; 4 figs.; 5 tabs.

27853 (JINR-R-1-92-45) **The transverse cross section in ^{16}Op interactions at 3.1 AxGev/c and isotope composition of two-charge fragments.** Botvina, A.S. (AN SSSR, Moscow (Russian Federation). Inst. Yadernykh Issledovanij); Buzdavina, N.A.; Wislicki, W. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1992. [7p.] (In Russian). Order Number DE93630039. Source: OSTI; NTIS (US Sales Only); INIS.

The experimental data for the transverse cross section, multiplicity and relative yield of two-charge fragments of the oxygen nucleus (^{3}He$_2$ and ^{4}He$_2$ nuclei), produced in ^{16}Op-interactions at momentum 3.1 AxGeV/c are presented. The data are compared with the results made in the frame of the cascade-fragmentation-evaporation model of proton-nucleus interactions. 7 refs.; 5 figs.

Lab. of Neutron Physics. 1992. [8p.] (In Russian). Order Number DE93630040. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Yad. Fiz.

The neutron strength functions and scattering radii R'_0 and R'_1 for s- and p-waves were calculated from differential neutron scattering cross sections of ^{128}Te and ^{130}Te isotopes measured at up to ≈300 keV neutron energies for three different angles. As for earlier investigated natural isotope mixture of Te the radii of p scattering are essentially less than for neighbouring nuclei, while average R' for the rest isotopes of Te is, apparently, 'normal'. The possibility is demonstrated to explain this anomaly through doorway states being formed in ^{129}Te and ^{131}Te compound nuclei with spins and parities $1/2^-$ and (or) $3/2^-$. 5 refs.; 5 figs.; 1 tab.

27855 (JINR-R-3-92-245) **Analysis of the nonstatistical behaviour of the radiative strength function at capture of thermal and resonance neutron.** Vasil'eva, Eh.V.; Vojnov, A.V.; Kulik, V.D.; Popov, Yu.P.; Sukhovoj, A.M.; Khitrov, V.A.; Khol'nov, Yu.V.; Shilin, V.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1992. [15p.] (In Russian). Order Number DE93630041. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Yad. Fiz.

In this work a method is suggested of a search for nonstatistical regularities in behaviour of radiative strength fucntion of primary γ-transitions from the (n, γ) reaction. The correlation analysis of the primary γ-transition intensities for the ^{174}Yb, ^{168}Er, ^{178}Hf nuclei has been carried out on the basis of the data from thermal and 2 keV neutron capture experiments. The positive values obtained for the correlation coefficient in the case of ^{174}Yb and ^{168}Er allow the conclusion to be made, at a high level of confidence, about the presence of considerable deviations of the radiative strength function from mean statistical value. 20 refs.; 6 figs.; 1 tab.

27856 (LA–12560-T) **Reaction mechanism and nuclear correlations study by low energy pion double charge exchange.** Weinfeld, Z. Los Alamos National Lab., NM (United States). Jun 1993. 143p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93015863. Source: OSTI; NTIS; INIS; GPO Dep.

Thesis submitted to Tel Aviv Univ. (IL).

In pion double-charge-exchange (DCX) reactions, a positive (negative) pion is incident on a nucleus and a negative (positive) pion emerges. These reactions are of fundamental interest since the process must involve at least two nucleons in order to conserve charge. Although two nucleon processes are present in many reactions they are usually masked by the dominant single nucleon processes. DCX is unique in that respect since it is a two nucleon process in lowest order and thus may be sensitive to two-nucleon correlations. Measurements of low energy pion double-charge-exchange reactions to the double-isobaric-analog-state (DIAS) and ground-state (GS) of the residual nucleus provide new means for studying nucleon-nucleon correlations in nuclei. At low energies (T_π <65 MeV) the πN interaction is relatively weak thus simplifying the theoretical treatment of the problem. Also, isobaric-analog-state (IAS) transitions are suppressed near 50 MeV due to destructive s-p wave interference in the πN scattering amplitude leading to enhancement of DIAS transitions through non-analog intermediate states. Theoretical studies by several groups have shown that, while transitions through the analog route involve relatively large nucleon-nucleon distances, those through the non-analog intermediate states involve distances of the order 1 to 2 fm. Therefore, DCX reactions at low incident pion energies provide a way to study the short-range part of the nucleon-nucleon correlations. The author presents measured DCX cross sections of DIAS and GS transitions for several nuclei in the $f_{7/2}$ shell at energies ranging from 25 to 65 MeV. Cross sections were measured on ^{42,44,48}Ca, ^{46,50}Ti and ^{54}Fe. The calcium isotopes make a good set of nuclei on which to study the effects of correlations in DCX reactions.

27857 (LA-UR–93-1692) **Dynamics of pion-nucleus systems.** Johnson, M.B. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930389–13: Future directions in particle and nuclear physics at multi-GeV hadron beam facilities, Upton, NY (United States), 4-6 Mar 1993). Order Number DE93014449. Source: OSTI; NTIS; INIS; GPO Dep.

The prospects for using high-energy pions to examine modifications of baryon resonances in nuclei, nuclear structure, exchange currents, short-range correlations, and to characterize pion propagation are discussed.

27858 (LBL–34008) **Complex fragment production and multifragmentation in 60 MeV/u ^{129}Xe-induced reactions.** Wozniak, G.J.; Skulski, W.; Tso, K.; Colonna, N.; Moretto, L.G. Lawrence Berkeley Lab., CA (United States). Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930197–4: 9. winter workshop on nuclear dynamics, Key West, FL (United States), 30 Jan - 6 feb 1993). Order Number DE93015176. Source: OSTI; NTIS; INIS; GPO Dep.

Complex fragment production has been studied in nearly 4π geometry for the 60 MeV/u ^{129}Xe + ^{27}Al, ^{nat}Cu, ^{89}Y, ^{165}Ho and ^{197}Au reactions. The total number of light charged particles and complex fragments increases strongly with the mass of the target, reaching values of 40 for the ^{197}Au target. The yield of intermediate mass fragments reaches values greater than 10 for central collisions on ^{197}Au. For a subset of the events, 80% of the total charge in the reaction channel is detected.

27859 (LPCC–92-02) **Excitation energy distributions in fusion reactions induced by Ar projectiles at 50 and 70 MeV/u.** Vient, E. (Caen Univ., 14 (France). Source: OSTI; NTIS (US Sales Only); INIS.

In the present experiment, we have studied the Ar+Ag system at two bombarding energies: 50 and 70 MeV/u. We have first focused on the standard decay of the corresponding hot nuclei, i.e. on the formation of evaporated residues, which have been detected in coincidence with most of the decay charged particles (use of a 4 π device). From this very complete knowledge of the events, it has been possible to determine the excitation energy distribution of the

initial hot nuclei. In a second step of the analysis, we have extended the triggering conditions to more complicated events including multi-fragment emission. In section 2 of this paper, we describe the experimental set up. Section 3 is devoted to the results involving an evaporation residue. Section 4 is devoted to triggering conditions based on the multiplicity detected in the 4 π device. Section 5 is a summary of the results.

27860 (LPCC–92-03) **Inversion of collective matter flow and equation of state.** Peter, J. Caen Univ., 14 (France). Lab. de Physique Corpusculaire. Mar 1992. [13p.] (CONF-920318–: International workshop on dynamical fluctuations and correlations in nuclear collisions, Aussois (France), 12-20 Mar 1992). Order Number DE93631890. Source: OSTI; NTIS (US Sales Only); INIS.

The multidetector array Mur + Tonneau has been used to perform a 4π detection of charged particles and fragments emitted in reactions at energies ranging from 25 to 95 MeV/u. The collective transverse momentum in the reaction plane (sidewards flow parameter) is observed to strongly vary as a function of impact parameter and incident energy. The measured values have to be corrected for the effects due to the error on the reaction plane determination and to the detector limitations. Those limitations caused by the method itself are more important than those caused by the detector. The flow value changes from negative values (negative scattering at low energies). The inversion (or balance) energy is in the range 50-100 MeV/u, depending on the system and impact parameter value. Comparisons between experimental data and theoretical values are shown for the system ^{40} Ar + ^{27} Al. These studies (BUU, Landau-Vlasov, QMD) show that the flow, and especially the inversion energy, is sensitive to the nucleon-nucleon cross section σNN in medium. The data indicate that a momentum dependent effective interaction should be used. Then, the flow value is not much sensitive to the incompressibility modulus K, but possibly in peripheral collisions. Additional observables should be used. The azimuthal distribution of mid-rapidity particles indicates a rotation-like behaviour of the interaction region.

27861 (LPCC–92-04) **Charged particle calorimetry of ^{40}Ar + ^{27}Al reactions from 36 to 65 MeV/u.** Cussol, D. (Caen Univ., 14 (France). Lab. de Physique Corpusculaire); Bizard, G.; Brou, R.; Durand, D.; Louvel, M.; Patry, J.P.; Peter, J.; Sullivan, J.P.; Regimbart, R.; Steckmeyer, J.C.; Tamain, B.; Doubre, H.; Peghaire, A.; Saint-Laurent, F.; Crema, E. Caen Univ., 14 (France). Lab. de Physique Corpusculaire; Caen Univ., 14 (France). Apr 1992. [27p.] Order Number DE93631891. Source: OSTI; NTIS (US Sales Only); INIS.

Temperatures and excitation energies have been independently measured for hot nuclei formed in the Ar on Al reactions from 36 to 65 MeV/u. Charged products have been measured in a geometry close to 4 π in the center of mass with multidetectors MUR and TONNEAU. The events have been sorted as a function of the impact parameter value. The products emitted from the equilibrated incomplete fusion nuclei are separated from the nucleons and clusters emitted in the first step of the collision (pre-equilibrium) and from the target-like nuclei. The qualitative variation of temperature and excitation energy values have been deduced from the charge distribution of residual nuclei and the transverse energy. Quantitative values are obtained from the kinetic energy distributions of particles in the frame of the reconstructed equilibrated nucleus. At each incident energy, the temperature and excitation energy are both increasing when the impact parameter value decreases. For central collisions (b<2fm), the temperature increases with the incident energy, slowly above 45 MeV/u, and reaches a value of 7 MeV. The excitation energy per nucleon increases similarly. The correlation between the excitation energy per nucleon and the temperature shows an evolution of the level density parameter value.

27862 (LPCC–92-05) **High transverse momentum events in Kr+Au, Th central collisions at 43 MeV/u.** Bougault, R. (Caen Univ., 14 (France). Lab. de Physique Corpusculaire); Colin, J.; Delaunay, F.; Genoux-Lubain, A.; Le Brun, C.; Lecolley, J.F.; Lefebvres, F.; Louvel, M.; Steckmeyer, J.C.; Adloff, J.C.; Bilwes, B.; Bilwes, R.; Glaser, M.; Rudolf, G.; ScheCaen Univ., 14 (France). Lab. de Physique Corpusculaire. May 1992. [29p.] Order Number DE93631892. Source: OSTI; NTIS (US Sales Only); INIS.

The multi-fragment production of the systems Kr+(Ag,Au,Th) is studied at 43 A.MeV. Heavy fragments ($Z \geq 6$) were identified in coincidence by 4 π arrangement of low threshold detectors. Up to six fragments have been detected per event. An analysis based on relative velocities between the detected fragments allowed us to separate peripheral reactions from central collisions. For the central events large transverse energy values, clue for dynamical effects, are observed for Au- and Th-system.

27863 (LPCC-T–92-02) **Study of Krypton-Silver, Krypton-gold, Krypton-thorium interactions at 27 and 43 MeV/n in terms of global variables.** Lemiere, J. Caen Univ., 14 (France). Lab. de Physique Corpusculaire. Jul 1992. [132p.] (In French). Order Number DE93631888. Source: OSTI; NTIS (US Sales Only); INIS.

The determination of desexcitation mechanism of hot and compressed nuclear systems formed after heavy ions collisions at intermediate energies asks for and exclusive and complete detection of the products of the reaction and so the use of multidetectors with large angular coverage. In this work, we study fragment production (Z>8) in nuclear collisions of krypton projectiles accelerated at 27 MeV/uma and 43 MeV/uma with silver, gold and thorium target with the help of the measurements provided by two gaseous multidetectors DELF and XYZT at GANIL. We observed events with a multiplicity of fragments up to 5 and 6 at 27 and 43 MeV/uma respectively (whatever the nature of target). We restricted our study to central collisions with at least 3 heavy fragments detected by separating peripheral collisions which had kept the memory of entrance channel. The recoil velocity of fragments for central events indicates high excitation energy which is comparable to total binding energy of the system. In order to normalize and compact the information which represent the velocities and charges of the 3, 4 or 5 detected fragments, we used several global variables as flow angle and isotropy ratio. We tested if these variables were no too modified by the limitations of the experimental setup by using Monte Carlo simulations. We observed some important differences between the systems we used: first, more events with large flow angle or isotropy ratio for the gold target than for the silver one, second relatively more events with large isotropy ratio for 43 MeV/uma than for 27 MeV/uma. Events with small flow angle has a weak memory of the entrance channel, but the events with large flow angle do not, this indicates the flow angle to be an estimation of impact parameter. The difference between gold and silver target has been assumed to be due to the difference of overlap cross section of the Kr-Au and Kr-Ag systems.

27864 (CEA-N–2709) **Calculations of neutron cross sections for ^{178}Hf^{m2} in the energy range 10 KeV-3 MeV and for thermal neutrons.** Lagrange, C. CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France). Jan 1993. [22p.] (In French). Order Number DE93631898. Source: OSTI; NTIS (US Sales Only); INIS.

We present coherent optical and statistical model calculations of neutron interactions with the second isomeric state of ^{178} Hf (16$^+$) at incident energies between 10 keV and 3 MeV. As this isomeric state lie in the continuum region the level density parameters of the back-shifted Fermi gas model are employed in the statistical model calculations. The uncertainties of the theoretical calculations arise mainly from the determination of the level density spin distribution for ^{178} Hf. The optical and statistical model parameters are then extrapolated to the calculations of inelastic acceleration of thermal neutrons by ^{178} Hf^{m2} and ^{180} Hf^{m1}. New measurements are suggested to assess the validity of our predictions.

27865 (CONF-9205173–1-Vugraphs) **General order characteristic methods for solving neutron transport problems.** Azmy,

Y.Y. Oak Ridge National Lab., TN (United States). [1992]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International symposium on transport theory; Moscow (Russian Federation); 23-31 May 1992. Order Number DE93015824. Source: OSTI; NTIS; INIS; GPO Dep.

The neutron transport equation in Cartesian geometry possesses straight line characteristics along which the streaming operator can be written as a full differential in terms of the characteristic length. This idea was used by Lathrop to develop the step characteristic method, which he showed to be positive definite but less accurate than conventional Diamond-Difference schemes. Several authors since then have developed new methods utilizing the characteristic curves (including non-Cartesian geometry). A Linear Characteristic Method, based on a more consistent linear representation of the incoming-surface and within-cell angular flux, has been developed and tested in two-dimensional geometry producing highly accurate and computationally efficient results. A similar linear method, with several modifications, was developed for three-dimensional Cartesian geometry, and implemented in ORNL's production code TORT. In this paper is presented a fully consistent, two-dimensional Cartesian geometry, general order characteristic method, in the same spirit as the previously developed, general order nodal method. Preliminary tests and numerical error analysis of the new method for orders up to five are also presented.

27866 (CONF-9304131–7) **Development and application of the automated Monte Carlo biasing procedure in SAS4.** Tang, J.S.; Broadhead, B.L. Oak Ridge National Lab., TN (United States). [1993]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Advanced Monte Carlo computer programs for radiation transport; Saclay (France); 27-29 Apr 1993. Order Number DE93015205. Source: OSTI; NTIS; INIS; GPO Dep.

An automated approach for biasing Monte Carlo shielding calculations is described. In particular, adjoint fluxes from a one-dimensional discrete-ordinates calculation are used to generate biasing parameters for a three-dimensional Monte Carlo calculation. The automated procedure consisting of cross-section processing, adjoint flux determination, biasing parameter generation, and the initiation of a MORSE-SGC/S Monte Carlo calculation has been implemented in the SAS4 module of the SCALE computer code system. The automated procedure has been used extensively in the investigation of both computational and experimental benchmarks for the NEACRP working group on shielding assessment of transportation packages. The results of these studies indicate that with the automated biasing procedure, Monte Carlo shielding calculations of spent fuel casks can be easily performed with minimum effort and that accurate results can be obtained at reasonable computing cost. The systematic biasing approach described in this paper can also be applied to other similar shielding problems.

27867 (DOE/ER/45415–9) **Many-body corrections in XAFS.** Rehr, J.J. Washington Univ., Seattle, WA (United States). Dept. of Physics. [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER45415. (CONF-9208221–2: International workshop on surface x-ray absorption fine structure (XAFS), Jaipur (India), Aug 1992). Order Number DE93011002. Source: OSTI; NTIS; INIS; GPO Dep.

The importance of many-body effects in the theory of XAFS is reviewed. The dominant effects are inelastic losses: Extrinsic losses refer to inelastic losses in the propagation of the photoelectron and are treated using a complex, energy-dependent self-energy. The real part of the self-energy yields an important energy-dependent shift in the phase of the XAFS oscillations, while the imaginary part contributes to the mean-free-path. Intrinsic losses refer to losses associated with the creation of the core-hole. They give rise to shake-up/shake-off contributions to the absorption spectra. These losses may be calculated in terms of a corehole Green's function. Interference between these processes leads to dynamical corrections, which are important at low energies.

27868 (IYaF–91-115) **Solution of the problem of mean energy electron passage through matter.** Arzhannikov, A.V.; Sinitskij, S.L.; Yalovets, A.P. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. [34p.] (In Russian). Order Number DE93630061. Source: OSTI; NTIS (US Sales Only); INIS.

Methods of computerized solution of the problem of 10-100 keV energy electron passage through matter are developed. This may form the basis of theoretical description of rather complex physical phenomena involving participation of such electrons. Validity of accepted approach to solution of the problem and correctness of used physical formulas and numerical factors are verified by comparison of test calculations with experimental results described in publications. 35 refs.; 6 figs.

27869 (JAERI-M–93-024) **Installation and execution of criticality and radiation shielding analysis codes on engineering work station.** Masukawa, Fumihiro (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Takano, Makoto; Inoue, Osamu; Hara, Toshiharu. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1993. 36p. (In Japanese). Order Number DE93508312. Source: OSTI; NTIS; INIS.

Nowadays, the performance of the engineering work stations (EWS) shows remarkable progress. Its computing speed bears comparison with that of large scale computer, so it is possible to run critical and radiation shielding analysis codes with reasonably acceptable time. Thus, installation and demonstration of the running time of critical and radiation shielding analysis codes dose not only make parametric case studies easy, but also might facilitate the installation of the same scale codes to EWS on other fields, and therefore might relief loads of large scale computers. On this work, critical and radiation shielding analysis codes such as MAIL3, ANISN, TWOTRAN, KENO-IV, CITATION, VIM, DORT, and ORIGEN2, which are often used to by our studies, were converted to install and executed on EWS SUN-4/2. At the same time, the submit command was made to enable arbitrary specification of I/O access files. (author).

27870 (JINR-E–13-92-316) **Proposal of a wide-band mirror polarizer of slow neutrons at a pulsed neutron source.** Nikitenko, Yu.V.; Ostanevich, Yu.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1992. [10p.] Order Number DE93630059. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nucl. Instrum. Methods.

The new type wide-band mirror-based neutron polarizer to be operated at a pulsed neutron source is suggested. The idea is to use a movable polarizing mirror system, which, be the incoming beam monochromatized by the time-of-flight, would allow one to tune glancing angles in time so, that the total reflection condition is always fulfilled only for one of the two neutron spin eigenstates. Estimates show, that with the pulsed reactor IBR-2 such polarizer allows one to build a small-angle neutron scattering instrument capable to effectively use the wave-length band from 2 to 15 A. 9 refs.; 1 fig.

27871 (LA-UR–93-1216) **The LAHET code system: Introduction, development, and benchmarking.** Prael, R.E. Los Alamos National Lab., NM (United States). [1993]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930168–6: Simulating accelerator radiation environments workshop, Santa Fe, NM (United States), 11-15 Jan 1993). Order Number DE93012657. Source: OSTI; NTIS; GPO Dep.

An introduction to the LAHET code system is presented, showing the function of each code and their interrelation. A summary is made of the principal physics models used in LAHET. Some recent results in benchmarking axe shown for small-angle neutron emission from ^{7}Li for 800 MeV protons incident, neutron emission from ^{9}Be at several incident proton energies, and actinide and subactinide fission ratios.

27872 (LA-UR–93-1446) **A new method to assess Monte Carlo convergence.** Forster, R.A.; Booth, T.E.; Pederson, S.P. Los Alamos National Lab., NM (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304131–3: Advanced Monte Carlo computer programs for radiation transport, Saclay (France), 27-29 Apr 1993). Order Number DE93012667. Source: OSTI; NTIS; GPO Dep.

The central limit theorem can be applied to a Monte Carlo solution if the following two requirements are satisfied: (1) the random

variable has a finite mean and a finite variance; and (2) the number N of independent observations grows large. When these are satisfied, a confidence interval based on the normal distribution with a specified coverage probability can be formed. The first requirement is generally satisfied by the knowledge of the type of Monte Carlo tally being used. The Monte Carlo practitioner has only a limited number of marginally quantifiable methods that use sampled values to assess the fulfillment of the second requirement; e.g., statistical error reduction proportional to $1/\sqrt{N}$ with error magnitude guidelines. No consideration is given to what has not yet been sampled. A new method is presented here to assess the convergence of Monte Carlo solutions by analyzing the shape of the empirical probability density function (PDF) of history scores, f(x), where the random variable x is the score from one particle history and $\int_{-\infty}^{\infty} f(x)\,dx = 1$. Since f(x) is seldom known explicitly, Monte Carlo particle random walks sample f(x) implicitly. Unless there is a largest possible history score, the empirical f(x) must eventually decrease more steeply than $1/x^3$ for the second moment ($\int_{-\infty}^{\infty} x^2 f(x)\,dx$) to exist.

27873 (LA-UR–93-1475) **MCNP4A: Features and philosophy.** Hendricks, J.S. Los Alamos National Lab., NM (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304137–1: Centre d'Etudes meeting, Saclay (France), 27-29 Apr 1993). Order Number DE93012749. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes MCNP, states its philosophy, introduces a number of new features becoming available with version MCNP4A, and answers a number of questions asked by participants in the workshop. MCNP is a general-purpose three-dimensional neutron, photon and electron transport code. Its philosophy is "Quality, Value and New Features." Quality is exemplified by new software quality assurance practices and a program of benchmarking against experiments. Value includes a strong emphasis on documentation and code portability. New features are the third priority. MCNP4A is now available at Los Alamos. New features in MCNP4A include enhanced statistical analysis, distributed processor multitasking, new photon libraries, ENDF/B-VI capabilities, X-Windows graphics, dynamic memory allocation, expanded criticality output, periodic boundaries, plotting of particle tracks via SABRINA, and many other improvements. 23 refs.

27874 (LA-UR–93-1922) **Application of a simple analytical model to estimate effectiveness of radiation shielding for neutrons.** Frankle, S.C.; Fitzgerald, D.H.; Hutson, R.L.; Macek, R.J.; Wilkinson, C.A. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–52: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014456. Source: OSTI; NTIS; INIS; GPO Dep.

Neutron dose equivalent rates have been measured for 800-MeV proton beam spills at the Los Alamos Meson Physics Facility. Neutron detectors were used to measure the neutron dose levels at a number of locations for each beam-spill test, and neutron energy spectra were measured for several beam-spill tests. Estimates of expected levels for various detector locations were made using a simple analytical model developed for 800-MeV proton beam spills. A comparison of measurements and model estimates indicates that the model is reasonably accurate in estimating the neutron dose equivalent rate for simple shielding geometries. The model fails for more complicated shielding geometries, where indirect contributions to the dose equivalent rate can dominate.

27875 (LA-UR–93-1925) **Monte Carlo based formula for radiation shielding assessment in the forward direction.** Wilkinson, C.A.; Fitzgerald, D.H.; Frankle, S.C.; Hutson, R.L.; Macek, R.J. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–50: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014454. Source: OSTI; NTIS; INIS; GPO Dep.

Monte Carlo simulations of 800-MeV proton beam spills in common shielding materials show that neutron dose equivalent rates in the forward direction can be characterized by a Moyer Model-like formula. Particle transport codes were used to determine the neutron flux at depths up to 6 meters and for production angles from 0° to 30° for primary proton beam spills on cylindrical beam stops. The flux was then converted to dose equivalent rate as a function of depth and angle. The results for three common shielding materials were combined and the resulting fitted formula provides a quick method for estimating the dose equivalent rates and shielding effectiveness outside thick shielding at forward angles.

27876 (LBL–33429) **EGS_Windows2: An enhanced graphical interface to EGS.** Chatterjee, S. (California Univ., Berkeley, CA (United States). Dept. of Electrical Engineering and Computer Science); Donahue, R.J. Lawrence Berkeley Lab., CA (United States). 7 Jan 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9302113–1: International conference on Monte Carlo simulation in nuclear and high energy physics, Tallahassee, FL (United States), 22-26 Feb 1993). Order Number DE93010447. Source: OSTI; NTIS; GPO Dep.

This report gives a general overview of the EGS_Windows2 program. The program is intended to be used to display individual particle histories of electrons, photons, and positrons generated by the EGS4 Code System. Much of this work is based on the earlier version of EGS_Windows2 from the Institute for National Measurement Standards at the National Research Council of Canada (NRCC). No attempt is made to modify their EGS subroutine WATCH, which is used to output the particle vectors to be read by EGS-Windows, or duplicate any of the documentation describing the subroutine. EGS_Windows2 reads data in the same format as produced by WATCH. Users of EGS_Windows2 are encouraged to obtain the original EGS_Windows report from the NRCC in addition to this report as complete documentation of EGS_Windows2. As in the original report, two levels of information are covered in this report: the user level, and the programmer level. The user level should be read by all users. It describes execution, operation, and capabilities. The programmer level should be read by those users who may want to modify the program or who would like a more detailed understanding. It describes briefly the routines and there function, as well as the major changes in the new release of the 3D graphics programming library Sun PHIGS 2.0.

27877 (SAND–93-0482C) **Variance reduction unique to coupled electron/photon Monte Carlo transport.** Halbleib, J.A.; Kensek, R.P.; Valdez, G.D. Sandia National Labs., Albuquerque, NM (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9304131–5: Advanced Monte Carlo computer programs for radiation transport, Saclay (France), 27-29 Apr 1993). Order Number DE93014999. Source: OSTI; NTIS; INIS; GPO Dep.

The disparity between the mean free paths of electrons and photons leads to unique variance-reduction procedures for the coupled transport at intermediate energies. It is electrons that ultimately deposit charge and energy, yet electron transport is much more expensive than photon transport. The objective, then, is to control the variance of the energy, angular, and spatially dependent populations of the two species within the generation and transport of the cascade in such a way that all contributions to electron flux in the vicinity of the detector are represented to a degree commensurate with their importance. However, in β/γ transport, biasing techniques are often unique to one or the other of the species.

27878 (SAND–93-1010C) **ITS Version 3.0: The Integrated TIGER Series of coupled electron/photon Monte Carlo transport codes.** Halbleib, J.A. (Sandia National Labs., Albuquerque, NM (United States)); Kensek, R.P.; Valdez, G.D.; Mehlhorn, T.A.; Seltzer, S.M.; Berger, M.J. Sandia National Labs., Albuquerque, NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9304131–6: Advanced Monte Carlo computer programs for radiation transport, Saclay (France), 27-29 Apr 1993). Order Number DE93015015. Source: OSTI; NTIS; INIS; GPO Dep.

ITS is a powerful and user-friendly software package permitting state-of-the-art Monte Carlo solution of linear time-independent coupled electron/photon radiation transport problems, with or without the presence of macroscopic electric and magnetic fields. It

combines operational simplicity and physical accuracy in order to provide experimentalists and theorists alike with a method for the routine but rigorous solution of sophisticated radiation transport problems. Flexibility of construction permits tailoring of the codes to specific applications and extension of code capabilities to more complex applications through simple update procedures.

6640 Atomic and Molecular Physics

27879 (PNL–8642) **Theory, modeling, and simulation annual report, 1992.** Pacific Northwest Lab., Richland, WA (United States). May 1993. 103p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93015607. Source: OSTI; NTIS; GPO Dep.

This report briefly discusses research on the following topics: development of electronic structure methods; modeling molecular processes in clusters; modeling molecular processes in solution; modeling molecular processes in separations chemistry; modeling interfacial molecular processes; modeling molecular processes in the atmosphere; methods for periodic calculations on solids; chemistry and physics of minerals; graphical user interfaces for computational chemistry codes; visualization and analysis of molecular simulations; integrated computational chemistry environment; and benchmark computations.

27880 (ANL/PHY/CP–79637) **Resonant x-ray Raman scattering from atoms and molecules.** Cowan, P.L. Argonne National Lab., IL (United States). [1992]. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9208186–3: International conference on anomalous scattering (ICAS) conference, Hamburg (Germany), 17-21 Aug 1992). Order Number DE93015158. Source: OSTI; NTIS; INIS; GPO Dep.

Inelastic x-ray scattering and elastic x-ray scattering are fundamentally related processes. When the x-ray photon energy is near the ionization threshold for an inner shell, the inelastic channel is dominated by resonant x-ray Raman scattering. Studies of this emission not only illuminate the resonant scattering process in general, they also point to new opportunities for spectral studies of electronic structure using x-rays. Atoms in the form of a free gas provide an ideal target for testing the current theoretical understanding of resonant x-ray Raman scattering. In addition, x-ray scattering from molecular gases demonstrates the effect of bonding symmetry on the polarization and angular distribution of the scattered x-rays. Comparisons of experimental data with theory demonstrate both the successes and limitations of simple, single-electron interpretations of the scattering process.

27881 (CONF-9101167–1) **Towards spectroscopy of partially coherent sources.** Wolf, E. (Rochester Univ., NY (United States)). Rochester Univ., NY (United States). Dept. of Physics and Astronomy. [1991]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER14119. From International conference on quantum optics; Hyderabad (India); 5-10 Jan 1991. Order Number DE93013438. Source: OSTI; NTIS; INIS; GPO Dep.

Traditional spectroscopy is concerned with spatially incoherent sources. In relatively recent times, after the invention of the lasers in 1960, spectroscopy of coherent sources has also been gradually developed. In the last few years it was found that spectroscopy of partially coherent sources i.e., those which are neither completely uncorrelated nor fully correlated, encounters certain problems. They arise from the fact predicted theoretically in 1986 and confirmed experimentally soon afterwards that, in general, the spectrum of light generated by a partially coherent source changes on propagation, even in free space. Such changes may take many different forms. For example a spectral line may be shifted or distorted or it may be split into several lines. In this talk the basic physical principles underlying this phenomenon will be described and some recent developments in this field will be reviewed.

27882 (DOE/ER/13960–5) **New infrared photon absorption processes: Final technical progress report, August 1, 1988–February 1, 1993.** Bayfield, J.E. Pittsburgh Univ., PA (United States). May 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER13960. Order Number DE93017017. Source: OSTI; NTIS; INIS; GPO Dep.

The fast ionization of atoms by very short laser pulses, and its possible suppression at extreme pulse intensities, is an active new field of investigation at present. Described is an investigation of whether past techniques for infrared laser multiphoton ionization of excited hydrogen atoms and of one-dimensional microwave ionization of highly excited hydrogen atoms can be combined and extended to address the new issues. Although technically difficult and requiring further improvement of apparatus, intense-field infrared laser experiments on excited hydrogen atoms are possible and can directly test theoretical and numerical results.

27883 (DOE/ER/45415–6) **Recent developments in multiple-scattering calculations of XAFS and XANES.** Rehr, J.J. Washington Univ., Seattle, WA (United States). Dept. of Physics. [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER45415. (CONF-9208160–7: 7. international conference on x-ray absorption fine structure, Kobe (Japan), 23-29 Aug 1992). Order Number DE93010999. Source: OSTI; NTIS; INIS; GPO Dep.

Curved-wave multiple-scattering (MS) theory provides a unified treatment of XAFS, encompassing both EXAFS and XANES, as well as a formal equivalence between exact treatments and the (MS) expansion carried to all orders. Recent developments in the theory of XAFS are reviewed with an emphasis on progress in curved-wave MS calculations and on understanding the nature of MS contributions in EXAFS and XANES. In particular, a unified ab initio MS treatment of XAFS is discussed based on a scattering matrix formalism which has sufficient speed and accuracy to treat high-order MS in extended systems. Neither low-order MS nor full MS theories are fully satisfactory. Instead, sufficiently high-order MS appears to be necessary for the convergence of both EXAFS and XANES calculations. The approach also gives a MS interpretation of the σ^* shape-resonances observed in XANES. It is shown that these peaks result from coherent, high-order MS. A generalization of the Natoli rule correlating the resonance locations with bond length is obtained.

27884 (UCRL-JC–112624) **High-order harmonic generation with short-pulse lasers.** Schafer, K.J.; Krause, J.L.; Kulander, K.C. Lawrence Livermore National Lab., CA (United States). Dec 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930159–43: OE/LASE '93: International Society for Optical Engineering (SPIE) conference, Los Angeles, CA (United States), 16-23 Jan 1993). Order Number DE93016532. Source: OSTI; NTIS; INIS; GPO Dep.

Recent progress in the understanding of high-order harmonic conversion from atoms and ions exposed to high-intensity, short-pulse optical lasers is reviewed. We find that ions can produce harmonics comparable in strength to those obtained from neutral atoms, and that the emission extends to much higher order. Simple scaling laws for the strength of the harmonic emission and the maximium observable harmonic are suggested. These results imply that the photoemission observed in recent experiments in helium and neon contains contributions from ions as well as neutrals.

27885 (UCRL-JC–113498) **Analysis of neon soft x-ray spectra from short-pulse laser-produced plasmas.** Abare, A.C. (Florida Univ., Gainesville, FL (United States)); Keane, C.J.; Crane, J.K.; DaSilva, L.B.; Lee, R.W.; Perry, M.D.; Falcone, R.W. Lawrence Livermore National Lab., CA (United States). Apr 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930159–36: OE/LASE '93: International Society for Optical Engineering (SPIE) conference, Los Angeles, CA (United States), 16-23 Jan 1993). Order Number DE93014420. Source: OSTI; NTIS; INIS; GPO Dep.

We report preliminary results from the analysis of streaked soft x-ray neon spectra a gas jet target. In obtained from the interaction of a picosecond Nd:glass laser with these experiments streaked spectra show prompt harmonic emission followed by longer time duration soft x-ray line emission. The majority of the line emission observed was found to originate from Li- and Be-like Ne and the major transitions in the observed spectra have been identified. Li-like emission lines were observed to decay faster in time than Be-like transitions, suggesting that recombination is taking place. Line ratios of n=4-2 and n=3-2 transitions supported the view that these lines were optically thin and thick, respectively. The time history of Li-like Ne 2p-4d and 2p-3d lines is in good agreement with a simple adiabatic expansion model coupled to a time dependent collisional-radiative code. Further x-ray spectroscopic analysis is underway which is aimed at diagnosing plasma conditions and assessing the potential of this recombining neon plasma as a quasi-steady-state recombination x-ray laser medium.

27886 (BNL–48218) **Stripping efficiencies for 277 MeV/amu gold beam on copper foils.** Roser, T. Brookhaven National Lab., Upton, NY (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–129: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014306. Source: OSTI; NTIS; INIS; GPO Dep.

Stripping efficiencies were measured for 277 MeV/amu Au_{33+} ions with Copper foils ranging in thickness from 25μm to 100μm. The charge state distribution was analyzed using the beam line magnets of the transfer line between the AGS Booster and the AGS at Brookhaven. The relative charge state abundances were analyzed to find the optimum foil thicknesses for fully stripped Au^{79+} and Helium-like Au^{77+}. It was also possible to extract electron stripping and pick-up cross sections.

27887 (DOE/ER/13745–3) **Metastable enhancement of C^+ and O^+ capture reactions: Final report.** Thomas, E.W. Georgia Inst. of Tech., Atlanta, GA (United States). School of Physics. 31 Jul 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER13745. Order Number DE93015075. Source: OSTI; NTIS; INIS; GPO Dep.

The project is devoted to the study of charge transfer neutralization of Carbon and oxygen ions in H and H_2 gases at energies from 10 to 500 eV. A major motivation was to provide cross section data to support analysis of edge plasmas in Tokamak Fusion devices. The first objective was to measure cross sections for metastable excited singly charged ions separately from the cross sections for ground state ions. Previously published values are confusing because the beams used included unknown fractions of metastables and these metastables have cross sections greatly different from the ground states. The program was fully accomplished, metastable cross sections were found to be over an order of magnitude greater than ones for the ground state and existing discrepancies in the literature were resolved. Considerable effort was devoted to the design and operation of ion source configurations were the metastable content of the ion beam was known. Subsequently study progressed to the neutralization of multiply charged C and 0 ions in the same targets. First there has been a need to develop ion sources which can produce useful beams of multiply charged species. This has now been accomplished. The intent is to use these sources for the measurement of cross sections with again an attempt to differentiate between the behavior of ground and metastably excited species.

Submitted to Z. Phys., D.

Total, excitation and ionization cross section of the Coulomb bound state of two elementary particles (elementary atoms) interacting with atoms of H, C, N, Ar and Ta are calculated. Elementary atoms in the initial states 1s, 2s and 3s consisting of $\pi^+\pi^-$, $\pi\mu$, πK and e^+e^- pairs are studied. Exact analytic formulas for a large number of elementary atom form factors for discrete-discrete level transitions are given. 21 refs.; 18 tabs.

Watson Research Center); Sobehart, J.R. Los Alamos National Lab., NM (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9309185–1: Fluctuations and order: the new synthesis workshop, Los Alamos, NM (United States), 9-12 Sep 1993). Order Number DE93016612. Source: OSTI; NTIS; INIS; GPO Dep.

We finalize the dynamics of confined ions driven by a quantized radiation field. The ions can absorb photons from an incident laser beam and relax back to the ground state by either induced emissions or spontaneous emissions. Here we assume that the absorption of photons is immediately followed by spontaneous emissions, resulting in single-level ions perturbed by the exchange of momentum with the radiation field. The probability distribution of the ions is calculated using singular expansions in the low noise asymptotic limit. The present calculations reproduce the quantum results in the limit of heavy particles in static traps, and the classical results of ions in radio-frequency confining wells.

27891 (NEI-DK–1154) **Electron-ion recombination at low energy.** Andersen, L.H. Aarhus Univ. (Denmark). Naturvidenskabeligt Fakultet. 1993. [96p.] Order Number DE93631920. Source: OSTI; NTIS; INIS.

The work is based on results obtained with a merged-beams experiment. A beam of electronics with a well characterized density and energy distribution was merged with a fast, monoenergetic ion beam. Results have been obtained for radiative recombination and dielectronic recombination at low relative energies (0 to ≈70eV). The obtained energy resolution was improved by about a factor of 30. High vacuum technology was used to suppress interactions with electrons from the environments. The velocity distribution of the electron beam was determined. State-selective dielectronic-recombination measurements were performable. Recombination processes were studied. The theoretical background for radiative recombination and Kramers' theory are reviewed. The quantum mechanical result and its relation to the semiclassical theory is discussed. Radiative recombination was also measured with several different non-bare ions, and the applicability of the semiclassical theory to non-bare ions was investigated. The use of an effective charge is discussed. For dielectronic recombination, the standard theoretical approach in the isolated resonance and independent-processes approximation is debated. The applicability of this method was tested. The theory was able to reproduce most of the experimental data except when the recombination process was sensitive to couplings between different electronic configurations. The influence of external perturbing electrostatic fields is discussed. (AB) (31 refs.).

Following our previous compilations [IPPJ-AM-45 (1986), NIFS-DATA-7 (1990)], bibliographic information on experimental and theoretical studies on electron transfer processes in ion-ion/atom/molecule collisions is up-dated. The references published through 1980-1992 are included. For easy finding references for particular combination of collision partners, a simple list is also provided. (author) 1542 refs.

27893 (UCRL-JC–111717) **Indirect processes in electron impact ionization of Kr^{24+} and Kr^{25+}.** Chen, M.H.; Reed, K.J. Lawrence Livermore National Lab., CA (United States). Sep 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920948–13: 6. international conference on physics of highly charged ions, Manhattan, KS (United States), 28 Sep - 2 oct 1992). Order Number DE93014129. Source: OSTI; NTIS; INIS; GPO Dep.

Electron-impact ionization cross sections have been calculated for magnesiumlike Kr^{24+} and sodiumlike Kr^{25+}. Electron-impact ionization is an important atomic process in hot dense plasmas. It can affect the ionization balance, electron temperature, electron density, and level population in the plasma. In the past decade, theoretical and experimental studies have revealed that indirect processes can make significant contributions to the cross sections for electron impact ionization of positive ions. The most important indirect process is excitation of an inner-shell electron followed by Auger emission. Higher-order processes such as resonant excitation followed by sequential double Auger emission, can also contribute significantly. The contributions of excitation-autoionization and resonant excitation double autoionization (REDA) were included, in addition to the cross sections for direct ionization of a 3s electron. The calculations were carried out using the relativistic distorted wave methods and the multiconfiguration Dirac-Fock model. For Kr^{25+}, the total cross section is about 5 times the direct ionization cross section. For the Kr^{24+}, the indirect contribution is about 2.5 times the direct ionization cross section. The REDA process produces many strong resonances and contributes about 20% to the average ionization cross section.

DOE Contract W-7405-ENG-48. (CONF-930159–45: OE/LASE '93: International Society for Optical Engineering (SPIE) conference, Los Angeles, CA (United States), 16-23 Jan 1993). Order Number DE93017174. Source: OSTI; NTIS; GPO Dep.

The authors have measured the ion yields for helium and neon ionized by 120 femtosecond, 614 nanometer laser pulses with intensities up to 10^{16} watts per square centimeter. They have found that the He II and Ne II data exhibit features incompatible with standard nonresonant sequential ionization. These features reduce the usefulness of optical field ionization for monitoring laser intensity. For the experiment, they expect dynamic resonances to have little effect on the ionization, and they attribute the features to nonsequential ionization based on the simultaneous saturation of the features and the singly ionized charge states.

Submitted to Yad. Fiz.

The effective adiabatic approach to analysis of three-particle interaction is presented. It gives possibility to represent even in a simple two-level approximation all quality peculiarities of mesic atomic resonance reactions and to obtain good quantitative agreement with different cumbersome calculations. 15 refs.; 6 figs.

27897 (JINR-R–11-92-126) **The rise of accuracy for the multichannel scattering problem solving.** Vinitskij, S.I.; Puzynin, I.V.; Smirnov, Yu.S. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1992. [22p.] (In Russian). Order Number DE93630145. Source: OSTI; NTIS (US Sales Only); INIS.

The Newton's iterative algorithm for solving the multichannel scattering problem for a system of the Schroedinger radial equations is presented. A discrete approximation of the problem is based on the finite-difference scheme of the n-th order accuracy with respect to a characteristic step h of the quasi-uniform mesh Ω_h. The calculations of the wave functions, phase shifts and cross sections of elastic and inelastic collisions of mesic atoms $(d\mu)_{1s}$ and $(p\mu)_{1s}$ with nuclei t and p were fulfilled in framework of simple approach of two-level adiabatic approximation for the collision energy values 0.001 eV - 50 eV. As compared with other works more accurate results for the characteristics of the scattering processes $(d\mu)_{1s}$+t and $(t\mu)_{1s}$+d near thresholds in the region 0.001 eV $\leq E \leq$0.3 eV were obtained. A correct monotonic behaviour of the partial reaction matrix K^1 elements was achieved for this region of the energy and for values of the total orbital momentum 1=0, 1, 2, 3. 20 refs.; 8 figs.; 6 tabs.

The common theme of the research is the effects of electronic interactions on the properties of systems. Specifically, work was done in the following areas: magnetically modulated systems, Raman and EELS in superlattices, ballistic quantum interference effects, quantum dot arrays, and optical response of undoped fullerene crystals.

27899 (IC–93/80) **Ising model on tangled chain - 1: Free energy and entropy.** Mejdani, R. International Centre for Theoretical Physics, Trieste (Italy). Apr 1993. [15p.] Order Number DE93628792. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper we have considered an Ising model defined on tangled chain, in which more bonds have been added to those of pure Ising chain. to understand their competition, particularly between ferromagnetic and antiferromagnetic bonds, we have studied, using the transfer matrix method, some simple analytical calculations and an iterative algorithm, the behaviour of the free energy and entropy, particularly in the zero-field and zero temperature limit, for different configurations of the ferromagnetic tangled chain and different types of addition interaction (ferromagnetic or antiferromagnetic). We found that the condition J=J' between the ferromagnetic interaction J along the chain and the antiferromagnetic interaction J' across the chain is somewhat as a "transition-region" condition for this behaviour. Our results indicate also the existence of non-zero entropy at zero temperature. (author). 17 refs, 8 figs.

27900 (IC–93/86) **Electron paramagnetic resonance of the ns^1 centers in crystals.** Nistor, S.V. (Antwerp Univ. (UIA), Wilrijk-Antwerpen (Belgium). Physics Dept.); Ursu, I. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [49p.] Order Number DE93628793. Source: OSTI; NTIS (US Sales Only); INIS.

The results of the EPR studies concerning the paramagnetic centers with ns^1 (N=n>2) outer electronic configuration contained in crystals are reviewed. Such centers, with $^2S_{1/2}$ ground state, are produced by electron trapping at impurities of the IB and IIB group or by hole trapping at impurities of the IIIB and IV group of elements. The production and structural properties of such centers consisting of ns^1 ions (atoms) at various sites in the crystal lattice with different configurations of neighbouring defects are discussed in connection with their EPR characteristics. Tables containing the spin Hamiltonian parameters of all ns^1 centers reported in the literature until the end of year 1992 are given. (author). 146 refs, 14 tabs.

27901 (IC–93/90) **Ising model on tangled chain - 2: Magnetization and susceptibility.** Mejdani, R. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [21p.] Order Number DE93628794. Source: OSTI; NTIS (US Sales Only); INIS.

In the preceding paper we have considered an Ising model defined on tangled chain to study the behaviour of the free energy and entropy, particularly in the zero-field and zero-temperature limit. In this paper, following the main line and basing on some results of the previous work, we shall study in the "language" of state configurations the behaviour of the magnetization and the susceptibility for different conditions of the model, to understand better the competition between the ferromagnetic bonds along the chain and the antiferromagnetic additional bonds across the chain. Particularly interesting is the behaviour of the susceptibility in the zero-field and zero-temperature limit. Exact solutions for the magnetization and susceptibility, generated by analytical calculations and iterative algorithms, are described. The additional bonds, introduced as a form of perfectly disorder, indicate a particular effect on the spin correlation. We found that the condition J=-J' between the ferromagnetic interaction J along the chain and the antiferromagnetic interaction J' across the chain is somewhat as a "transition-region" condition for this behaviour. (author). 16 refs, 14 figs.

27902 (IC–93/114) **Crystal anharmonicity in Li(H,D) and Na(H,D) systems.** Islam, A.K.M.A. (International Centre for Theoretical Physics, Trieste (Italy)); Haque, E.; Azad, A.S. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [18p.] Order Number DE93632043. Source: OSTI; NTIS (US Sales Only); INIS.

The reliability of our recently developed potential model is tested by extending the study to various anharmonic properties, e.g., third order elastic constants, fourth order elastic constants, Grueneisen parameters, and the pressure derivatives of second order elastic constants of hydrides and deuterides of lithium and sodium. A comparison of the calculated properties with the available experimental results and other theoretical estimates shows the validity and reliability of the derived potential in the study of crystal anharmonicities also. (author). 43 refs, 2 figs, 4 tabs.

Source: OSTI; NTIS; GPO Dep.

An overview is presented of research that focuses on slow flows of suspensions in which colloidal and inertial effects are negligibly small. We describe nuclear magnetic resonance imaging experiments to quantitatively measure particle migration occurring in concentrated suspensions undergoing a flow with a nonuniform shear rate. These experiments address the issue of how the flow field affects the microstructure of suspensions. In order to understand the local viscosity in a suspension with such a flow-induced, spatially varying concentration, one must know how the viscosity of a homogeneous suspension depends on such variables as solids concentration and particle orientation. We suggest the technique of falling ball viscometry, using small balls, as a method to determine the effective viscosity of a suspension without affecting the original microstructure significantly. We also describe data from experiments in which the detailed fluctuations of a falling ball's velocity indicate the noncontinuum nature of the suspension and may lead to more insights into the effects of suspension microstructure on macroscopic properties. Finally, we briefly describe other experiments that can be performed in quiescent suspensions (in contrast to the use of conventional shear rotational viscometers) in order to learn more about boundary effects in concentrated suspensions.

27904 (RISO-R–660(EN)) **Annual progress report of the Department of Solid State Physics 1. January - 31 December 1992.** Skov Pedersen, J.; Lebech, B.; Lindgaard, P.-A. (eds.). Risoe National Lab., Roskilde (Denmark). Solid State Physics Dept. Jan 1993. [164p.] Order Number DE93630213. Source: OSTI; NTIS; INIS.

Research in the department is in the field of condensed matter physics. The principal activities of the department in the period from 1 january, to 31 December, 1992, are presented in this Progress Report. The department's research is predominantly experimental - utilising diffraction of neutrons and X-rays - and includes studies of two- and three-dimensional structures, magnetic ordering, heavy fermions, high T_c superconductivity, phase transitions in model systems, precipitation phenomena, and nano-scale structures in various materials. The major interest of the department is in basic research but projects of a more applied nature are often up, prompted by the applicability of the developed techniques and expertise. For clarity, the contributions to this report are organized into 12 categories with the following headings: Theory, Monte Carlo simulations, and methods for data analysis. Magnetic structures, magnetic phase transitions,and spin dynamics. High T_c superconductivity. Structures and structural phase transitions. Inclusions and precipitates in alloys and metals. Interaction of particles and photons with surfaces. Surfaces, interfaces, and amorphous structures. Langmuir films. Polymers. Microemulsions and biological systems. Instrumental developments. Other activities. (au) (1 tab., 101 ills., 165 refs.).

27905 (UCRL-JC–110945) **Volume dependence of Anderson hybridization in cubic CeCd and CeAg.** Monachesi, P. (L'Aquila Univ. (Italy). Dipt. di Fisica); Continenza, A.; Andreani, L.C.; McMahan, A.K. Lawrence Livermore National Lab., CA (United States). Sep 1992. 13p. Sponsored by USDOE, Washington, DC (United States); Swiss National Science Foundation, Bern (Switzerland); Consiglio Nazionale delle Ricerche, Rome (Italy). DOE Contract W-7405-ENG-48. (CONF-921201–16: 37. annual conference on magnetism and magnetic materials, Houston, TX (United States), 1-4 Dec 1992). Order Number DE93013081. Source: OSTI; NTIS; GPO Dep.

We have undertaken a first-principles theoretical study of the Anderson hybridization in cubic CeCd and CeAg as a function of volume reduction. We present results for the hybridization width $\Delta(\epsilon)$ in both the J = 5/2 multiplet and in the Γ_8, Γ_7 crystal field states of the f^1 Ce configuration. We also calculate the hybridization contribution to the magnetic transition temperature. This is found to increase with pressure but is smaller than the experimental values, indicating that the Coulomb exchange contribution to the magnetic coupling is not negligible in these compounds.

27906 (UCRL-JC–112287) **Numerical simulations and experiments on physics of high Mach number shockwave – turbulent flow interactions.** Buckingham, A.C. (Lawrence Livermore National Lab., CA (United States)); Grun, J. Lawrence Livermore National Lab., CA (United States). Dec 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9303126–3: 4. international workshop on the physics of compressible turbulent mixing, Cambridge (United Kingdom), 29 Mar - 1 apr 1993). Order Number DE93013424. Source: OSTI; NTIS; GPO Dep.

When a shock moves into and interacts with an existing turbulent field, a substantial enhancement of the after-shock turbulent intensity and a simultaneous distortion and realignment of the tensor stress rate field and associated tensor stress field results. Component mixing, advective transport, and diffusion, as well as associated momentum and energy dissipation, are intensified over their pre-shocked levels. A combination of low preshocked turbulent

intensity and strong shocks (e.g. shock Mach numbers substantially greater than one) produces the most pronounced interactive change in the turbulence level. In contrast, when a weak shock (Mach number only slightly greater than one) moves through relatively intense up turbulence, the turbulence change is modest but dynamical distortion and erratic motion of the shock front is much more pronounced. It is a commonly held view that if the interactive shock Mach number is in the hypersonic range (shock Mach numbers equal to or greater than about 6), rapid reinforcement of shock strength at the front by non-linear pressure field interactions and consequent self-healing of shock front geometric irregularity would act to suppress front distortion and also suppress the influence of the shock interactions on the surrounding turbulence. In the present work, recent experiments, numerical large eddy simulations (LES), and analysis are presented which contradict this notion. This work suggests that pronounced shock front distortion and substantial interactive modification of the turbulence persists even for shocks propagating at shock Mach numbers well in excess of 100!

(CONF-920944–7: 6. annual New York State Institute on Superconductivity (NYSIS) conference on superconductivity and applications, Buffalo, NY (United States), 15-17 Sep 1992). Order Number DE93016218. Source: OSTI; NTIS; INIS; GPO Dep.

The local environment about oxygen atoms in $Pr_xY_{1-x}Ba_2Cu_3O_7$ films obtained by laser ablation has been investigated by means of the x-ray absorption fine structure (XAFS) spectroscopy at the O K-edge. It has been found that the Pr atoms do not substitute for the Cu atoms nor form interstitial defects in the CuO_2 planes and that the presence of Pr dopant does not disturb the local environment of oxygen.

27908 (BNL–48895) **Magnetic effects in anomalous dispersion.** Blume, M. Brookhaven National Lab., Upton, NY (United States). [1992]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9208186–2: International conference on anomalous scattering (ICAS), Hamburg (Germany), 17-21 Aug 1992). Order Number DE93014291. Source: OSTI; NTIS; INIS; GPO Dep.

Spectacular enhancements of magnetic x-ray scattering have been predicted and observed experimentally. These effects are the result of resonant phenomena closely related to anomalous dispersion, and they are strongest at near-edge resonances. The theory of these resonances will be developed with particular attention to the symmetry properties of the scatterer. While the phenomena to be discussed concern magnetic properties the transitions are electric dipole or electric quadrupole in character and represent a subset of the usual anomalous dispersion phenomena. The polarization dependence of the scattering is also considered, and the polarization dependence for magnetic effects is related to that for charge scattering and to Templeton type anisotropic polarization phenomena. It has been found that the strongest effects occur in rare-earths and in actinides for M shell edges. In addition to the scattering properties the theory is applicable to "forward scattering" properties such as the Faraday effect and circular dichroism.

27909 (DOE/ER/60721–6) **Quasi-elastic neutron scattering studies of protein dynamics: Progress report, November 1, 1992–May 25, 1993.** Rorschach, H.E. Rice Univ., Houston, TX (United States). Dept. of Physics. 25 May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER60721. Order Number DE93015074. Source: OSTI; NTIS; INIS; GPO Dep.

Results that shed new light on the study of protein dynamics were obtained by quasi-elastic neutron scattering. The triple axis instrument H-9 supplied by the cold source was used to perform a detailed study of the quasi-elastic spectrum and the Debye-Waller factor for trypsin in powder form, in solution, and in crystals. A preliminary study of myoglobin crystals was also done. A new way to view the results of quasi-elastic scattering experiments is sketched, and the data on trypsin are presented and analyze according to this new picture.

27910 (LBL–31852) **Applications of the Advanced Light Source to problems in the earth, soil, and environmental sciences report of the workshop.** Lawrence Berkeley Lab., CA (United States). Oct 1992. 130p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-911288–: Applications of the Advanced Light Source to problems in the earth, soil, and environmental sciences, San Francisco, CA (United States), 11 Dec 1991). Order Number DE93015258. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the following topics: ALS status and research opportunities; advanced light source applications to geological materials; applications in the soil and environmental sciences; x-ray microprobe analysis; potential applications of the ALS in soil and environmental sciences; and x-ray spectroscopy using soft x-rays: applications to earth materials.

27911 (LBL–34118) **Strain distribution in heterolayers with low misfit as revealed by convergent beam illumination methods.** Liliental-Weber, Z. (Lawrence Berkeley Lab., CA (United States)); Kaneyama, T.; Terauchi, M.; Tanaka, M. Lawrence Berkeley Lab., CA (United States). Nov 1992. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC03-76SF00098. Contract AFOSR-ISSA-90-0009. (CONF-921101–128: 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting, Boston, MA (United States), 30 Nov - 5 dec 1992). Order Number DE93015043. Source: OSTI; NTIS; GPO Dep.

Convergent beam electron diffraction (CBED) was applied to the local measurement of lattice parameter across a strained interface with small mismatch. GaAs layers grown at low temperature with excess As (with 0.15% misfit) on a GaAs substrate were chosen for these studies. Tetragonal distortion was detected in the layer up to 0.5 μm from the interface. With an increase of the layer thickness lowering of the symmetry of these CBED patterns was observed. This lowering of symmetry is most probably due to saturation of As solubility and the strain build into these layers.

27912 (SLAC–417) **Nuclear dynamical diffraction using synchrotron radiation.** Brown, D.E. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1993. 306p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (SLAC/SSRL–0027). Order Number DE93016172. Source: OSTI; NTIS; INIS; GPO Dep.

The scattering of synchrotron radiation by nuclei is extensively explored in this thesis. From the multipole electric field expansion resulting from time-dependent nonrelativistic perturbation theory, a dynamical scattering theory is constructed. This theory is shown, in the many particle limit, to be equivalent to the semi-classical approach where a quantum mechanical scattering amplitude is used in the Maxwell inhomogeneous wave equation. The Moessbauer specimen whose low-lying energy levels were probed is a ferromagnetic lattice of ^{57}Fe embedded in a yttrium iron garnet (YIG) crystal matrix. The hyperfine fields in YIG thin films were studied at low and room temperature using time-resolved quantum beat spectroscopy. Nuclear hyperfine structure quantum beats were measured using a fast plastic scintillator coincidence photodetector and associated electronics having a time resolution of 2.5 nsec. The variation of the quantum beat patterns near the Bragg [0 0 2] diffraction peak gave a Lamb-Moessbauer factor of 8.2 ± 0.4. Exploring characteristic dynamical features in the higher order YIG [0 0 10] reflection revealed that one of the YIG crystals had bifurcated into two different layers. The dynamics of nuclear superradiance was explored. This phenomenon includes the radiative speedup exhibited by a collective state of particles, and, in striking concurrence, resonance frequency shifts. A speedup of a factor of 4 in

the total decay rate and a beat frequency shift of $1\frac{1}{2}$ natural resonance linewidths were observed. Nuclear resonance scattering was also found to be a useful way of performing angular interferometry experiments, and it was used to observe the phase shift of a rotated quantum state. On the whole, nuclear dynamical diffraction theory has superbly explained many of the fascinating features of resonant magnetic dipole radiation scattered by a lattice of nuclei.

27913 (VTT-PUB–82) **Development and applications of the reverse neutron time-of-flight method with Fourier-type beam chopper.** Antson, O. (Technical Research Centre of Finland, Espoo (Finland). Reactor Lab.). Technical Research Centre of Finland, Espoo (Finland); Helsinki Univ. of Technology, Otaniemi (Finland). Sep 1991. [147p.] Order Number DE93630221. Source: OSTI; NTIS; INIS.

The thesis also includes seven previously published articles.

The neutron powder diffraction method has been applied to the crystal structure analysis of high-temperature superconductors such as $La_0.8Sr_0.2CuO_{4-\gamma}$, $YBa_2Cu_3O_{7-\gamma}$ and $Bi_2Sr_2CaCu_2O_{8+\gamma}$ optically active yttriumformate $Y(HCOO)_3$, and β phase of deuterated acetonitrile, CD_3CN. The structural information, containing symmetry, positional and thermal parameters, occupation factors and the order parameter, was obtained by measuring the coherent elastic scattering cross-section. The Rietveld profile refinement method was used for the extraction of structural parameters from experimental data. The diffraction spectra were obtained by measuring the time-of-flight distribution of neutrons with a Fourier-type beam chopper. The neutron diffraction spectrum is created by the on-line synthesis of the cross-correlation function between the beam modulation function and the detector intensity. Such an operational mode, called the reverse time-of-flight method, has many unique properties. The possibility of filtering out a low-frequency part of a diffraction spectrum, eg. incoherent background, by a properly selected band-pass filter has been studied. One of the practical applications of the reverse time-of-flight method, the Mini-Sfinks facility, is described with technical details, and its operational characteristics are compared with other high-resolution instruments.

27915 (IFVE-OP–91-142) **Crystal optics of high energy γ-beams: 3.Dielectric permeability tensor in single crystals at proton energy of $\geq$1 GeV.** Maisheev, V.A.; Mikhalev, V.L.; Frolov, A.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1991. [26p.] (In Russian). Order Number DE93630228. Source: OSTI; NTIS (US Sales Only); INIS.

Using the conception of the single crystal as a region of electrical field, generated by spatially ordered atoms, we have determined the tensor of dielectric permeability for $\geq$ 1 GeV photons in the region of crystal orientation, which corresponds to $^{\pm}$- pair coherent production. The polarization characteristics of normal EM wave propagation in the crystals were found with the help of this tensor. In particular, it was shown, that there exist solutions of a dispersion equation for elliptied polarized waves. Other EM processes in the crystals, in particular, Cherenkov radiation of charged particles, were considered. 18 refs.; 6 figs.

27916 (INIS-mf–13544, pp. 25-33) **Processes of high-energy electron interaction with oriented single crystals.** Antipenko, A.P. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Bochek, G.L.; Blazhevich, S.V. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

Interaction of relativistic electrons (0.3 to 1.75 GeV) with crystal targets has been investigated both by theory and in experiments in order to clarify the mechanisms of γ-ray generation and the characteristic properties of damages of single-crystal e - γ - converters. Measured are the integral energy fluxes and spectral-angular parameters of γ-radiation from oriented (<111> axis) silicon single crystals with thicknesses ranging from 10 to 70000 m. The highest γ-energy flux density is observed for a Si thickness of 15 mm. The brightness of γ-radiation from oriented crystal of optimum thickness varies with the electron energy according to the $\approx E^3$ law. The analysis of γ-quantum yields and the rate of radiation damaging as functions of a single crystal thickness has shown that the damaging of aligned single crystals at large depth is essentially contributed by the generated γ-ray fluxes. 11 refs.; 4 figs. (author).

27917 (INIS-mf–13544, pp. 42-46) **Investigation of positron interaction with defects of the molybdenum irradiated by fast neutrons.** Dubov, M.E. (Moskovskij Fiziko-Tekhnicheskij Inst., Moscow (Russian Federation)); Svirida, S.V.; Artemova, M.B.; Shishkin, A.V. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. Source: OSTI; NTIS (US Sales Only); INIS.

With the hope of the positron annihilation method the samples of the molybdenum monocrystals, irradiated by fast neutrons to the doze of $2.7x10^{19}$n/cm^2 are investigated. The irradiation was performed at 60^{0}C. At lower annealing temperatures we observed positrons saturation trapping by vacancies, dislocations and dislocation loops, while at high annealing temperatures - the dominant trapping by the voids take place. Basing on the results of the positron lifetime measurements as temperature we present the analysis of the influence of the sample dislocation structure on the positron annihilation parameters. 9 refs.; 1 fig.; 1 tab. (author).

27918 (INIS-mf–13544, pp. 70-75) **Investigation of proton-irradiated platinum by Moessbauer spectroscopy.** Bogdanov, V.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Zakurkin, V.V.; Petrov, D.V.; Pen'kov, Yu.P. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

The Moessbauer emission spectroscopy method has been applied to investigate the annealing of radiation damage in platinum (with the addition of ^{57}Co isotope) after irradiation with 1 MeV protons at 90 K to the dose of $5x10^{17}$cm^{-2}. The analysis of spectra evolution as a function of annealing temperature enabled four components to be highlighted alongside with the initial one that corresponds to the location of ^{57}Co atoms in a substitutional position of platinum lattice. From their thermal annealing character four "defect" sites are identified as followers: site 1 - as corresponding to the trapping at ^{57}Co probe atoms of hydrogen atoms, sites 2 and 3 - to the trapping of SIA-H complexes, and site 4 - to that of vacancy-H complexes. 10 refs.; 2 figs.; 1 tab. (author).

27919 (INIS-mf–13544, pp. 76-80) **Processes of primary radiation defect formation near dislocations and dislocation loops.** Gann, V.V. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Marchenko, I.G. AN Ukrainskoj SSR, Kharkov

(Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

The results of modelling calculations of dislocations and dislocation loops influence on formation and development of atom-atom collision chains are given. Processes of Frenkel pair formation are considered. An effect of "dynamic preference" was observed. 7 refs.; 3 figs. (J.P.).

27920 (INIS-mf–13544, pp. 47-54) **Hydrogen interaction with radiation defects of Fe and Mo.** Dubov, M.E. (Moskovskij Fiziko-Tekhnicheskij Inst., Moscow (Russian Federation)); Shishkin, A.V.; Artemova, M.B.; Svirida, S.V. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. Source: OSTI; NTIS (US Sales Only); INIS.

With the hope of the positron annihilation method the interaction of the hydrogen with the radiation defects of the iron and molybdenum samples, irradiated by fast neutrons are investigated. One stage of the hydrogen release in molybdenum and two in iron was observed during the annealing of the electrolytically charged samples. Hydrogen binding energies with the microvoids were calculated. On the base of the calculated positrons trapping rates the role of the dislocations as the hydrogen trapping centers are discussed. 8 refs.; 2 figs. (author).

27921 (INIS-mf–13544, pp. 134-141) **Atomistic computer simulation on interaction of point, linear and surface defects.** Bojko, V.S. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Mazilova, T.I.; Sidorenko, I.N. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij. Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

Results from computer simulation of interaction on atom level of point, linear and planar defects are analysed. Considered are: the behaviour of point defects in the step-containing dislocation core, annihilation of dislocations with opposite Burgers vectors, contact interaction between the dislocations having the same Burgers vectors and occurring in the adjacent slip planes, interaction of point defects (vacancies, He atoms) and their complexes with high-angle grain boundaries, interaction between dislocation cores and high-angle grain boundaries. Connection between the present results and the data from the experiment and the continuum theory is discussed. 21 refs.; 2 figs. (author).

27922 (INIS-mf–13544, pp. 142-149) **Use of median energy proton beams in radiation damage physics and in radiation material science.** Zelenskij, V.F. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Neklyudov, I.M.; Ozhigov, L.S. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

A mathematic modelling of radiation damages in steel, iron, chromium and nickel by 1-100 MeV protons and neutrons with energies covering the energy range of neutron spectra in existing and alternative nuclear installations was carried out. It indicates that proton beams with the energies up to 100 MeV can be used for imitation of material radiation damages by neutrons having different spectra and energies. 5 refs.; 7 figs.; 2 tabs. (J.P.).

27923 (INIS-mf–13546, pp. 38-45) **The modification of some steel properties under helium implantation.** Lysova, G.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Rudnev, S.I.; Panin, S.D.; Chernov, V.M.; Vishkarev, O.M.; Magerya, Yu.G.; Smirnov, V.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

Radiation microstructure, micro topography of surface and microhardness changes of surface layers of some steels were investigated after 30 keV helium ion irradiation to fluences of 10-40 dpa ($2\text{-}8x10^{17}$ ion/cm^2) at irradiation temperatures from 150^{0}C to 600^{0}C. 5 refs.; 4 figs.; 1 tab. (author).

27924 (INIS-mf–13546, pp. 98-105) **The creep of zirconium and Zr-1%Nb alloy under non-stationary irradiation by helium ions.** Bibilashvili, Yu.K. (Moskovskij Inzhenerno-Fizicheskij Inst., Moscow (Russian Federation)); Vasil'ev, V.K.; Elesin, V.F. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

The investigation of the creep of thin-sheet specimens of cold-worked zirconium and Zr-1% Nb alloy at one-axis loading and irradiation by helium ions is carried out. The differential measurement method being the basis of the test-installation construction allowed to observe the peculiarities connected with non-stationary conditions of the irradiation of the materials. The considerable post-irradiation deformation of specimens was detected the maximum rate of which can exceed the deformation rate under irradiation. The deformation value for unestablished post-irradiation-creep period depends on the value of total accumulated deformation. The results indicate a significant contribution of slipping into the deformation process. 9 refs.; 4 figs. (author).

27925 (JINR-E–14-92-178) **Deep ion implantation into manganin to modify its pressure and electrothermocharacteristics.** Wisniewski, R.; Slowinski, B. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1992. [2p.] Order Number DE93630229. Source: OSTI; NTIS (US Sales Only); INIS.

On the grounds of previously obtained experimental data concerning the high energy (≈1 MeV/u) Ar and Xe ions implantation into manganin, two suggestions to create the manganin based systems having improved pressure and electro-thermocharacteristics are put forward. The first way is to fabricate a multilayer system with the resultant plateau of the temperature dependence of the relative resistance much broader than the initial one. The second way comes to the formation of some manganin based selfcompensating structure. 4 refs.

27926 (PNL-SA–22200) **Electron emission resulting from fast ion impact on thin metal foils: Implications of these data for development of track structure models.** DuBois, R.D.; Drexler, C.G. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9304148–1: Department of Energy Monte Carlo workshop, Irving, CA (United States), 28-29 Apr 1993). Order Number DE93013506. Source: OSTI; NTIS; INIS; GPO Dep.

Experimental information useful in improving and testing theoretical models of energy deposition and redistribution in particle-condensed phase media is discussed. An overview of information available from previous, and ongoing, studies of the electron emission from thin foils is presented and the need for doubly differential electron energy and angular distribution data stressed. Existing data are used to demonstrate that precisely known, and controllable, surface and bulk conditions of the condensed-phase media are required for experimental studies of this type. Work in progress and improvements planned for future studies at the Pacific Northwest Laboratory are outlined.

27927 (SAND–93-0304C, pp. 3, Paper 1) **Interface roughness and x-ray reflectivity.** Slaughter, J.M.; Falco, C.M. Sandia National Labs., Albuquerque, NM (United States). [1993]. (CONF-921101–108: 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting, Boston, MA (United States), 30 Nov - 5 dec 1992). In *Interface roughness: What is it and how is it measured?.* 35p. Order Number DE93009797. Source: OSTI; NTIS.

Real multilayers have imperfect interfaces due to interdiffusion, faceting, or other imperfections. This presentation discusses how x-ray reflectivity may be used to assess the roughness of interfaces. An emphasis is placed on the geometry of x-ray interactions with matter.

27928 (UCRL-JC–112630) **The interaction of intense femtosecond laser pulses with solid targets.** Klem, D.E.; Darrow, C.; Lane, S.; Perry, M.D. Lawrence Livermore National Lab., CA (United States). 30 Dec 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9303119–3: 5. short wavelength: physics with intense laser pulses, San Diego, CA (United States), 29-31 Mar 1993). Order Number DE93014415. Source: OSTI; NTIS; GPO Dep.

The absorption of 800 fsec Nd-glass laser pulses obliquely incident on solid targets is measured at intensities up to 10^{18} W/cm^2. The associated production of hard x-rays is also measured.

27929 (UCRL-JC–113163) **Kinetic simulations of ultra-intense laser plasma interactions and a novel method of generating odd harmonics.** Wilks, S.C. (Lawrence Livermore National Lab., CA (United States)); Kruer, W.L.; Mori, W.B. Lawrence Livermore National Lab., CA (United States). 11 Feb 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930159–34: OE/LASE '93: International Society for Optical Engineering (SPIE) conference, Los Angeles, CA (United States), 16-23 Jan 1993). Order Number DE93014418. Source: OSTI; NTIS; GPO Dep.

We report on computer simulation results for a new laser plasma interaction regime, concentrating on the collisionless, kinetic nature of the plasma motion. It is found that even for normal incidence, the absorption of the laser light by the plasma electrons near critical can be as high as 60%, and that the temperature of the hot electrons produced can be predicted simply by knowing the associated ponderomotive potential of the incident laser. We also describe a new odd harmonic generation mechanism due to the interaction of the laser with the plasma electrons near critical.

27930 (ANL/MSD/CP–79586) **After seven years, where's the consensus?.** Norman, M.R. Argonne National Lab., IL (United States). Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930367–6: Conference on spectroscopies in novel superconductors, Santa Fe, NM (United States), 17-19 Mar 1993). Order Number DE93015160. Source: OSTI; NTIS; GPO Dep.

It has been 7 years since the discovery of copper oxide superconductors, yet there is no consensus on the correct theory for this phenomenon. The theory can be divided into 3 groups: ordinary (phonons), exotic (AF spin fluctuations, nested Fermi liquid, excitons, spin bags, odd frequency pairing), and revolutionary (Luttinger liquid, spin-charge separation, gauge theories, anyons, marginal Fermi liquid). C-axis dispersion, dHvA, and magneto-oscillations are also discussed.

27931 (CONF-930202–10) **Experimental investigations of superconductivity in quasi-two-dimensional epitaxial copper oxide superlattices and trilayers.** Lowndes, D.H.; Norton, D.P. Oak Ridge National Lab., TN (United States). [1993]. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Annual meeting of The Metallurgical Society; Denver, CO (United States); 21-25 Feb 1993. Order Number DE93015306. Source: OSTI; NTIS; INIS; GPO Dep.

Epitaxial trilayer and superlattice structures grown by pulsed laser ablation have been used to study the superconducting-to-normal transition of ultrathin (one and two c-axis unit cells) $YBa_2Cu_3O_{7-x}$ layers. The normalized flux-flow resistances for several epitaxial structures containing two-cell-thick $YBa_2Cu_3O_{7-x}$ films collapse onto the "universal" curve of the Ginzburg-Landau Coulomb Gas (GLCG) model. Analysis of normalized resistance data for a series of superlattices containing one-cell-thick $YBa_2Cu_3O_{7-x}$ layers also is consistent with the behavior expected for quasi-two-dimensional layers in a highly anisotropic, layered three-dimensional superconductor. Current-voltage measurements for one of the trilayer structures also are consistent with the normalized resistance data, and with the GLCG model. Scanning tunneling microscopy, transmission electron microscopy, and electrical transport studies show that growth-related steps in ultrathin $YBa_2Cu_3O_{7-x}$ layers affect electrical continuity over macroscopic distances, acting as weak links. However , the perturbation of the superconducting order parameter can be minimized by utilizing hole-doped buffer and cap layers, on both sides of the $YBa_2Cu_3O_{7-x}$ layer, in trilayers and superlattices. These results demonstrate the usefulness of epitaxial trilayer and superlattice structures as tools for systematic, fundamental studies of high-temperature superconductivity.

27932 (LA-UR–93-1384) **Effect of spontaneous decay of superconductor quasiparticles in the tunneling density of states.** Coffey, D. Los Alamos National Lab., NM (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930367–3: Conference on spectroscopies in novel superconductors, Santa Fe, NM (United States), 17-19 Mar 1993). Order Number DE93012681. Source: OSTI; NTIS; INIS; GPO Dep.

Superconductivity has been successfully described with either the Landau-Ginzburg theory of second order phase transitions or with strong-coupling versions of the original BCS theory for almost fifty years. Recent tunneling and photoemission data on the cuprate oxide superconductors may now provide evidence of corrections to the mean field approximation. It has been shown by Zasadzinski et al. that there is a dip at eV $\simeq 3\Delta_0$ in the SIS tunneling conductance, which is the derivative of the current across a superconductor-insulator-superconductor junction with respect to the applied voltage, for a set of cuprate superconductors whose T_c's range from 5.5K to 100K. Recently L. Coffey and I proposed an explanation of this feature in terms of the spontaneous decay of mean field quasiparticles. We showed that corrections to the mean field approximation for a superconductor lead to different frequency thresholds for spontaneous quasiparticle decay with different superconductor order parameter symmetries. These effects lead to features in the superconductor density of states and in the SIS tunneling conductance and provide experimental evidence of d-wave symmetry for the superconductor order parameter in the cuprates. I discuss model and also evidence of quasiparticle decay in ARPES data on $Bi_2Sr_2CaCu_2O_8$.

27933 (LA-UR–93-1736) **Muon spin relaxation studies of heavy fermion superconductors.** Heffner, R.H. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304145–2: International workshop on low energy muon science (LEMS '93), Santa Fe, NM (United States), 4-8 Apr 1993). Order Number DE93014576. Source: OSTI; NTIS; INIS; GPO Dep.

This talk will focus recent developments in our understanding of heavy fermion (HF) superconductors and the role that positive muon spin relaxation (μSR) studies have played in helping to elucidate their properties. As illustrations two systems will be discussed: (1) UPd_2Al_3, one of the most recently discovered HF superconductors, which also displays coexisting magnetic order and (2) UBe_3 doped with small quantities Of Th substituted for U, which displays an interplay between its superconducting and magnetic ground states, leading to multiple superconducting states.

in science, Bregenz (Austria), 2-7 Aug 1992). Order Number DE93010348. Source: OSTI; NTIS; INIS; GPO Dep.

The fractional quantum Hall effect is thought to be the result of correlations between electrons induced by their mutual interactions. This paper explores the consequences of these correlations numerically and analytically. The problem is mapped onto the surface of a sphere, so that the number of states in the first Landau level is finite. The following three sections review this geometry, give the matrix elements of the Coulomb interaction, and compare exact wave functions with the Laughlin/Haldane ground state ansatz for fractional fillings 1/m, m an odd integer. While this ansatz accounts for many of the J = 0 ground states found in numerical diagonalizations, it does not explain all such states. To make progress on this problem. A complete characterization of the most general four-particle J = 0 wave function is given, including an algebraic enumeration of the number of such states. This construction provides one example of a 2/3-filled state, the particle-hole conjugate of the 3-particle Laughlin/Haldane m = 3 state. This result suggests a generalization that may give the particle-hole conjugates of all Laughlin/Haldane states of arbitrary N: the construction depends on an equivalence of single-particle spinors of rank N/2 and ones formed by coupling the elementary spinors of N different particles. This result is further generalized to produce a wave function ansatz that may account for other fractional fillings of physical interest.

The scaling properties of edge fluctuations have been investigated using Langmuir probes in the edge region of the Advance Toroidal Facility (ATF). Fluctuations in the ion saturation current (I_s/I_s) and transport inferred from the fluctuations increase with increasing density gradient, while keeping unchanged local electron temperature. The modification of the electron temperature in the range (10-50) eV, Keeping constant the density profile, does not have any significant influence on I_s/I_s. In regions were $E_r/B \approx 0$, the poloidal phase velocity of the fluctuations is given by $V_p h \approx 2T_e L_n B$. More then one of any so far proposed mechanisms must be invoked to explain all the experimental observations.(Author)

27937 (CIEMAT–707) **A method for measuring plasma position in TJ-I Tokamak.** Quin, J.; TJ-I Team. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1993. 22p. Order Number DE93502572. Source: OSTI; NTIS.

A method using pairs of Mirnov coils to measure the plasma position in TJ-I is presented. The simple toroidal filament model which neglects the effect of plasma current density profile has proven to be acceptable within the experimental accuracy. The effect of plasma current density profile remains to be small, if the plasma current density profile has a quadratic form. (Author)

27938 (CIEMAT–709) **Experimental evidence of significant temperature fluctuations in the plasma edge region of the TJ-I Tokamak.** Hidalgo, C.; Balbin, R.; Pedrosa, M.A.; Garcia-Cortes, I.; Ochando, M.A. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1993. 14p. Order Number DE93502574. Source: OSTI; NTIS.

Density and temperature fluctuations have been measured in the plasma bulk side of the velocity shear location of the TJ-I tokamak using a foast swept Langmuir probe technique. Evidence of sustantial temperature fluctuations which are in phase close to opposition with the corresponding density fluctuations has been found. This result suggests the possible role of radiation in determining edge fluctuation levels and call into question the determination of the density and potential fluctuations from the Langmuir current-probe and floating potential fluctuations. (Author)

27939 (CIEMAT–710) **Characterization of He/CH_4 DC glow discharge plasmas by optical emission spectroscopy, mass spectrometry and actinometry.** De la Cal, E.; Tafalla, D.; Tabares, F.L. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1993. 27p. Order Number DE93502575. Source: OSTI; NTIS.

The gas-phase kinetics responsible for the formation of some electronically excited radicals (CH) and atoms (H,He;Ar) in glow discharge plasmas of He-methane admixtures has been investigated under several conditions of gas composition and discharge current at a total initial pressure of 0.01 torr. Actinometry has been used to characterize the microscopic plasma parameters and, in combination with mass spectrometry and optical emission spectroscopy, to establish the formation mechanism of excited species. Very good correlation between CH emission intensity and carbon deposition rate has been found under all conditions. The effective cracking Kinetic constant for methane molecular depends on plasma conditions, its value ranging from ≈ 1 to 5x10"-10 cm"3 s"-1 as plasma current is increased, in good agreement with the expected value according to the actinometric results. (Author)

27940 (CIEMAT–711) **Kinetics of Hydrocarbon formation in a-C:H film deposition plasmas.** De la Cal, E.; Tabares, F.L. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1993. 13p. Order Number DE93502576. Source: OSTI; NTIS.

The formation of C_2 and C_3 hydrocarbons during the PACVD of a-C-H films from admixtures of methane with H_2 and He has been investigated by mass espectrometry under several deposition condition. The time evolution of the observed species indicates that the formation mechanism of ethylene and acetylene are sensitive to the conditions of the wall during the growing of the film. Acetylene are sensitive to the conditions of the wall during the growing of the carburized metal. (Author)

27941 (CIEMAT–713) **Radial profile of the electron distribution from electron cyclotron emission measurements.** Tribaldos, V.; Krivenski, V. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1993. 21p. Order Number DE93502577. Source: OSTI; NTIS.

A numerical study is presented, showing the possibility to invert the electron distribution function from a small set of non-thermal spectra, for a regime of lower hybrid current drive. (Author)

27942 (CONF-921103–11-App.B) **Helium transport scaling law studies.** Guo, Junpeng; Miley, G.H. Illinois Univ., Urbana, IL (United States). Fusion Studies Lab. Nov 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER54092. From Meeting of the Division of Plasma Physics of the American Physical Society; Seattle, WA (United States); 16-20 Nov 1992. Order Number DE93013487. Source: OSTI; NTIS; INIS; GPO Dep.

Impurity behavior within the tokamak fusion plasma will be a main concern for the future tokamak operation such as ITER. Thermalized alpha particles, i.e., helium "ashes" constitute a key impurity within the plasma core. The helium ash accumulation within the tokamak plasma not only dilutes the fusion fuel, but also enhances the radiation energy loss. Eventually, these effects can prevent the fusion ignition and degrade the fusion output power even after ignition. Great progress has been made in determining

the transport coefficients D(r) and V(r) with helium puffing and simulation techniques. Obviously, those results are only valid for a specific machine under certain plasma conditions. The extrapolation to other devices still remains a problem. Physically, alpha particle transport is determined by the local plasma conditions. Therefore, the D and V should be a function of the plasma parameters. In our research, we assume that the helium transport scaling law has the form of power law. By using the experiment data from helium puffing in L-mode deuterium plasma on TFRR, the scaling laws of D and V are obtained with the least square analysis. Also, the significance of helium transport scaling law to the design is discussed.

Many studies have been reported on the simulation of impurity transport phenomena in the Tokamak fusion plasma using the MIST code (1,2,3). The MIST code is to solve the multi-ionization state impurity transport equations by assuming that the transport fluxes of different ionization states are known. In most simulations, the transport fluxes of impurities are usually expressed in terms of diffusion coefficient and convective velocities. By considering the "inverse" problem (vs.MIST), the basic idea of this research is to solve the one dimensional (ONE-D, with cylindrical geometry) impurity transport equations to determine the transport coefficients from the experimental impurity density evolution data. We have developed a computer code which is labelled as "DASH" to solve this problem. The alpha particle transport coefficients can be obtained and inter-corrected by using the MIST and this DASH code. This code also provides a way to check the simulation results of MIST code.

27944 (CONF-930281–7) **The role of plasma rotation on MHD instabilities in tokamaks.** Varadarajan, V.; Miley, G.H. Illinois Univ., Urbana, IL (United States). Fusion Studies Lab. [1993]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER54092. From 6. transport task force workshop; Newport, RI (United States); 21-25 Feb 1993. Order Number DE93013486. Source: OSTI; NTIS; INIS; GPO Dep.

An improved analysis of the linear stage of the internal kink mode has been developed to include plasma rotation and finite aspect ratio effects. The linear instabiliy growth rates are increased by the plasma rotation. A pseudo-variational, bilinear formalism is used to discretize the linear instability equations; Fourier decomposition is used in the periodic coordinate, and a mixed-finite element procedure is adopted in the radial direction. The numerical studies with the resulting PEST-like code can be used to predict the complex plasma eigenfrequencies. The finite aspect ratio results are similar to the large aspect ratio results for flow instability. The complex instability frequencies found in the "fishbone" and TAE modes would be strong determined by the large plasma rotation velocities observed in present-day tokamak devices. These effects could be studied by using the computationally convenient bilinear form derived from the Frieman-Rotenberg equation.

27945 (CONF-9304112–10) **Ion cyclotron heating experiments and plans for the Advanced Toroidal Facility (ATF).** Rasmussen, D.A.; Batchelor, D.B.; Goulding, R.J.; Hoffman, D.J.; Jaeger, E.F.; Rome, J.A.; Thomas, C.E. Oak Ridge National Lab., TN (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. topical conference on radio frequency power in plasmas; Boston, MA (United States); 1-3 Apr 1993. Order Number DE93012965. Source: OSTI; NTIS; INIS; GPO Dep.

Toroidal Facility (ATF) Ion Cyclotron Resonant Frequency (ICRF) experiments to date, a single-strap tunable antenna with carbon limiters has been used at power densities up to 13.6 MW/m^2 (900 kW). Hydrogen minority heating experiments at 14.4 MHz were performed in deuterium plasmas formed initially with both second-harmonic electron cyclotron heating (ECH) and helium neutral beam injection (NBI). No ICRF heating was observed in the low-density ECH target plasmas. Two distinct NBI plus ICRF operating modes are described. The moderate heating of these discharges is probably limited by impurities sputtered from the vessel walls and/or poorly confined orbits for the heated particles. A two-strap, phased antenna, designed to reduce impurities and capable of both minority and direct electron heating is described. A second antenna design for optimizing the coupling to well confined ion orbits, additional ICRF heating schemes, and methods for reducing the RF edge interactions in a stellarator geometry are also being considered.

27946 (CONF-9305231–1) **Nonlinear gyrofluid models of shear Alfven instabilities in ignited and beam heated toroidal plasmas.** Spong, D.A.; Hedrick, C.L.; Carreras, B.A. Oak Ridge National Lab., TN (United States). [1993]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International Atomic Energy Agency (IAEA) technical committee meeting; Trieste (Italy); 10-14 May 1993. Order Number DE93016235. Source: OSTI; NTIS; INIS; GPO Dep.

Shear Alfven instabilities driven by energetic beams and alpha populations are investigated using a reduced MHD-gyrofluid model with Landau closure. The moment equations for the fast ions are truncated in a way which incorporates the wave particle resonances that are required to destabilize the shear Alfven mode. These are coupled to an Ohm's law and vorticity equations which have been generalized to include ion FLR, electron and ion Landau damping. This model has been applied to experimentally observed regimes in a number of tokamak and stellarator devices. Both linearized growth rates and the nonlinear evolution are obtained. The saturated nonlinear regimes indicate mode number and frequency spectra which are generally consistent with experiment. A detailed examination of one typical nonlinear state has allowed identification of the dominant saturation mechanisms. This indicates that generation of n = 0, m = 0 sheared poloidal velocity flows and quasi linear modification of the q(r) profile can be important factors in reaching saturation.

27947 (CONF-930720–11) **Active probing of plasma edge turbulence and feedback studies on the Texas Experimental Tokamak (TEXT).** Uckan, T. (Oak Ridge National Lab., TN (United States)); Carreras, B.A.; Richards, B.; Bengtson, R.D.; Crockett, D.B.; Gentle, K.W.; Li, G.X.; Hurwitz, P.D.; Rowan, W.L.; Tsui, H.Y.W.; Wootton, A.J. Oak Ridge National Lab., TN (United States); Texas Univ., Austin, TX (United States). Fusion Research Center. [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;FG05-88ER53267. From 20. European conference on controlled fusion and plasma physics; Lisbon (Portugal); 26-30 Jul 1993. Order Number DE93015799. Source: OSTI; NTIS; INIS; GPO Dep.

The edge fluctuations play a critical role in the overall tokamak confinement. Experiments on TEXT show that electrostatic fluctuations in the edge plasma are the dominant mechanism for energy and particle transport. The basic mechanisms responsible for the edge turbulence are the subject of ongoing research in fusion devices. To understand the driving forces responsible for edge fluctuations, a novel experiment is underway on TEXT to actively modify the turbulence at the plasma edge by launching waves using electrostatic probes in the shadow of the limiter. This technique permits active probing of the spectral properties of the edge turbulence. This new approach to the study of edge fluctuations can provide more insight into the basic dynamics of the turbulence and may, in turn, enable detailed comparison with the theory. These experiments, which rely on the use of oscillating electric fields at the plasma edge, complement edge fluctuation control studies that are presently limited to the use of applied dc biasing to influence the edge electric field profile. These experiments have been extended to control of the edge plasma fluctuation level, using feedback to explore its effects on the edge turbulence characteristics as well as on confinement.

27948 (CONF-930720–12) **Equilibrium reconstruction of the q-profile in tokamaks from motional Stark effect data.** Hirshman, S.P. (Oak Ridge National Lab., TN (United States)); Lee, D.K.; Levinton, F.M.; Batha, S.H.; Okabayashi, M.; Wieland, R.M.

Oak Ridge National Lab., TN (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 20. European conference on controlled fusion and plasma physics; Lisbon (Portugal); 26-30 Jul 1993. Order Number DE93015815. Source: OSTI; NTIS; INIS; GPO Dep.

The motional Stark effect (MSE) diagnostic has been implemented on the Tokamak Fusion Test Reactor (TFIR) and the Princeton Beta Experiment (PBX-M) to obtain q-profile measurements in the presence of a finite-β plasma. A multichannel MSE parameter system has obtained data for several plasma conditions including L-mode, Supershot, current ramps and high β_p. Accurate measurement of the q-profile is essential for analysis of the equilibrium, stability and transport properties of a tokamak. Many externally observed phenomena, such as sawteeth and the beta collapse, can be analyzed principally in terms of the q and q (i.e., shear) profiles. Thus, the MSE measurement supplements the standard diagnostic suite of external magnetic probes to provide a new set of internal profile data which was previously unavailable. Using the MSE data, together with magnetic probe data, it is possible to obtain a self-consistent equilibrium reconstruction of the q-profile. Before describing the reconstruction technique, a brief review of the MSE diagnostic will be in this paper.

27949 (DOE/ER/53297–5) **High beta and confinement studies of TFTR: Progress report, April 15, 1992–April 14, 1993.** Navratil, G.A. (Columbia Univ., New York, NY (United States)); Bhattacharjee, A.; Iacono, R.; Mauel, M.E.; Sabbagh, S.A.; Kesner, J. Columbia Univ., New York, NY (United States). [1993]. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER53297. Order Number DE93016204. Source: OSTI; NTIS; INIS; GPO Dep.

The project discussed in this report are: Enhanced High Poloidal Beta Operation in TFTR with Deuterium Pellet Injection; Approaching High Q by Utilizing High β_p Operation in TFTR; Advanced Tokamak Regime Experiment, and Second Regime Studies at large Major Radius High β_p Plasmas. Analysis of the data taken during these experiments as well as continuing analysis of earlier data led to a number important results described in publications in the past year including two invited presentations at the 1992 American Physical Society Division of Plasma Physics Meeting in Seattle an oral presentation at the 1992 IAEA Meeting in Wuertzburg, Germany, and a Physical Review Letter. These results included extending the high 11/2 regime to 1.2 MA current and neutron production rates to more than 3×10^{16} sec^{-1}; the first experiments with 4 sec neutral beam injection on TFRR; the creation of the first beam and bootstrap current sustained plasmas on TFTR for more than a current relaxation time scale; the first observation of ideal NM ballooning modes in a large tokamak; and production of plasmas with the inner 3/4 of the plasma in or with stable access to the second stability regime. The principal results of these papers and supporting theory work are summarized below.

27950 (DOE/ER/54131–2) **Growth curve analysis for plasma profiles using smoothing splines: Annual progress report, June 1992–June 1993.** Imre, K. College of Staten Island, NY (United States). May 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER54131. Order Number DE93015741. Source: OSTI; NTIS; INIS; GPO Dep.

We are developing a profile analysis code for the statistical estimation of the parametric dependencies of the temperature and density profiles in tokamaks. Our code uses advanced statistical techniques to determine the optimal fit, i.e. the fit which minimized the predictive error. For a forty TFTR Ohmic profile dataset, our preliminary results indicate that the profile shape depends almost exclusively on q_a' but that the shape dependencies are not Gaussian. We are now comparing various shape models on the TFTR data. In the first six months, we have completed the core modules of the code, including a B-spline package for variable knot locations, a data-based method to determine the optimal smoothing parameters, self-consistent estimation of the bias errors, and adaptive fitting near the plasma edge. Visualization graphics already include three dimensional surface plots, and discharge by discharge plots of the predicted curves with error bars together with the actual measurements values, and plots of the basis functions with errors.

27952 (ENEA-RT-NUCL–91-07) **Contributions to 18th conference on controlled fusion and plasma physics.** ENEA, Frascati (Italy). Dipt. Fusione. Apr 1991. 40p. (CONF-9106293–Exc.: 18. European conference on controlled fusion and plasma heating, Berlin (Germany), 3-7 Jun 1991; RT/NUCL–91-07). Order Number DE93799255. Source: OSTI; NTIS (US Sales Only); INIS.

From the Contributions to the 18th Conference on Controlled Fusion and Plasma Physics (Berlin, June 3-7, 1991), separate abstracts were prepared for 9 papers. The topics were: the role of parametric decay instabilities and edge plasma fluctuations on the current drive efficiency of lower hybrid waves; neutral density in FT ohmic plasma; linear propagation and absorption of ion Bernstein waves in toroidal geometry; pressure anisotropy in ohmic FTU (Frascati Tokamak Upgrade) discharges; charged particle injection and fusion product escape; tokamak transport and ohmic confinement; spatial distribution of fast electrons on Asdex; electron heat diffusivity from temperature perturbations in the FT and FTU tokamaks; and the effects of ion bounce resonance on ideal and resistive MHD instabilities.

27953 (ENEA-RT-NUCL–91-07, pp. 5-8) **Role of parametric decay instabilities and edge plasma fluctuations on current drive efficiency of lower hybrid waves.** Pericoli-Ridolfini, V.; Cesario, R. ENEA, Frascati (Italy). Apr 1991. (CONF-9106293–Exc.: 18. European conference on controlled fusion and plasma heating, Berlin (Germany), 3-7 Jun 1991; RT/NUCL–91-07). In *Contributions to 18th conference on controlled fusion and plasma physics.* 40p. Order Number DE93799255. Source: OSTI; NTIS (US Sales Only); INIS.

Experimental current drive efficiency of lower hybrid frequency waves at 2.45 GHz was found to be less than 50% of its maximum value in Asdex when some plasma parameters and/or vessel conditions were changed. The available theories and numerical simulations of lower hybrid current drive (LHCD) fail to explain this observation (all the main quantities considered were taken into account when experimental data were processed). The decrease of LHCD efficiency was instead very well correlated to the spectral broadening of the frequency spectrum of the launched LH pump, as detected by a RF probe situated just outside the plasma column. This was possibly due to a modification of its parallel refraction index spectrum. This paper presents an analysis of the causes of this broadening and searches for possible similar effects due to the other main feature of the frequency spectrum, i.e., ion cyclotron satellites. This last point was investigated by comparing the decrease of the loop voltage when the ion cyclotron side-bands were either present or absent, and by maintaining all the other parameters constant. The cause of spectral broadening, either parametric decay instabilities (PDI's) involving low frequency ion sound quasi modes, or scattering by density fluctuations, were investigated experimentally and theoretically.

27954 (ENEA-RT-NUCL–91-07, pp. 9-12) **Neutral density in FT ohmic plasma.** Bracco, G.; Moleti, A.; Zanza, V. ENEA, Frascati (Italy). Apr 1991. (CONF-9106293–Exc.: 18. European conference on controlled fusion and plasma heating, Berlin (Germany), 3-7 Jun 1991; RT/NUCL–92-07). In *Contributions to 18th conference on controlled fusion and plasma physics.* 40p. Order Number DE93799255. Source: OSTI; NTIS (US Sales Only); INIS.

In tokamak plasma, the information on neutral density in the plasma core is very poor. If the ion temperature profile is known, however, the measurement of the charge exchange neutrals allows the evaluation of neutral density and, hence, the estimation of particle sources and fluxes which can be compared with the theoretical forecasts. FT tokamak results showed that the experimental ion temperatures agree well with Chang Hinton neoclassical forecasts and therefore the ion temperature profile obtained as the

solution of the ion power balance with neoclassical thermal conductivity was used to analyze the neutral particle analyzer (NPA) spectra. The radial profile of the neutral density was evaluated by means of a 1-D neutral transport code which solves the continuity equation for neutrals in a way similar to the ANTIC code. This paper reports on the verification of the accuracy of the neutral density determination by the simulation of the NPA fluxes for different selected plasma discharges.

27955 (ENEA-RT-NUCL–91-07, pp. 13-16) **Theory of linear propagation and absorption of ion Bernstein waves in toroidal geometry.** Cardinali, A.; Romanelli, F. ENEA, Frascati (Italy). Apr 1991. (CONF-9106293–Exc.: 18. European conference on controlled fusion and plasma heating, Berlin (Germany), 3-7 Jun 1991; RT/NUCL–91-07). In *Contributions to 18th conference on controlled fusion and plasma physics.* 40p. Order Number DE93799255. Source: OSTI; NTIS (US Sales Only); INIS.

Ion Bernstein Waves (IBW) injection experiments carried out on the DIII-D tokamak at high power levels (1 MW) have shown a very peripherical wave absorption and no significant central ion heating. This paper attempts to find an explanation for this unsuccessful result within the framework of the linear theory of IBW propagation and absorption and without invoking non-linear theories such as the onset of parametric decay instability. The solution, by choosing an appropriate ordering scheme for the relevant parameters (perpendicular wave number, ion Larmor radius and mode frequency), of the ray tracing equations for IBW propagation in toroidal geometry shows an oscillating behaviour of the parallel refraction index and a strong dependence of its amplitude on the poloidal angle at the antenna or, alternatively, on the value of the poloidal angle at the lower hybrid conversion layer. The calculation of the absorption along the trajectory was also obtained showing that rays launched at poloidal angles greater than 5 degrees are absorbed at the plasma periphery because of the strong increase of the parallel refraction index.

27956 (ENEA-RT-NUCL–91-07, pp. 17-20) **Pressure anisotropy in ohmic FTU discharges.** Alladio, F.; Buratti, P.; Grolli, M.; Marinucci, M.; Podda, S.; Zerbini, M.; Zoffoli, M. ENEA, Frascati (Italy). Apr 1991. (CONF-9106293–Exc.: 18. European conference on controlled fusion and plasma heating, Berlin (Germany), 3-7 Jun 1991; RT/NUCL–91-07). In *Contributions to 18th conference on controlled fusion and plasma physics.* 40p. Order Number DE93799255. Source: OSTI; NTIS (US Sales Only); INIS.

Analysis of some FTU (Frascati Tokamak Upgrade) shots revealed a remarkable discrepancy, observed as a transient behaviour, in plasma cross-sectional shape with neutron emission and dynamic energy confinement time being remarkably enhanced. Both the onset and evolution of this phenomenon appear to be connected with the plasma position: for its onset, it seems necessary that the plasma is in contact with the external limiter and removed from the internal one to such an extent that no lines of force connect the two limiters. When, during the event, the plasma returns to the internal limiter, the discrepancy starts to decline. Pressure anisotropy in the electrons seems to be ruled out by the fact that no signs of non-Maxwellian distribution functions occur on the ECE spectra. Pressure anisotropy in the ion distribution function seems to be ruled out because of the behaviour of the neutron emission that follows the increase of the density and the returning of the ion temperature to the electron temperature at higher densities. Therefore, a possible tentative explanation is that the extra energy is due to the bulk plasma toroidal rotation (with a velocity of the order of the ion thermal velocity) induced by the plasma becoming non-neutral with the contemporaneous charging of the limiters that are both electrically floating.

27957 (ENEA-RT-NUCL–91-07, pp. 21-24) **Charged particle injection and fusion product escape in separatrix stellarators.** Alladio, F.; Batistoni, P.; Mancuso, S. ENEA, Frascati (Italy). Apr 1991. (CONF-9106293–Exc.: 18. European conference on controlled fusion and plasma heating, Berlin (Germany), 3-7 Jun 1991; RT/NUCL–91-07). In *Contributions to 18th conference on controlled fusion and plasma physics.* 40p. Order Number DE93799255. Source: OSTI; NTIS (US Sales Only); INIS.

The main difficulty in the design of low aspect ratio torsatron/stellarator configurations is the increase of the collisionless losses of the charged fusion products. Whereas high aspect ratio stellarators can obtain up to a fraction (f_c = 97%) of the fast fused ions, the prompt losses increase to (1 - f_c) = 33% at a plasma aspect ratio of around 3. The two major drawbacks connected with such prompt losses are the damages to the surrounding structures (such as the superconducting magnets) and the fact the plasma will start charging up negatively at a very high rate. In this paper, the three surface current (idealized) stellarators, all with a poloidal winding number of 2 and all endowed with pronounced with magnetic separatrix features, are considered. It is shown that: in separatrix endowed stellarators, the fast ion losses are strongly focussed far from the torsatron windings along the in-board upper part (with the toroidal magnet field component B_{phi} greater than 0) of one of the separatrix tails; and by injecting charged fusible nuclei from the in-board lower part of the outer separatrix tail, particles could be deposited well inside the magnetic configuration. Neither the injection energy nor the pitch angle of injection appear to be critical.

27958 (ENEA-RT-NUCL–91-07, pp. 25-28) **Tokamak transport and ohmic confinement.** Bartiromo, R. ENEA, Frascati (Italy). Apr 1991. (CONF-9106293–Exc.: 18. European conference on controlled fusion and plasma heating, Berlin (Germany), 3-7 Jun 1991; RT/NUCL–91-07). In *Contributions to 18th conference on controlled fusion and plasma physics.* 40p. Order Number DE93799255. Source: OSTI; NTIS (US Sales Only); INIS.

Heat transport in tokamaks is empirically characterized by the existence of different regimes - the LOC regime (confinement time linearly increasing with density), the SOC regime (energy confinement time saturating at high density), and L-mode (energy confinement time), irrespective of heating method, degrading with heating power and improving with plasma current. The aim of this paper is to derive, by the use of simple arguments and by imposing dimensional constraints, a scaling which describes the behaviour of each regime and allows the prediction of tokamak confinement. Ohmic data obtained from experiments on the Asdex and FT tokamaks are used to check the validity of the scaling. The existence of a main transport mechanism responsible for the observed confinement time in the three regimes is suggested.

27959 (ENEA-RT-NUCL–91-07, pp. 29-32) **Spatial diffusion of fast electrons during 2.45 GHz experiment on ASDEX.** Barbato, E.; Bartiromo, R.; Gabellieri, L.; Tuccillo, A.A. ENEA, Frascati (Italy). Apr 1991. (CONF-9106293–Exc.: 18. European conference on controlled fusion and plasma heating, Berlin (Germany), 3-7 Jun 1991; RT/NUCL–91-07). In *Contributions to 18th conference on controlled fusion and plasma physics.* 40p. Order Number DE93799255. Source: OSTI; NTIS (US Sales Only); INIS.

Modulation of RF power is a well known technique in the study of plasma power deposition profiles and transport processes. This paper reports on Lower Hybrid (LH) power modulation experiments on the Asdex tokamak. The spatial distribution of LH generated fast electrons were investigated by comparing the experimental results with a simulation model. Plasma response was studied by measuring bremsstrahlung emission from fast electrons in the photon energy range from 40 to 500 keV with two systems: the first recorded simultaneously the emission from three radial chords, the second looked tangentially on the equatorial plane with a tangency point variable varying from 40 cm on the inner side to 20 cm on the outer side of the magnetic axis on a shot by shot basis. Both systems used three inch NaI detectors with a standard electronics and data acquisition systems.

27960 (ENEA-RT-NUCL–91-07, pp. 33-36) **Determination of electron heat diffusity from temperature perturbations in FT and FTU tokamaks.** Berton, F.; Bruschi, A.; Buratti, P.; Imperiali, C.; Romanelli, F.; Tudisco, O. ENEA, Frascati (Italy). Apr 1991. (CONF-9106293–Exc.: 18. European conference on controlled fusion and plasma heating, Berlin (Germany), 3-7 Jun 1991; RT/NUCL–91-07). In *Contributions to 18th conference on controlled fusion and plasma physics.* 40p. Order Number DE93799255. Source: OSTI; NTIS (US Sales Only); INIS.

The evolution of electron temperature perturbations following sawtooth collapse was measured at different radial positions by electron cyclotron emission (ECE) and used to determine electron heat diffusivity (chi e^{HP}) in the Frascati FT and FTU (Frascati Tokamak Upgrade) tokamaks. The electron heat diffusivity values

obtained on FT, using the time-to-peak method, were compared with the values resulting from steady state power balance (chi e^{PB}). The comparative analysis showed that electron heat diffusivity, as measured from heat pulse propagation, agreed well with steady state power balance diffusivity in almost all of the FT operative space. Agreement was lost at low densities and high safety factors in both the FT and FTU machines. These results were consistent with a microinstability transport model.

27961 (ENEA-RT-NUCL–91-07, pp. 37-40) **Effect of ion bounce resonance on ideal and resistive MHD instabilities.** Romanelli, F.; Fogaccia, G.; Graziadei, S. ENEA, Frascati (Italy). Apr 1991. (CONF-9106293–Exc.: 18. European conference on controlled fusion and plasma heating, Berlin (Germany), 3-7 Jun 1991; RT/NUCL–91-07). The effect of parallel compressibility on the stability of the resistive ballooning mode and on the m = 1 internal kink mode in collisional regimes, appropriate to present day tokamak experiments, has recently been investigated. As resistive instabilities are described by a two spatial scale structure in toroidal geometry, the effect of compressibility can be defined either with reference to the short scale of the order of the connection length, qR, with q being the safety factor, and R, the major radius, or with reference to the long scale associated with the radial localization of the mode. This paper, including the ion bounce frequency effect, investigates the stability of resistive ballooning modes in the long mean free path regime, and discusses the effect of the transit and bounce resonances in the external region on the m = 1 internal kink mode. The latter contribution is shown to yield a stabilizing effect by increasing the high frequency fishbone mode threshold level.

27962 (ENEA-RT-NUCL–91-08) **Contributions to 20th international conference on phenomena in ionized gases.** ENEA, Frascati (Italy). Dipt. Fusione. Apr 1991. 19p. (CONF-910711–Exc.: 20. international conference on phenomena in ionized gases, Barga (Italy), 8-12 Jul 1991; RT/NUCL–91-08). Order Number DE93799235. Source: OSTI; NTIS (US Sales Only); INIS.

From the Contributions to the ENEA (Italian Agency for New Technology, Energy and the Environment) July 8-12, 1991 (Il Ciocco, Barga, Italy), XX International Conference on Phenomena in Ionized Gases, separate abstracts were prepared for 4 papers. The topics were: evolution of the electric field of ion Bernstein waves in tokamaks, properties of the ablation cloud surrounding solid hydrogen pellets injected into tokamaks, the Frascati Tokamak Upgrade Thomson scattering system, and the role of feedback in the evolution of double layers.

27963 (ENEA-RT-NUCL–91-08, pp. 5-9) **Evolution of electric field of ion Bernstein waves in tokamaks.** Cardinali, A.; Cesario, R.; De Marco, F. ENEA, Frascati (Italy). Apr 1991. (CONF-910711–Exc.: 20. international conference on phenomena in ionized gases, Barga (Italy), 8-12 Jul 1991; RT/NUCL–91-08). In *Contributions to 20th international conference on phenomena in ionized gases.* 19p. Order Number DE93799235. Source: OSTI; NTIS (US Sales Only); INIS.

Central ion heating by directly launched or mode converted Ion Bernstein Waves (IBW) has been extensively investigated in recent years. Experiments at low (100:500 kW) power levels have been successfully carried out on the Alcator C and PLT tokamaks. The experiment at a higher power level (1MW) on DIII-D showed a peripherical absorption of the wave and no significant central ion heating was observed. This negative result can probably be attributed to a bad coupling of the big Faraday-shielded coil antenna which was employed in the experiment. The IBW experiment which is planed on FTU (the Frascati Tokamak Upgrade) could avoid the disadvantages of an antenna coil placed inside the vacuum vessel by using a waveguide antenna for the coupling similar to the grill of the LH experiments. With a frequency of 433 MHz and a toroidal magnetic field of 80 kG, the 4th ion-cyclotron harmonic of hydrogen is placed near the plasma centre and the 5th is located outside the vacuum vessel. Two ways of exciting IBWs are expected for the experiment on FTU: the direct launch of IBW or the excitation of IBWs after mode transformation of an Electron Plasma Wave (EPW), which occurs in the edge plasma region near the cold Lower Hybrid Resonance (CLHR) layer. The first way will require operation with the antenna mouth located behind the CLHR layer and the second, with this layer in front of the antenna. In this present work, the characteristics of the IBW were studied mainly in the scrape-off plasma region where the mode-transformation is expected.

27964 (ENEA-RT-NUCL–91-08, pp. 15-16) **FTU Thompson scattering system.** Bartiromo, R.; Brusadin, A.; Giovannozzi, E.; Orsitto, F.; Santi, D.; Briccola, M.; Garbi, M.; Giorgetti, G.; Mezzetti, S.; Pizzolati, P. ENEA, Frascati (Italy); Centro Informazioni Studi Esperienze (CISE), Milan (Italy). Apr 1991. (CONF-910711–Exc.: 20. international conference on phenomena in ionized gases, Barga (Italy), 8-12 Jul 1991; RT/NUCL–91-08). In *Contributions to 20th international conference on phenomena in ionized gases.* 19p. Order Number DE93799235. Source: OSTI; NTIS (US Sales Only); INIS.

This paper provides some brief notes on the Thomson scattering system recently installed on the Frascati (Italy) Tokamak Upgrade (FTU). Information is also given on some of the FTU's key design and operating features and its diagnostics instrumentation. The Thomson scattering system is based on a Nd-Ylf laser delivering a burst of 10 pulses, 20 ns FWHM, 5 J per pulse at lambda = 1,053 nm. The laser beam is focussed into the plasma by a telescope (1,700 focal length) to a maximum diameter of 0.9 mm (for 90% of the energy) over a length of 40 cm. The time interval between pulses can be set independently to between 20 and 100 ms. The wavelength was chosen in the infrared range in order to have less plasma light and a better S/N ratio. The expected S/N ratio for Thomson scattering, at a plasma density of 3*10/sup13/per cubic centimeter and temperature of 3 keV, lies between 20 and 30 for the central channels, and about 10 for the edge channels. Consequently the calculated (delta T)/T values are, respectively, about 4 and 15%, and the calculated (delta n)/n values are 3 and 10%.

27965 (ENEA-RT-NUCL–91-08, pp. 17-19) **Role of feedback in evolution of double layers.** Condrea, I. ENEA, Frascati (Italy). Apr 1991. (CONF-910711–Exc.: 20. international conference on phenomena in ionized gases, Barga (Italy), 8-12 Jul 1991; RT/NUCL–91-08). In *Contributions to 20th international conference on phenomena in ionized gases.* 19p. Order Number DE93799235. Source: OSTI; NTIS (US Sales Only); INIS.

A model is proposed for the evolution of the double layer (DL) and for the generation of potential relaxation instability (PRI). Experimental results are used to develop an analogy between the formation, movement and disruption of the DL and an electronic circuit with feedback, as well as, with systems that have 'externally regulated-self-regulated' coupling. It is shown how the evolution of the DL can be described by a system of loops in which the character of the feedback changes. Based on this analogy, the DL can be regarded as a superior organized plasma structure (i.e., more complex and more organized). A similar analogy is presented for the PRI.

27966 (ENEA-RT-NUCL–91-21) **Effects of radial diffusion on triton burn up.** Batistoni, P.; Anderson, D.; Lisak, M. ENEA, Frascati (Italy). Dipt. Fusione; Chalmers Univ. of Technology, Goeteborg (Sweden). Inst. for Electromagnetic Field Theory and Plasma Physics. Nov 1991. 35p. (CONF-9106209–7: International Atomic Energy Agency (IAEA) technical committee meeting on alpha particles in fusion, Aspenas (Sweden), 10-14 Jun 1991; RT/NUCL–91-21). Order Number DE93799306. Source: OSTI; NTIS (US Sales Only); INIS.

A detailed investigation is made of the effect of finite confinement time and radial diffusion on the burn up of fusion produced 1 MeV tritons in hot deuterium plasmas. Explicit expressions are obtained for the concomitant reduction in total triton burn up and applications to JET and TFTR burn up measurements indicate diffusion constants D= 0.1-0.2m2/s for the fast tritons if the reduction is due to radial diffusion. The time dependence and the width of the emission profile of the 14 MeV neutrons from the triton burn up are also analyzed. Recent measurements of 14 MeV emission profiles on JET indicate a much smaller diffusion constant, viz. D 0.1 2m2/s. This implies that the observed finite confinement time of the tritons should not be due to radial diffusion and that the diffusion constant of the fast tritons should be very small.

27967 (ENEA-RT-NUCL–92-12, pp. 17-30) **Impurity screening in high density plasmas in tokamaks with limiter configuration.** Ferro, C.; Zanino, R. ENEA, Frascati (Italy); Politecnico di Torino, Turin (Italy). May 1992. (CONF-920311–Exc.: 10. international conference on plasma-surface interactions in controlled fusion devices, Monterey, CA (United States), 30 Mar - 3 apr 1992; RT/NUCL–92-12). In *Contributions to 10th international conference on plasma surface interactions.* 42p. Order Number DE93799249. Source: OSTI; NTIS (US Sales Only); INIS.

Impurity screening in high-density plasmas in tokamaks with a limiter configuration is investigated by means of a simple semi-analytical model. An iterative scheme is devised, in order to self-consistently determine the value of scrape-off layer thickness, edge electron density and temperature, and the main plasma contamination parameter, Z_{eff}, as a function of given average electron density and temperature in the main plasma and given input power. The model is applied to the poloidal limiter case of the Frascati Tokamak Upgrade, and the results are compared with experimental data. Reasonable agreement in the trends is found, emphasizing the importance of a high edge plasma density for obtaining a clean main plasma in limiter tokamaks.

27968 (ENEA-RT-NUCL–92-14) **Contributions to 1992 international conference on plasma physics.** ENEA, Frascati (Italy). Dipt. Fusione. May 1992. 40p. (CONF-920610–Exc.: ICPP 92: International conference on plasma physics, Innsbruck (Austria), 29 Jun - 3 jul 1992; RT/NUCL–92-14). Order Number DE93799278. Source: OSTI; NTIS (US Sales Only); INIS.

From the Contributions to the 1992 International Conference on Plasma Physics (Innsbruck, June 29 - July 3), separate abstracts were prepared for 9 papers. The topics included: the ion temperature gradient driven mode threshold; density limit and refuelling in FTU (Frascati Tokamak Upgrade) ohmic operation; FTU energy confinement; MHD equilibrium code for the ITER (International Thermonuclear Experimental Reactor) tokamak; FTU effective ion charge and impurity behaviour; FTU profile consistency and volt-second consumption; visible spectroscopic measurements; and alpha particle behaviour outside last closed magnetic surface in divertor stellarators.

27969 (ENEA-RT-NUCL–92-14, pp. 5-8) **Threshold of ion temperature gradient driven mode.** Guo, S.C.; Romanelli, F.; Rewoldt, G.; Tang, W.M. ENEA, Frascati (Italy); Princeton Univ., NJ (United States). Plasma Physics Lab. May 1992. (CONF-920610–Exc.: ICPP 92: International conference on plasma physics, Innsbruck (Austria), 29 Jun - 3 jul 1992; RT/NUCL–92-14). In *Contributions to 1992 international conference on plasma physics.* 40p. Order Number DE93799278. Source: OSTI; NTIS (US Sales Only); INIS.

The ion temperature gradient driven mode is believed to play a major role in affecting energy transport in tokamak devices. The relative mode dynamics near threshold are affected by several kinetic effects. This paper gives a unified picture of the ion temperature gradient driven mode dynamics through the use of model differential equations and general explicit expressions for the threshold which are valid in the entire parameter range of interest. It is found that the results agree very well with those obtained with the use of the numerical solutions of the full kinetic integral equation. The stability analysis is separated into two parts - short and long wavelength limits. The assumptions of a pure plasma with circular shape and low beta equilibrium are used along with the electrostatic equation. Nevertheless, the range of validity of the results covers the whole collisionality domain of interest, long and short wavelengths, and moderately low and finite shear, and peaked and flat density profiles. In addition, the study fully accounts for the effects related to toroidal geometry.

27970 (ENEA-RT-NUCL–92-14, pp. 9-12) **Density limit and refuelling in FTU ohmic operation.** Frigione, D.; Tonini, G. ENEA, Frascati (Italy). May 1992. (CONF-920610–Exc.: ICPP 92: International conference on plasma physics, Innsbruck (Austria), 29 Jun - 3 jul 1992; RT/NUCL–92-14). In *Contributions to 1992 international conference on plasma physics.* 40p. Order Number DE93799278. Source: OSTI; NTIS (US Sales Only); INIS.

The Frascati Tokamak Upgrade (FTU) device (R=0.93 m; a=0.3 m; toroidal field = 8 T; toroidal current = < 1.6 MA) has been operating during the last two years in the ohmic regime with H_2, D_2 and He filling gases. Most of the H_2 and D_2 data, if plotted in the traditional Hugill plot, show a q-independent density limit, corresponding to $nR/B=2.3x10^{19}$ Wb^{-1}. This reproduces the FT density limit at a safety factor (q)=6.7, while is a factor of 2 lower at q=3.3; at this value, the FT limit has been fully recovered in He. Peaked density profile discharges have a higher nRq/B parameter, thus supporting the idea that the limiting density is that of the edge.

27971 (ENEA-RT-NUCL–92-14, pp. 17-20) **Application of reconstructive MHD code based on formalism of toroidal multipoles to iter tokamak.** Alladio, F.; Lalousis, P.; Micozzi, P. ENEA, Frascati (Italy). May 1992. (CONF-920610–Exc.: ICPP 92: International conference on plasma physics, Innsbruck (Austria), 29 Jun - 3 jul 1992; RT/NUCL–92-14). In *Contributions to 1992 international conference on plasma physics.* 40p. Order Number DE93799278. Source: OSTI; NTIS (US Sales Only); INIS.

One of the most important diagnostic techniques for current and future tokamak experiments aimed at thermonuclear ignition is MHD equilibrium simulation based on data from magnetic probes measuring magnetic fields and fluxes on a contour enclosing the plasma column. The aim of this paper is to generalize the ODIN equilibrium code so as to obtain the capability of: treating any possible magnetic probe set; quickly identifying plasma boundary characteristics; obtaining global plasma quantities, as well as, information on local equilibrium quantities such as safety factor and toroidal current density profiles. In order to simulate equilibria relative to the ITER (International Thermonuclear Experimental Reactor) tokamak, the ODIN code (incorporating the Grad-Shafranov equation) was interfaced with the finite element prediction code, PROTEUS, which determines the values of the fluxes and magnetic fields at the probe positions for current ITER reference scenarios.

27972 (ENEA-RT-NUCL–92-14, pp. 21-24) **Effective ion charge and impurity behavior in Frascati tokamak upgrade.** McNeill, D.H.; Zanza, V.; Mazzitelli, G.; Bracco, G.; Condrea, I.; De Angelis, R.; Orsitto, F.; Panaccione, L.; Segre, S. ENEA, Frascati (Italy). May 1992. (CONF-920610–Exc.: ICPP 92: International conference on plasma physics, Innsbruck (Austria), 29 Jun - 3 jul 1992; RT/NUCL–92-14). In *Contributions to 1992 international conference on plasma physics.* 40p. Order Number DE93799278. Source: OSTI; NTIS (US Sales Only); INIS.

The effective ion charge, Zeff, is an important measure of plasma purity in tokamak discharges. In the Frascati Tokamak Upgrade (FTU), diametral average values of Zeff, obtained from visible bremsstrahlung and from the Spitzer plasma resistivity for ohmically heated discharges, are generally in good agreement. This paper discusses the two types of measurements and relates the behaviour of Zeff to the impurities in the plasma. The major object of study on the FTU is high density plasmas with high heat loads on the limiters. Understanding the variation of Zeff with time and density in FTU plasmas involves questions of plasma initiation and fuelling, as well as, transport. This paper limits the examination of this topic to a brief review of the relationships between Zeff and the impurities observed by visible and UV spectroscopy. The main light impurity now observed in the FTU is oxygen, while nickel and chromium are the major heavy impurities. Oxygen is desorbed from the walls, while the metallic impurities are produced by sputtering, from (mostly) the limiter. In general, the influx of metallic impurities into a discharge decreases as the electron density rises and, depending on the plasma current, almost disappears at the maximum density attained in ohmic discharges. Systematic changes in the impurity influxes over the early operating period of the FTU have been mirrored in a gradual decline of Zeff.

27973 (ENEA-RT-NUCL–92-14, pp. 25-28) **Profile consistency on FTU.** Buratti, P.; Zerbini, M.; Bracco, G.; Segre, S.E.; Zanza, V. ENEA, Frascati (Italy). May 1992. (CONF-920610–Exc.: ICPP 92: International conference on plasma physics, Innsbruck (Austria), 29 Jun - 3 jul 1992; RT/NUCL–92-14). In *Contributions to 1992 international conference on plasma physics.* 40p. Order Number DE93799278. Source: OSTI; NTIS (US Sales Only); INIS.

The analysis of several tokamak experiments revealed that the electron temperature profile shape is not influenced by plasma parameters such as current, density and magnetic field, except for a dependence on the edge safety factor, q_a, for $r/a<0.6$. Both this dependence and the law governing the peaking factor can be explained as effects of sawtooth instability that keeps the central q close to one. This paper presents the first observations on the shape of the electron temperature profile on the FTU (Frascati Tokamak Upgrade) tokamak (major radius, 0.935 m; limiter radius, 0.3 m; magnetic field, B<8 T).

27974 (ENEA-RT-NUCL–92-14, pp. 29-32) **Volt-second consumption and current ramp experiments on FTU.** Apruzzese, G.; Crisanti, F.; Frigione, D.; Kroegler, H.; Lovisetto, L.; Mazzitelli, G.; Podda, S.; Buratti, P.; Zerbini, M.; Romanelli, F. ENEA, Frascati (Italy). May 1992. (CONF-920610–Exc.: ICPP 92: International conference on plasma physics, Innsbruck (Austria), 29 Jun - 3 jul 1992; RT/NUCL–92-14). In *Contributions to 1992 international conference on plasma physics.* 40p. Order Number DE93799278. Source: OSTI; NTIS (US Sales Only); INIS.

The volt-second consumption in the Frascati Tokamak Upgrade (FTU) was evaluated both during plasma start-up and current ramp-up from one flat top level to a higher flat top level. The Poynting definition was used to work out the resistive volt-second consumption; the equilibrium reconstruction ODIN code was used to get the necessary physical quantities. The Ejima parameter was evaluated for a large set of shots in hydrogen, deuterium and helium. Current ramp-down experiments were performed on the FTU at rates up to 9 MA/s, in order to study current diffusion with transiently decoupled current and electron temperature profiles. As the current profile is not directly measured in the FTU, its evolution was calculated by the JETTO code and the resulting plasma internal inductance was compared to the measured one. This paper presents and discusses the the results of FTU shot 3322 in which the current varied from 500 to 280 kA in 40 ms at a rate of 5.5 MA/s, about six times faster than the L/R decay rate. No evidence of anomalous current diffusion was found. Given experimental uncertainties, simulations assuming Spitzer resistivity agree with measured data both taking into account and neglecting trapped particle corrections.

27975 (ENEA-RT-NUCL–92-14, pp. 33-36) **Visible spectroscopic measurements on FTU.** Condrea, I.; Bartiromo, R.; Mazzitelli, G.; McNeill, D.H. ENEA, Frascati (Italy). May 1992. (CONF-920610–Exc.: ICPP 92: International conference on plasma physics, Innsbruck (Austria), 29 Jun - 3 jul 1992; RT/NUCL–92-14). In *Contributions to 1992 international conference on plasma physics.* 40p. Order Number DE93799278. Source: OSTI; NTIS (US Sales Only); INIS.

Visible spectroscopy has been extensively used on the FTU (Frascati Tokamak Upgrade) to measure the intensity of the spectral lines of hydrogen, light impurities (C,O,N) and metallic impurities (Ni, Cr, Fe). The plasma light was collected along selected tangential and radial chord views in order to observe the vacuum chamber wall and the limiter respectively. The visible light emitted by atoms and ions was collected by a telescope and focused onto one end of a 1mm diameter optics fiber. The other end of this quartz fiber (f/3) was directly attached onto the entrance slit of a Monospec 27 grating spectrometer (f/3.8) and equipped at the exit slit with an intensified linear diode array. The spectrometer can use 3 different gratings in order to have linear dispersions of 3, 6 and 24 nm/mm. The second and the gratings were used in the FTU experiments to cover a spectral range of 3000 A and 700 A respectively. The spectrometer was calibrated in absolute intensity using a calibrated lamp and a lambertian diffuser. The impurity influx was derived from the absolute line intensity through the calculated value of ionization to photon emission ratio.

27976 (ENEA-RT-NUCL–92-17) **Resistive toroidal stability of internal kink modes in circular and shaped tokamaks.** Vlad, G.; Bodenson, A.; Lutjens, H. ENEA, Frascati (Italy). Dipt. Fusione; Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherches en Physique des Plasmas. Jul 1992. 34p. (RT/NUCL–92-17). Order Number DE93799305. Source: OSTI; NTIS (US Sales Only); INIS.

The linear resistive magnetohydrodynamic (MHD) stability of the internal kink mode in tokamaks is studied by toroidal computations. The stabilizing influence of the small aspect ratio is confirmed, but it is found that shaping of the cross section influences the internal kink stability significantly. For finite pres sure and small resistivity, curvature effects at the q=1 surface give rise to asensitive dependence on shape; and ellipticity (including JET shape) is destabilizing. Only a very restricted set of finite pressure equilibria is completely stable for $q0<1$. A typical result is that the resistive kink mode is slowed down by toroidal effects to a weak tearing/ resistive interchange mode. It is suggested that weak resistive instabilities are stabilized during the ramp phase of teeth by effects not included in the linear resistive MHD model. Possible mechanisms for triggering a sawtooth crash are discussed.

27977 (ENEA-RT-NUCL–92-22) **Ion Bernstein wave propagation and absorption in general magnetic field configuration.** Cardinali, A.; Riccardi, C. ENEA, Frascati (Italy); Milan Univ. (Italy). Dipt. di Fisica. Dec 1992. 15p. (RT/NUCL–92-22). Order Number DE93799265. Source: OSTI; NTIS (US Sales Only); INIS.

A linear analysis of the Ion Bernstein Waves (IBW) propagation and absorption is presented by considering a general tokamak plasma magnetic equilibrium. The effects of elongation, triangularity and Shafranov-shift on the rf absorption is discussed with respect to the simple case of circular and concentric magnetic surfaces. The ray-tracing equations are analytically and numerically solved in the flux surface coordinate system and the power deposited into the plasma is calculated along the trajectory. It is found that the absorption of the wave results strongly affected by the geometry of the magnetic surfaces. Whereas the Shafranov shift does not produce any relevant effects on the wave damping at least for $beta_{pol}=O(1)$, high elongated plasmas act in reducing the peripheral electron absorption and allow the penetration of the wave at the resonance layer. High triangularity, on the contrary, induces a strong electron absorption localized in the plasma periphery.

27978 (ETDE-IT–93-159) **Stability analysis of ion temperature gradient mode in non-circular tokamak geometry.** Guo, S.C.; Romanelli, F. ENEA, Frascati (Italy). 1992. 7p. (CONF-920813–4: Joint Varenna-Lausanne international workshop on theory of fusion plasmas, Varenna (Italy), 24-28 Aug 1992). Order Number DE93799229. Source: OSTI; NTIS (US Sales Only); INIS.

This paper studies the tokamak shaping effects on the ion temperature gradient modes in the long wave length limit (poloidal wave number^2 ion Larmor radius^2 << epsilon T^{1-2}). A model equilibrium with non circular cross section is employed, where the elongation, the Shafranov shift and the triangularity are all taken into account. It was shown that when the value of the poloidal wave number is lower than epsilon T^{1-4}-ion Larmor radius, the ion temperature gradient modes have a broad structure, and two branches exist. One of them is characterized by a variation along the equilibrium magnetic field dominated by the secular scale, with superimposed small oscillations on the connection length scale. This is the so called slablike branch. The effects of the normal curvature in this branch tend to be averaged out while the geodesic curvature simply yields a renormalization of the inertia term through the Pfirsch-Schluter enhancement factor. The other branch, peculiar to toroidal geometry, is the so called toroidicity induced branch, characterized by eigenfunctions varying over the connection-length scale with their envelop varying over the secular scale. In this paper, it is shown that in addition to this toroidal branch, the non-circular effects can induce new unstable branches.

27979 (ETDE-IT–93-163) **Comments on article 'Enhanced carbon influx into TFTR supershots', by A.T. Ramsey et al., Nuclear Fusion 31, 1811-1825 (1991).** McNeill, D.H. ENEA, Frascati (Italy). 1992. 5p. Order Number DE93799233. Source: OSTI; NTIS (US Sales Only); INIS.

In their article Ramsey et al. relate the development of 'carbon blooms' and the deterioration of confinement in high-power discharges in TFTR to increases in the light detected at 6578 A (corresponding to line emission of the C+ ion), 4649 A (C++), 6563-6561 A (H and D alpha), and 5235 A (bremsstrahlung continuum). In particular, the temperatures of localized hot regions on the limiter are correlated to emission at these wavelengths in an attempt to determine threshold temperatures for radiation enhanced sublimation (RES) and thermal sublimation. They have, however, omitted the contribution to their intensity data from the thermal

emission of incandescent regions of the limiter. This oversight will lead to errors in the interpretation of data on the onset of RES because the visible black body radiation reaching the detectors can form a large part of the observed signal levels. Since no spectrum line profiles have been provided, we cannot know what fraction of the reported visible intensities actually come from the plasma. The following discussion shows that a strong continuum signal from thermal radiation of incandescent surfaces must be present in at least some of the reported measurements. This analysis does not exclude further contributions from small (diameter <1 mm), dense plasmas on the limiter of the type that might be produced, for example, in unipolar arcs as the plasma comes close to the limiter.

27980 (ETDE-IT–93-167) **Gyrokinetic particle simulation using delta F-bar algorithm.** Briguglio, S.; Romanelli, F.; Betello, G. ENEA, Frascati (Italy). 1992. 10p. (CONF-9206381–1: Technical committee meeting on advances in simulation and modelling of thermonuclear plasmas, Varennes (Canada), 15-17 Jun 1992). Order Number DE93799244. Source: OSTI; NTIS (US Sales Only); INIS.

Ion temperature gradient driven modes are generally considered as possible candidates to explain anomalous transport in tokamaks. Quasi-linear estimates of the transport coefficients, based on mixing length arguments yield a fairly qualitative agreement with the parametric dependence of experimental data; but the quantitative agreement seems to be too rough. Recently, fluid code simulations of the ion temperature gradient driven mode turbulence have shown that a strong thermal ion flux reduction, correlated with the formation of large scale coherent structures, can occur. It is relevant to investigate how these phenomena are affected by the inclusion of kinetic effects such as finite ion Larmor radius effects and wave particle resonances. Gyrokinetic particle simulations of the ion temperature gradient driven mode turbulence are suited to address this point because they evolve model equations which include kinetic mechanisms, but still retain the effect of the gyromotion in the average sense, thus allowing for larger simulation time-step and grid-spacing. This paper aims to point out some of the problems concerning particle distribution loading in gyrokinetic simulations, and to discuss the advantages of adopting the so-called delta F-bar algorithm to properly solve these problems. Some preliminary results related to ion-flux reduction and coherent-structure occurence are also presented.

27981 (ETDE-IT–93-168) **Propagation and absorption of electromagnetic waves in collisional, partially ionised gases.** De Marco, F. ENEA, Frascati (Italy). 1992. 18p. (CONF-9209189–3: Industrial applications of plasma physics workshop, Varenna (Italy), 2-12 Sep 1992). Order Number DE93799248. Source: OSTI; NTIS (US Sales Only); INIS.

This paper first briefly reviews the principal collision processes occurring in the outer boundary of tokamak plasmas in which case the effects of collisions of charged particles with neutrals and with themselves in phenomena such as wave propagation must be taken into account. Practical expressions are developed for cross sections and collision frequencies. The paper then considers propagation and absorption of microwaves or other electromagnetic waves injected into tokamak plasma. The plasma is described with a fluid model and, in the moment balance equation, a momentum damping term, proportional to the product of collision frequency and the velocity vector, is included to account for collisional effects. A plane wave approach in an infinite homogeneous medium is used for the simplification of the analysis. Finally, brief comments are made on the possibilities and limitations of particle wave resonances.

27982 (ETDE-IT–93-171) **Linear and nonlinear stability of toroidal Alfven eigenmodes.** Vlad, G.; Briguglio, S.; Kar, C.; Zonca, F.; Romanelli, F. ENEA, Frascati (Italy). Sep 1992. 22p. (CONF-920813–5: Joint Varenna-Lausanne international workshop on theory of fusion plasmas, Varenna (Italy), 24-28 Aug 1992). Order Number DE93799253. Source: OSTI; NTIS (US Sales Only); INIS.

In the gaps of the continuum Alfven spectrum discrete, global modes induced by toroidicity (the so called Toroidal Alfven Eigenmodes or TAE) have been shown to exist. These modes can be destabilized by the resonant interaction with the parallel motion of the energetic ions, as alpha particles produced in fusion reactions. The TAE stability is determined by the competition between such a driving mechanism and the coupling with the Alfven continuum which provides a damping. The numerical study of the effect of high energetic particles on MHD modes requires the solution of the fluid equations for the bulk plasma and of the kinetic equations for the energetic particles (from which the name, hybrid codes, is derived). In this paper, the hybrid code will be described. Detailed results of the dynamics of the Alfven continuum, a primary importance issue for a correct description of the mode damping, will be given. Here we focus on the Toroidal Alfven Eigenmode dynamics in the absence of energetic particles with particular emphasis to the dependence of the damping rate on resistivity and on the interaction with Alfven continuum. An analytical model for the TAE nonlinear saturation, based on a three mode coupling truncated scheme of the MHD equations, is also presented.

27983 (ETDE-IT–93-172) **Kinetic theory of fishbone mode.** Fogaccia, G.; Romanelli, F. ENEA, Frascati (Italy). Sep 1992. 9p. (CONF-920813–6: Joint Varenna-Lausanne international workshop on theory of fusion plasmas, Varenna (Italy), 24-28 Aug 1992). Order Number DE93799254. Source: OSTI; NTIS (US Sales Only); INIS.

A population of energetic trapped particles can play a destabilizing role on the internal kink mode and excite a high frequency mode (fishbone mode) by a resonant interaction with the magnetic drift frequency of the hot ions. Parallel compressibility effects are not properly accounted for by the MHD model. If the fishbone mode frequency is comparable with the ion transit frequency, parallel compressibility effects become important and a kinetic description is necessary for the thermal ions. Transit and bounce resonance effects in the inertial layer have been considered in previous publications, while the extension of such analysis to the external region, is considered in this work. In addition, the non-resonant effects are also discussed. The aim of the work is to characterize the region of parameter space which is stable against the internal kink and fishbone modes.

27984 (ETDE-IT–93-181) **Model for linear and non-linear stages of 2-D Rayleigh-Taylor instability.** Wouchuk, J.G. ENEA, Frascati (Italy). 1993. 23p. Order Number DE93799268. Source: OSTI; NTIS (US Sales Only); INIS.

Relevant to studies on the acceleration and stagnation phases of inertial confinement fusion targets, a new model is developed which describes the evolution of the 2-D Rayleigh-Taylor instability by evaluating the rate of change of the vorticity generated at the unstable interface. For single mode perturbations, the known results for the linear growth rate and for the asymptotic bubble velocity are recovered. The stabilizing effect of mass ablation is also evidenced. In the case of multi-mode perturbations, the model predicts growth of the highest rising bubbles in agreement with recent experiments and numerical simulations.

27985 (ETDE-IT–93-182) **Possibility of achieving very good confinement in compact high-field tokamaks.** Segre, S.E.; Zanza, V. ENEA, Frascati (Italy). 1993. 10p. Order Number DE93799270. Source: OSTI; NTIS (US Sales Only); INIS.

Compact high-field tokamaks have operated only at relatively low values of beta. The recovery in such devices of values of beta typical of low-field tokamaks would be important. In a recent analysis the thermal energy content of a wide range of tokamaks was successfully reproduced by using only the momentum and particle balance equations. Extending here the analysis to possible future experiments, it is found that, by using low energy neutral beam injection, it may be possible, in high-field tokamaks, to achieve relatively high values of beta with a low power expenditure and, therefore, a large confinement time.

27986 (ETDE-IT–93-183) **Simultaneous measurement by polarimetry of both electron line density and poloidal magnetic field in tokamaks.** Segre, S.E. ENEA, Frascati (Italy). 1993. 17p. Order Number DE93799271. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown how one can measure at the same time both the electron line density and the poloidal magnetic field in a tokamak,

using only a polarimeter in order to determine the full state of polarization of radiation transmitted across the plasma. The proposed polarimeter is simpler and more flexible than the more conventional interferometer/polarimeter used at present on various tokamaks.

27987 (ETDE-IT–93-188) **Fast electron confinement during lower hybrid experiments in Asdex.** Bartiromo, R.; Barbato, E.; Gabellieri, L.; Spaziani, A.; Tuccillo, A.A. ENEA, Frascati (Italy); Max-Planck-Institut fuer Plasmaphysik, Garching (Germany). 1992. 29p. Order Number DE93799275. Source: OSTI; NTIS (US Sales Only); INIS.

This paper presents a detailed analysis of experimental data on the energy content in the fast electron population created by lower hybrid waves in the Asdex tokamak and shows that, in most circumstances, direct losses due to diffusion of these electrons can be neglected. The value of the diffusion coefficient of fast electrons is inferred from the time behaviour of hard X- ray emission during power modulation experiments. It turns out that fast electrons are better confined than the thermal ones. This experimental result is compared with predictions of theories based on transport driven by electrostatic or magnetic turbulence.

27988 (ETDE-IT–93-189) **Analytic expression for influence of plasma birefringence on Faraday rotation measurements in tokamak plasma.** Segre, S.E.; Nowak, S. ENEA, Frascati (Italy). 1992. 16p. Order Number DE93799276. Source: OSTI; NTIS (US Sales Only); INIS.

An approximate analytic expression is given for the influence of plasma birefringence on Faraday rotation in tokamaks and the range of validity is determined. The expression is of interest for polarimetric measurements and for the analysis of electron cyclotron emission.

27989 (EUR-CEA-FC–1471) **Transport in a fusion plasma in presence of a chaotic magnetic field.** Nguyen, F. Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee; Paris-7 Univ., 75 (France). Sep 1992. [216p.] (In French). Source: OSTI; NTIS (US Sales Only); INIS.

In the tokamak Tore Supra, the magnetic field ensuring the confinement is stochastic at the plasma edge due to a resonant perturbation. This perturbation is created by a set of six helicoidal coils inside the vacuum vessel, the ergodic divertor. The first part of the study concerns the analysis of the transport of particles and energy in a fusion plasma in presence of a stochastic magnetic field, without physical wall. The effective transport of electrons, i.e. heat transport, increases. The ions transport increases too but less than heat transport. The discrepancy produces a mean radial electric field. The second part is devoted to the influence of the physical wall. The topology of the magnetic connexion on the wall is precisely determined with the code Mastoc. The transport of particles and energy is then described from the confined plasma until the wall. This study enlights severals important observations of the experience Tore Supra in the ergodic divertor configuration: the spreading of the power deposition on the wall components without anomalous concentration, the robustness of this configuration relatively to misalignment, the edge structures visible in H_α light during plasma reattachment. In order to study the transport of impurity ions, a variational approach of minimum entropy production has been developped. This principle is applied to the calculation of the neoclassical diffusion of impurity ions with the radial electric field. This electric field deconfines ions if the pressure profile is not balanced by a Lorentz force, i.e. if the plasma is locked in rotation, poloidally and toroidally, because of magnetic perturbation or friction force.

27990 (GA-A–21257) **Dimensionally similar discharges with central rf heating on the DIII-D tokamak.** Petty, C.C.; Luce, T.C.; Pinsker, R.I. General Atomics, San Diego, CA (United States). Apr 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-9304112–11: 10. topical conference on radio frequency power in plasmas, Boston, MA (United States), 1-3 Apr 1993). Order Number DE93012776. Source: OSTI; NTIS; INIS; GPO Dep.

The scaling of L-mode heat transport with normalized gyroradius is investigated on the DIII-D tokamak using central rf heating. A toroidal field scan of dimensionally similar discharges with central ECH and/or fast wave heating show gyro-Bohm-like scaling both globally and locally. The main difference between these restats and those using NBI heating on DIII-D is that with rf heating the deposition profile is not very sensitive to the plasma density. Therefore central heating can be utilized for both the low-B and high-B discharges, whereas for NBI the power deposition is decidedly off-axis for the high-B discharge (i.e., high density).

27991 (GA-A–21292) **Modification of electrical conductivity in T-10 by electron cyclotron heating.** Harvey, R.W.; Forest, C.B.; Sauter, O.; Lohr, J.; Lin-Liu, Y.R. General Atomics, San Diego, CA (United States). Apr 1993. 4p. Sponsored by USDOE, Washington, DC (United States); Swiss National Science Foundation, Bern (Switzerland). DOE Contract AC03-89ER51114. (CONF-9304112–14: 10. topical conference on radio frequency power in plasmas, Boston, MA (United States), 1-3 Apr 1993). Order Number DE93014313. Source: OSTI; NTIS; INIS; GPO Dep.

The CQL3D Fokker-Planck code is used to investigate effects of quasilinear distortion of the electron tail in the T-10 second harmonic electron cyclotron current (ECCD) drive experiment. The experiment operates in a regime of substantial tail formation. Current drive efficiency may be doubled relative to low power cases, That portion of electric field-driven current which is synergetic with the rf-induced nonthermal tail may tend to cancel the ECCD current in relevant cases.

27992 (GA-A–21301) **Beta-limiting instabilities in DIII-D discharges with large bootstrap current.** Strait, E.J.; Taylor, T.S.; Turnbull, A.D.; Chu, M.S.; Ferron, J.R.; Lao, L.L.; Osborne, T.H. General Atomics, San Diego, CA (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-930720–10: 20. European conference on controlled fusion and plasma physics, Lisbon (Portugal), 26-30 Jul 1993). Order Number DE93015476. Source: OSTI; NTIS; INIS; GPO Dep.

Short communication. DOUBLET-3 DEVICE/kink instability; BOOTSTRAP CURRENT; EDGE LOCALIZED MODES; MHD EQUILIBRIUM; H-MODE PLASMA CONFINEMENT

27993 (GA-A–21304) **Active density control in DIII-D H-mode plasmas.** Mahdavi, M.A. (General Atomics, San Diego, CA (United States)); Schaffer, M.J.; Anderson, P.M.; Baxi, C.B.; Brooks, N.H.; Burrell, K.H.; Campbell, G.L.; deGrassie, J.S.; Evans, T.E.; Ferron, J.R.; Groebner, R.J.; Hinton, F.L.; Hollerbach, M.A.; Hyatt, A.W.General Atomics, San Diego, CA (United States); Lawrence Livermore National Lab., CA (United States); Sandia National Labs., Albuquerque, NM (United States); Oak Ridge National Lab., TN (United States); California Univ., Los Angeles, CA (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ;W-7405-ENG-48 ;AC04-76DP00789 ;AC05-84OR21400 ;FG03-89ER51121. (CONF-930720–9: 20. European conference on controlled fusion and plasma physics, Lisbon (Portugal), 26-30 Jul 1993). Order Number DE93015477. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper we present the first results of divertor cryopumping experiments in the absence of biasing on DIII-D H-mode plasmas.

27994 (GA-A–21306) **Dependence of $\beta \cdot \tau$ on plasma shape in DIII-D.** Lazarus, E.A. (Oak Ridge National Lab., TN (United States)). General Atomics, San Diego, CA (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ;AC05-84OR21400. (CONF-930720–6: 20. European conference on controlled fusion and plasma physics, Lisbon (Portugal), 26-30 Jul 1993). Order Number DE93015473. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper we discuss the observed variation in plasma performance with plasma shape, in particular, we shall compare single and double null diverted plasmas. The product $\beta \cdot \tau$ has been used as a figure-of-merit for comparing different toroidal magnetic configurations. Here we shall use it as the figure-of-merit for comparing differing configurations within the DIII-D tokamak.

27995 (GA-A–21308) **The role of electric field shear stabilization of turbulence in the H-mode to VH-mode transition in DIII-D.** Burrell, K.H. (General Atomics, San Diego, CA (United

States)); Osborne, T.H.; Groebner, R.J.; Rettig, C.L. General Atomics, San Diego, CA (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-930720–7: 20. European conference on controlled fusion and plasma physics, Lisbon (Portugal), 26-30 Jul 1993). Order Number DE93015474. Source: OSTI; NTIS; INIS; GPO Dep.

Short communication. TURBULENCE/stabilization; H-MODE PLASMA CONFINEMENT/turbulence; DOUBLET-3 DEVICE; ELECTRIC FIELDS; SHEAR; TURBULENCE; STABILIZATION; ION TEMPERATURE; TIME DEPENDENCE; CONFINEMENT TIME; MOMENTUM TRANSFER

27996 (GA-A–21316) **Measurements of edge fluctuations by phase contrast imaging on DIII-D.** Coda, S. (Massachusetts Inst. of Tech., Cambridge, MA (United States)); Porkolab, M.; Burrell, K.H.; Carlstrom, T.N. General Atomics, San Diego, CA (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ;FG02-91ER54109. (CONF-930720–5: 20. European conference on controlled fusion and plasma physics, Lisbon (Portugal), 26-30 Jul 1993). Order Number DE93014018. Source: OSTI; NTIS; INIS; GPO Dep.

A novel imaging diagnostic for the investigation of edge plasma density fluctuations was recently installed on the DIII-D tokamak. The diagnostic, which is based on the Zernike phase contrast method, was developed in response to the need for spatially resolved, long wavelength fluctuation measurements. Unique features of this system include: Large bandwidth (100 MHz), high sensitivity ($\tilde{n}_e \simeq 10^9$ cm^{-3}), and absolute calibration capability. Initial results are presented on the fluctuation suppression at the L- to H-mode transition and on the bursts of turbulent activity which occur during ELMs.

27997 (IC–93/89) **Resonant absorption of Alfven waves near a neutral point.** Uberoi, C. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [10p.] Order Number DE93628761. Source: OSTI; NTIS (US Sales Only); INIS.

The resonant absorption of Alfven waves at the neutral point is discussed by using the existing mathematical theories of the Alfven wave equation both for ideal and resistive plasmas. It is found that in the case of ideal system the resonant phenomena of Alfven waves does not show any different behaviour near a finite or a zero singular point. In case of resistive plasma initially the evolution of the system in time proceeds without any difference from the ideal system till time $t \leq t_n$. When $t > t_n$, the high frequency surface waves are resonantly mode converted to the resistivity modified shear Alfven wave at non-zero singular points but at the neutral point the zero-frequency surface waves which are symmetrical surface modes of the structured neutral layer couple to the tearing mode of instability of the layer. The importance of this study to the energy balance in tearing modes and the association of surface waves to driven magnetic reconnection is also pointed out. (author). 11 refs.

27998 (INIS-mf–13545, pp. 122-128) **Cold fusion observation at gas-discharge device cathode.** Karabut, A.B. (Scientific Industrial Assocation "Lutch", Podolsk (Russian Federation)); Kucherov, Ya.R.; Savvatimova, I.B. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

The experimental results on cold fusion observation at glow discharge in deuterium are presented. Neutron fluxes up to 10^7 n/s were registered with various experimental methods (He_3-filled neutron detectors and by activation of silver foil). Heat release exceeding input electric energy by 20-50% was measured with a dynamic calorimeter. The heat surplus exceeds possible chemical reactions heat release in discharge chamber volume. The heat flow correlates with neutron flux magnitude. 3 refs.; 5 figs. (author).

27999 (IPPCZ–324) **Dynamic behaviour of an electric arc gas discharge.** Jenista, J. Ceskoslovenska Akademie Ved, Prague (Czech Republic). Ustav Fyziky Plazmatu. Aug 1992. [30p.] Order Number DE93630197. Source: OSTI; NTIS (US Sales Only); INIS.

The time-dependent energy and circuit equations are solved numerically to obtain temperature profiles, current-voltage characteristics and electric field strength vs axial temperature diagrams in the asymptotic region of a wall-stabilized electric arc operated in nitrogen. Dynamic current-voltage characteristics and transient phenomena of steady state formation during the spark ignition phase are studied. The arc time-constant for free decay is computed and compared with approximate analytical results. It is found that for fixed initial conditions, the arc response to the variable applied voltage is several times longer than the arc time-constant for free decay. (author) 4 figs., 11 refs.

28000 (IYaF–92-8) **Bulk plasma heating by a microsecond E-beam in the GOL-3 facility.** Burdakov, A.V. (and others); Voropaev, S.G.; Guber, A.F. AN SSSR, Novosibirsk (Russian Federation). Inst. Yademoj Fiziki. 1992. [27p.] (In Russian). Order Number DE93630186. Source: OSTI; NTIS (US Sales Only); INIS.

Experimental results on a 10^{15}cm^{-3} plasma heating by a microsecond electron beam at the GOL-3 device are presented. The beam of 100 kJ energy content was injected in the hydrogen plasma placed inside a 7-m-long solenoid with 5.5 T magnetic field. The experiments were emphasized on the studies of the bulk plasma heating by means of laser scattering technique and on the beam energy spectrum analysis after its passing the plasma. The decay of the plasma temperature after the beam injection and is discussed. 19 refs.; 16 figs.

28001 (JET-R–92-12) **Specification of a helium atom beam required for neutral particle analyzer and for charge exchange resonance spectroscopy applications in JET.** Gondhalekar, A. Commission of the European Communities, Abingdon (UK). JET Joint Undertaking. Nov 1992. [19p.] Order Number DE93630187. Source: OSTI; NTIS (US Sales Only); INIS.

An important concern in Deuterium-Tritium fusion α-particle heating physics in tokamak configuration is that the 3.5MeV ions will be lost before giving up all their energy to heat the plasma, in other words that the radial diffusion time of α-particles will be shorter than their slowing-down time in the plasma core, thus reducing effectiveness of α-particle heating. Spatially resolved measurements of slowing-down and radial transport of α-particles and other MeV energy ions in the plasma is a high priority diagnostic objective in the Joint European Torus Project (JET). To this end three experiments are in preparation at JET, a high energy Neutral Particle Analyzer (NPA) capable of measurement of α-particles of energy $0.5 \leq E_\alpha$ (MeV) ≤ 3.5, a Charge-Exchange Resonance Spectroscopy (CXRS) measurement, and a μ-wave scattering measurement. The NPA application utilizes a double charge-exchange (CX) reaction between an α-particle and a helium atom present in the plasma, while the CXRS relies on a single CX reaction with a hydrogenic or helium atom. The donor atoms needed for these reactions arise from recycling, or may be injected into the plasma as atom beams. In this paper I determine physical characteristics of a helium atom beam required for NPA and CXRS applications on JET, and what correspondence there is between these requirements and a standard JET PINI atom beam source. (Author).

28002 (JINR-E–15-92-315) **Novel approach to the determination of muon sticking to helium in the μCF reactions.** Fil'chenkov, V.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1992. [4p.] Order Number DE93630194. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Muon Catalyzed Fusion.

In this paper it is shown that the measurements of the multiplicity of the μCF events in a definite time interval makes it possible to distinguish the fusion events interrupted because of the muon sticking to the helium nucleus from those events which are stopped due to the muon decay. 9 refs.; 1 fig.

28003 (JINR-R–15-92-312) **Time distribution of multicycle mu-catalyzed events.** Zinov, V.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1992. [4p.] (In Russian). Order Number DE93630195. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Muon Catalyzed Fusion.

The paper draws attention to the fact that the time distribution of multicycle nuclear fusion events, initiated by an individual muon in

a mixture of hydrogen isotopes, essentially differs from the time distribution of the same events obtained after summation of the result over many muons. 1 ref.; 4 figs.

28004 (LA–12483-MS) **A PC-PCL-based control system for the high-voltage pulsed-power operation of the Intense Diagnostic Neutral Beam (IDNB) Experiment.** Gribble, R. Los Alamos National Lab., NM (United States). Jun 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93014144. Source: OSTI; NTIS; INIS; GPO Dep.

A stand-alone, semiautomated control system for the high-voltage pulsed-power energy sources on the Intense Diagnostic Neutral Beam Experiment at Los Alamos National Laboratory using personal computer (PC) and programmable logic controller (PLC) technology has been developed and implemented. The control system, consisting of a PC with the graphic operator interface, the network connecting the PC to the PLC, the PLC, the PLC I/O modules, fiber-optic interfaces and software, is described.

28005 (LA-UR–93-1318) **Instability heating of the HDZP.** Lovberg, R.H. (California Univ., San Diego, La Jolla, CA (United States)); Riley, R.A.; Shlachter, J.S. Los Alamos National Lab., NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304126–5: 3. international conference on dense z-pinches, London (United Kingdom), 19-23 Apr 1993). Order Number DE93012641. Source: OSTI; NTIS; INIS; GPO Dep.

We present a model of dense Z-Pinch heating. For pinches of sufficiently small diameter and high current, direct ion heating by m=0 instabilities becomes the principal channel for power input. This process is particularly important in the present generation of dense micro-pinches (e.g., HDZP-II) where instability growth times are much smaller than current risetimes, and a typical pinch diameter is several orders smaller than that of the chamber. Under these conditions, m=0 formation is not disruptive: the large E_z field reconnects the instability cusps externally, after which the ingested magnetic flux decays into turbulent kinetic energy of the plasma. The continuous process is analogous to boiling of a heated fluid. A simple analysis shows that an equivalent resistance $R_t = \ell / 4\sqrt{N m_i (\mu_0/\pi)^{3/2}} I/r$ appears in the driving circuit, where I is the pinch current, N is the line density, ℓ is the pinch length, m_i is the ion mass, and r is the pinch radius. A corresponding heating term has been added to the ion energy equation in a 0-D, self-similar simulation, which had been written previously to estimate fusion yields and radial expansion of D_2 fiber pinches. The simulation results agree well with the experimental results from HDZP-II, where the assumption of only joule heating produced gross disagreement. Turbulent ion heating should be the dominant process in any simple pinch carrying meg-ampere current and having submillimeter radius.

28006 (LA-UR–93-1564) **The status of "Cold Fusion".** Storms, E. Los Alamos National Lab., NM (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930804–1: 28. intersociety energy conversion engineering conference, Atlanta, GA (United States), 8-13 Aug 1993). Order Number DE93012731. Source: OSTI; NTIS; INIS; GPO Dep.

This report attempts to update the status of the phenomenon of cold fusion.

28007 (NIFS–194) **Eigenfunction for dissipative dynamics operator and attractor of dissipative structure.** Kondoh, Yoshiomi (Gunma Univ., Kiryu (Japan). Faculty of Technology). National Inst. for Fusion Science, Nagoya (Japan). Oct 1992. 14p. Order Number DE93508160. Source: OSTI; NTIS; INIS.

It is shown that the states with the minimum dissipation rate in general dissipative dynamics systems are expressed by the eigenfunctions for the dissipative dynamics operators. The eigenfunctions for the dissipative dynamics operators are shown to constitute the self-organized and self-similar decay phase as the attractor of the dissipative structure. (author).

28008 (NIFS–204) **Two-stream instability for a light ion beam-plasma system with external magnetic field.** Okada, T. (Tokyo Univ. of Agriculture and Technology, Koganei (Japan). Faculty of Technology); Tazawa, H. National Inst. for Fusion Science, Nagoya (Japan). Dec 1992. 14p. Order Number DE93508331. Source: OSTI; NTIS; INIS.

For inertial confinement fusion, a focused light ion beam (LIB) is required to propagate stably through a chamber to a target. We have pointed out that the applied external magnetic field is important for LIB propagation. To investigate the influence of the external magnetic field on the LIB propagation, we analysed the electrostatic dispersion relation of magnetized light ion beam-plasma system. The particle in-cell (PIC) simulation results are presented for a light ion beam-plasma system with external magnetic field. (author).

28009 (NIFS–206) **Tracking sharp interface of two fluids by the CIP (cubic-interpolated propagation) scheme.** Yabe, T. (Gunma Univ., Kiryu (Japan). Faculty of Technology); Xiao, F. National Inst. for Fusion Science, Nagoya (Japan). Jan 1993. 19p. Order Number DE93508322. Source: OSTI; NTIS; INIS.

A method to treat a sharp discontinuity by the density function is proposed. The surface of the density function is described by one grid throughout the calculation even when the surface is largely distorted. This description is made possible by the CIP method combined with variable transformation. This scheme is applied to the linear wave propagation in one- and two-dimensions. In the nonlinear case, the injection of heavier fluid into lighter fluid his calculated and the winding of mushroom structure is successfully treated by the density function. (author).

28010 (NIFS–207) **Simulation study of MHD dynamo: Convection in a rotating spherical shell.** Kageyama, A. (Hiroshima Univ. (Japan). Faculty of Science); Watanabe, K.; Sato, T. National Inst. for Fusion Science, Nagoya (Japan). Feb 1993. 46p. Order Number DE93508323. Source: OSTI; NTIS; INIS.

Numerical simulations on the thermal convection of a neutral fluid (without the magnetic field) in a rotating spherical shell have been carried out. The results indicate that if the rotation is sufficiently rapid, the fluid results in a strong differential rotation where an equatorial acceleration is remarkable. The formation dynamics of convection columns aligned to the rotation axis is studied extensively. A new model of generation mechanism of the differential rotation is then proposed which concludes that the fluid motion generates an equatorial acceleration by selectively exciting the cyclonic columns in the spherical shell. (author).

28011 (NIFS–208) **Plasma heating in toroidal systems.** Okamoto, Masao; Murakami, Sadayoshi. National Inst. for Fusion Science, Nagoya (Japan). Feb 1993. 17p. Order Number DE93508324. Source: OSTI; NTIS; INIS.

The purpose of this paper is to review the present status of plasma heating in toroidal systems (mainly tokamaks and helical systems) for astrophysical plasma scientists. The main method of plasma heating in toroidal systems or tori is to utilize fast ions (NBI heating and alpha heating). The maximum ion temperature of 38 keV has been achieved at the plasma center by neutral beam injections (NBIs) in the JT-60U tokamak. Ripple-trapped losses of fast ions produced by NBIs have been measured also in the JT-60U. The first tokamak discharges in deuterium-tritium fuelled mixtures have been carried out successfully in the JET tokamak. These experimental results are compared with the theoretical predictions based on the Coulomb collisions. Another powerful method is the ICRF heating (Ion Cyclotron Range of Frequency). However, this article will be focussed mainly on the NBI and alpha heatings. Related to plasma heating the current drive will be mentioned briefly placing an emphasis on the bootstrap current. (author).

28012 (NIFS–209) **Density dependence of line intensities and application to plasma diagnostics.** Masai, Kuniaki. National Inst. for Fusion Science, Nagoya (Japan). Feb 1993. 26p. Order Number DE93508325. Source: OSTI; NTIS; INIS.

Electron density dependence of spectral lines are discussed in view of application to density diagnostics of plasmas. The dependence arises from competitive level population processes, radiative and collisional transitions from the excited states. Results of the measurement on tokamak plasmas are presented to demonstrate the usefulness of line intensity ratios for density diagnostics. Also

general characteristics related to density dependence are discussed with atomic-number scaling for H-like and He-like systems to be helpful for application to higher density plasmas. (author).

28013 (NIFS–210) **R and D of transmission lines for ECH system.** Ohkubo, K.; Hosokawa, M.; Kubo, S.; Sato, M.; Takita, Y.; Kuroda, T. National Inst. for Fusion Science, Nagoya (Japan). Feb 1993. 21p. Order Number DE93508330. Source: OSTI; NTIS; INIS.

The performance of oversized transmission elements for millimeter waves is measured and compared with the calculation which is based on the superposition of plane wave (SPW) and on Fresnel approximation in the Huygens-Kirchhoff integral. Mode-conversion in the split waveguide is discussed from the viewpoint of on- and off-axes and 90-degrees elbow bend on phase correction is examined by using the SPW method. The design and experiment on the whispering gallery mode generator are described. A preliminary analysis of the rectangular waveguide with two corrugated plates and two plane walls is also carried out to obtain the Gaussian beam with a waist size of x-axis different from that of y-axis. (author).

28014 (NIFS–211) **Some features of particle orbit behavior in LHD configurations.** Shishkin, A.A.; Watanabe, K.Y.; Yamazaki, K.; Motojima, O.; Grekov, D.L.; Smirnova, M.S.; Zolotukhin, A.V. National Inst. for Fusion Science, Nagoya (Japan). Mar 1993. 50p. Order Number DE93508326. Source: OSTI; NTIS; INIS.

Localizations of helically trapped particle losses on the last closed magnetic surface in different LHD configurations are studied. The effects of electric field, finite β and bootstrap current are taken into account. It is shown that the angular location of the helically trapped particle losses may be controlled by the change of vertical field coil currents. (author).

28015 (NIFS–212) **Demonstration for novel self-organization theory by three-dimensional magnetohydrodynamic simulation.** Kondoh, Yoshiomi (Gunma Univ., Kiryu (Japan). Faculty of Technology); Hosaka, Yasuo; Liang, Jia-Ling. National Inst. for Fusion Science, Nagoya (Japan). Mar 1993. 21p. Order Number DE93508327. Source: OSTI; NTIS; INIS.

It is demonstrated by three-dimensional simulations for resistive magnetohydrodynamic (MHD) plasmas with both 'spatially nonuniform resistivity η' and 'uniformη' that the attractor of the dissipative structure in the resistive MHD plasmas is given by $\nabla \times (\eta j) = (\alpha/2)B$ which is derived from a novel self-organization theory based on the minimum dissipation rate profile. It is shown by the simulations that the attractor is reduced to $\nabla \times B = \lambda B$ in the special case with the 'uniformη' and no pressure gradient. (author).

28016 (NIFS–213) **Thermal and electric oscillation driven by orbit loss in helical systems.** Itoh, K.; Sanuki, H.; Itoh, S. National Inst. for Fusion Science, Nagoya (Japan). Mar 1993. 22p. Order Number DE93508328. Source: OSTI; NTIS; INIS.

Coupled oscillation of the radial electric field, the heating power and the plasma temperature in helical systems is analysed. This oscillation is caused by the influence of the radial electric field on the direct loss of injected fast ions. The damped oscillations of the radial electric field, temperature and fast-ion loss are predicted. Conditions for the mode and the dependence of the frequency are discussed. (author).

28017 (NIFS–214) **Effect of continuous eigenvalue spectrum on plasma transport in toroidal systems.** Yamagishi, Tomejiro (Fukui Inst. of Tech. (Japan)). National Inst. for Fusion Science, Nagoya (Japan). Mar 1993. 25p. Order Number DE93508329. Source: OSTI; NTIS; INIS.

The effect of the continuous eigenvalue of the Vlasov equation on the cross field ion thermal flux is investigated. The continuum contribution due to the toroidal drift resonance is found to play an important role in ion transport particularly near the edge, which may apply to the interpretation of the sharp increase of ion heat conductivity near the periphery observed in large tokamaks. (author).

28018 (NIFS-MEMO–7) **Chaotic phenomena in plasma, 2.** Kawai, Y. (ed.) (Kyushu Univ., Fukuoka (Japan)). National Inst. for Fusion Science, Nagoya (Japan). Nov 1992. 62p. (In Japanese). Order Number DE93508286. Source: OSTI; NTIS; INIS.

To review the present status of the research on plasma chaos, a working group was organized in 1990. The second meeting of the working group was held on December 1991 at National Institute for Fusion Science. This is the report of the second meeting, which contains both experimental and theoretical works. (author).

28019 (PPPL–2900) **Investigation of electrostatic waves in the ion cyclotron range of frequencies in L-4 and ACT-1.** Ono, Masayuki. Princeton Univ., NJ (United States). Plasma Physics Lab. May 1993. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE93014592. Source: OSTI; NTIS; INIS; GPO Dep.

Electrostatic waves in the ion cyclotron range of frequencies (ICRF) were studied in the Princeton L-4 and ACT-1 devices for approximately ten years, from 1975 to 1985. The investigation began in the L-4 linear device, looking for the parametric excitation of electrostatic ion cyclotron waves in multi-ion-species plasmas. In addition, this investigation verified multi-ion-species effects on the electrostatic ion cyclotron wave dispersion religion including the ion-ion hybrid resonance. Finite-Larmor-radius modification of the wave dispersion relation was also observed, even for ion temperatures of $T_i \approx 1/40$ eV. Taking advantage of the relatively high field and long device length of L-4, the existence of the cold electrostatic ion cyclotron wave (CES ICW) was verified. With the arrival of the ACT-1 toroidal device, finite-Larmor-radius (FLR) waves were studied in a relatively collisionless warm-ion hydrogen plasma. Detailed investigations of ion Bernstein waves (IBW) included the verification of mode-transformation in their launching, their wave propagation characteristics, their absorption, and the resulting ion heating. This basic physics activity played a crucial role in developing a new reactor heating concept termed ion Bernstein wave heating. Experimental research in the lower hybrid frequency range confirmed the existence of FLR effects near the lower hybrid resonance, predicted by Stix in 1965. In a neon plasma with a carefully placed phased wave exciter, the neutralized ion Bernstein wave was observed for the first time. Using a fastwave ICRF antenna, two parasitic excitation processes for IBW – parametric instability and density-gradient-driven excitation – were also discovered. In the concluding section of this paper, a possible application of externally launched electrostatic waves is suggested for helium ash removal from fusion reactor plasmas.

28020 (PPPL–2905) **Experimental exploration of profile control in the Princeton Beta Experiment-Modified (PBX-M) tokamak.** Bernabei, S.; Bell, R.; Chance, M.; Chu, T.K.; Corneliussen, M.; Davis, W.; Gettelfinger, G.; Gibney, T.; Greenough, N.; Hatcher, R.; Hermann, H.; Ignat, D.; Jardin, S.; Kaita, R.; Kaye, S.; Kessel, C.; Kozub, T.; Hugel, H.; Lagin, L.; LeBlanc, B.; ManickaPrinceton Univ., NJ (United States). Plasma Physics Lab. May 1993. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE93014818. Source: OSTI; NTIS; INIS; GPO Dep.

The experimental program of the Princeton Beta Experiment-Modified (PBX-M) Tokamak is directed towards tailoring plasma profiles to achieve greater stability and confinement and to gain access to the second stability region. Modification of the current density profile has been achieved with lower hybrid current drive (LHCD), leading to a regime free of global magnetohydrodynamic modes, while raising the value of q(O) above unity. The diffusion of the fast electrons produced by LHCD has been examined using two dimensional hard x-ray imaging. Ion Bernstein waves (IBW) have been used for ion heating: a preliminary analysis shows that ion heating was spatially localized and in agreement with theoretical calculations. Divertor biasing has modified the electric field inside the last closed surface, resulting in the formation of a transport barrier, which in turn has reduced the threshold power of Neutral Beam Injection (NBI) for H-mode transition by 25%.

28021 (PPPL–2906) **Numerical simulation of Bootstrap Current.** Wu, Yanlin; White, R.B. Princeton Univ., NJ (United States). Plasma Physics Lab. May 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE93014596. Source: OSTI; NTIS; INIS; GPO Dep.

The neoclassical theory of Bootstrap Current in toroidal systems is calculated in magnetic flux coordinates and confirmed by numerical simulation. The effects of magnetic ripple, loop voltage, and magnetic and electrostatic perturbations on bootstrap current for the

cases of zero and finite plasma pressure are studied. The numerical results are in reasonable agreement with analytical estimates.

28022 (PPPL–2907) **Theory of kinetic ballooning modes excited by energetic particles in tokamaks.** Tsai, Shih-Tung; Chen, Liu. Princeton Univ., NJ (United States). Plasma Physics Lab. May 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE93014597. Source: OSTI; NTIS; INIS; GPO Dep.

We have analyzed theoretically the resonant excitations of kinetic ballooning modes (KBM) by the energetic ions/alpha particles in tokamaks. Our theory includes finite-size orbit effects of both circulating and trapped particles. With energetic-particle contributions suppressed in the singular inertial layer, an analytic.dispersion relation can then be derived via an asymptotic matching analysis. The dispersion relation, in particular, demonstrates the existence of two types of modes; that is, the magnetohydrodynamic (MHD) gap mode and the energetic-particle continuum mode. Specific expressions for real frequencies, growth rates and threshold conditions are also derived for a model slowing-down beam ion distribution function.

28023 (PPPL–2913) **Fast wave direct electron heating in TFTR.** Murakami, M.; Jaeger, E.F.; Rimini, F.G.; Rasmussen, D.A.; Stevens, J.E.; Wilson, J.R.; Batchelor, D.B.; Bell, M.; Budny, R.; Fredrickson, E.; Goldfinger, R.C.; Hammett, G.; Hoffman, D.J.; Hosea, J.C.; Janos, A.; Majeski, R.; Mansfield, D.; Phillips, C.K.;Princeton Univ., NJ (United States). Plasma Physics Lab. May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (CONF-9304112–16: 10. topical conference on radio frequency power in plasmas, Boston, MA (United States), 1-3 Apr 1993). Order Number DE93014820. Source: OSTI; NTIS; INIS; GPO Dep.

Direct electron heating experiments were carried out in two regimes: B_T = 4.6 T with D^+ supershots; and B_T = 2.3 T with ^3He majority. The electron power deposition profiles measured with modulation of RF power are found to be strongly peaked in the core with the total volume-integrated power of up to 80% of the modulated power. The magnitude and profile shape agree well with those predicted by a full-wave code.

28024 (UCRL-CR–111879) **Long-pulse operation of a gyrotron with beam/rf separation.** Felch, K. (Varian Associates, Inc., Palo Alto, CA (US)); Chu, T.S.; Feinstein, J.; Huey, H.; Jory, H.; Neilson, J.; Schumacher, R. Lawrence Livermore National Lab., CA (United States); Varian Associates, Inc., Palo Alto, CA (United States). Sep 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93015007. Source: OSTI; NTIS; INIS; GPO Dep.

Varian is carrying out the development of high-power, cw gyrotrons at frequencies ranging from 85–140 GHz. An experimental tube employing a $TE_{22.2.1}$-mode cavity and utilizing an output coupling concept where the collection of the spent electron beam is separated from the outgoing microwave power, has been designed and constructed. In initial tests on the tube, output powers of 450–500 kW have been obtained for pulse durations out to 2.5 seconds, in the desired $TE_{22.2.1}$ mode at a frequency of 110 GHz. Electron cyclotron resonance heating (ECRH) requirements for planned magnetic fusion experiments such as the International Thermonuclear Experimental Reactor (ITER) will require millimeter-wave sources capable of output powers of at least 1 MW cw at frequencies in the range, 100–200 GHz. Initial megawatt-level development work at Varian resulted in a gyrotron design that was tested to output powers of 1 MW for short pulses (~1 ms) and 400 kW for 0.5-s pulses at a frequency of 140 GHz. Output powers up to 1 MW have been achieved for short pulses (1 ms). Future tests on this and subsequent experimental tubes will be aimed at achieving 1 MW power levels under long-pulse and ultimately, cw conditions.

28025 (UCRL-JC–110953) **Kinetic simulations of ultra-intense laser plasma interactions.** Kruer, W.L.; Wilks, S.C. Lawrence Livermore National Lab., CA (United States). Jun 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9206359–1: International conference on plasma physics (ICPP) - joint conference of the 9. Kiev international conference on plasma theory and the 9. international congress on waves and stabilities in plasma (ICWI, Innsbruck (Austria), 29 Jun - 3 jul Order Number DE93014419. Source: OSTI; NTIS; GPO Dep.

Kinetic simulations are used to investigate the interaction of an ultra-intense, small spot-size laser beam with a preformed plasma. the beam is sufficiently intense to drive the electrons relativistically and to impart a pressure in excess of hundreds of Mbars to the plasma. Key features of the interaction include generation of electrons and inward-directed ions with energies in the Mev range and strong hole boring which enhances the absorption. The simulations also show self-generated magnetic fields of order 10^8 Gauss, a Rayleigh-Taylor like instability of the light-plasma interface, as well as self-focusing of the laser beam and strong Raman backscatter.

28026 (UCRL-JC–111405) **Magnetic fusion computing: A personal retrospective view.** Killeen, J. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). Aug 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920813–3: Joint Varenna-Lausanne international workshop on theory of fusion plasmas, Varenna (Italy), 24-28 Aug 1992). Order Number DE93014147. Source: OSTI; NTIS; GPO Dep.

The association of computing with magnetic fusion research has a history of more than 30 years. Then, as now, the mathematical complexity of describing plasma phenomena has made the computer an indispensable tool in extending the theory. Our first area of application addressed fluid MHD models to represent ideal and resistive plasmas as well as equilibria. A second equally important area of research was in the solution of kinetic plasma models. Both Vlasov and Fokker-Planck models have been solved in the codes we developed, the latter allowing us to make realistic estimates of the transport of heat and particles in reacting fusion plasmas. The critical importance of computing to plasma physics research led us to the development of the dedicated computing facilities at NERSC (National Energy Research Supercomputer Center, Livermore). Aspects of these theoretical and institutional developments will be presented in a historical retrospective view.

28027 (UCRL-JC–111546) **Parametric instabilities in large nonuniform laser plasmas.** Baldis, H.A. (Lawrence Livermore National Lab., CA (United States)); Montgomery, D.S.; Moody, J.D.; Estabrook, K.G.; Berger, R.L.; Kruer, W.L.; Labaune, C.; Batha, S.H. Lawrence Livermore National Lab., CA (United States). Sep 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920610–16: ICPP 92: International conference on plasma physics, Innsbruck (Austria), 29 Jun - 3 jul 1992). Order Number DE93013184. Source: OSTI; NTIS; GPO Dep.

The study of parametric instabilities in laser plasmas is of vital importance for inertial confinement fusion (ICF). The long scale-length plasma encountered in the corona of an ICF target provides ideal conditions for the growth of instabilities such as stimulated Brillouin scattering (SBS), stimulated Raman scattering (SRS), and filamentation. These instabilities can have detrimental effects in ICF and their characterization and understanding is of importance. Scattering instabilities are driven through a feedback loop by which the beating between the electromagnetic EM fields of the laser and the scattered light matches the frequency of a local longitudinal mode of the plasma. Any process which interferes with the coherence of this mechanism can substantially alter the behavior of the instability. Of particular interest is the study of laser beam smoothing techniques on parametric instabilities. These techniques are used to improve irradiation uniformity which can suppress hydrodynamic instabilities. Laser beam smoothing techniques have the potential to control the scattering level from parametric instabilities since they provide not only a smoother laser intensity distribution, but also reduced coherence. Beam smoothing techniques that affect the growth of parametric instabilities include spatial smoothing and temporal smoothing by laser bandwidth. Spatial smoothing modifies the phase fronts and temporal distribution of intensities in the focal volume. The transverse intensity spectrum is shifted towards higher spatial wavenumber and can significantly limit the growth of filamentation. Temporal smoothing reduces the coherence time and consequently limits the growth time. Laser

bandwidth is required for most smoothing techniques, and can have an independent effect on the instabilities as well.

28028 (UCRL-JC–112154) **Charged-particle evaluation methodology at LLNL.** Resler, D.A.; White, R.M. Lawrence Livermore National Lab., CA (United States). Oct 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921046–18: Symposium on nuclear data evaluation methodology, Upton, NY (United States), 12-16 Oct 1992). Order Number DE93013429. Source: OSTI; NTIS; GPO Dep.

We recently completed charged-particle evaluations for reactions of hydrogen and helium important to fusion applications. In this paper we emphasize the methods developed which are unique to the evaluation of low-energy charged-particle data. In addition, we discuss general methods we developed to eliminate some of the tedious aspects of data evaluation such as the extraction of numerical values from graphs when tabulated experimental data are unavailable. We also discuss software tools developed for visualization of experimental data and to construct curves using a computer mouse or a variety of least-squares techniques ranging from simple polynomial and cubic-spline fits to R-matrix analyses.

28029 (UCRL-JC–112302) **Implicit multi-fluid simulation of interpenetrating plasmas.** Rambo, P.W.; Denavit, J. Lawrence Livermore National Lab., CA (United States). 3 Nov 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9211128–8: 1992 nuclear explosives code developers conference, Sunnyvale, CA (United States), 2-6 Nov 1992). Order Number DE93013351. Source: OSTI; NTIS; INIS; GPO Dep.

A one dimensional simulation code for interpenetrating multicomponent plasmas is presented. Separate fluid equations for multiple species and the Poisson equation for the electric field are solved implicitly to allow stable accurate solutions over a wide range of the time scale parameters $\omega_p\Delta t$ and $\nu_c\Delta t$ (ω^p is the plasma frequency, ν_c a typical collision frequency and Δt the time step). In regions where $\omega_p\Delta t<<1$ and $\nu_c\Delta t<<1$, electron dynamics and space-charge effects are resolved, while in regions where $\omega_p\Delta t >>1$ and/or $\nu_c\Delta t>>1$, the ambipolar and/or diffusion models are recovered. In regions of low collisionality, particles may be created and deleted which are followed using particle and cell techniques combined with scatter and drag due to collisions with the fluids. Applications of this code to interpenetrating laser generated plasmas are presented.

28030 (BNL–48642) **Nuclear fusion of protons with ions of boron.** Ruggiero, A.G. Brookhaven National Lab., Upton, NY (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9305136–1: International symposium on heavy ion fusion, Frascati (Italy), 25-28 May 1993). Order Number DE93015399. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes a method of extracting energy from the fusion events occurring between the collision of a beam of protons with a beam of ions of Boron 11. The two beams are circulating in separated and intersecting storage rings where they collide head-on in a common long-straight section. Requirements on the beam parameters in the collider are presented. Limitations due to space-charge forces are discussed; it is found necessary to provide beam-charge neutralization with electrons. The paper discusses also the effects of Coulomb scattering between particles of the same beam and in the opposing beams. Methods are proposed for the controlling of the electromagnetic interaction.

28031 (CEA-CONF–11304) **Experimental validation of Pd-Ag diffuser modeling.** Chabot, J.; Sannier, J. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1992. [5p.] (CONF-920930–: 17. symposium on fusion technology, Rome (Italy), 14-18 Sep 1992). Order Number DE93632041. Source: OSTI; NTIS (US Sales Only); INIS.

In a nuclear fusion reactor the exhaust gas emanating from the plasma has to be reprocessed in order to separate hydrogen isotopes from impurities before recycling the DT mixture into the machine and releasing the gaseous wastes into the atmosphere. A favoured technique for the removing of the free deuterium and tritium is diffusion through Pd-alloy membranes. This process is well known but existing permeators are not really well adapted to NET operating conditions. In particular, the membrane geometry and the permeator configuration which can strongly affect permeator performances have to be optimized by considering NET specific requirements. Tubular finger Pd-Ag membranes of 1.35 to 5 mm diameter, 190 to 690 mm length and 0.1 mm thickness, have been tested comparatively in PALLAS II loop in order to determine their efficiency to hydrogen permeation as a function of length, diameter and cell annular space. Experiments were carried out at 300 deg C using a H_2-He gaseous mixture containing 5 vol% He under a pressure of 1.1 bar. For each membrane, the permeated hydrogen flow rate and the hydrogen concentration in the bleed were determined as a function of the bleed flow rate. Results illustrate the large dependence of performances to diameter and length whereas the influence of the annular space cell diameter appears to be small. However, for diameters $\geq$ 2.5 mm, the efficiency becomes diameter independent. Two membranes of 2.5 and 5 mm diameter and 690 mm long have been demonstrated as the more effective.

28032 (CONF-921103–13-App.C) **Burn control by refueling: Appendix C.** Hui, W.; Miley, G.H. Illinois Univ., Urbana, IL (United States). [1992]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER54092. From Meeting of the Division of Plasma Physics of the American Physical Society; Seattle, WA (United States); 16-20 Nov 1992. Order Number DE93013489. Source: OSTI; NTIS; INIS; GPO Dep.

This report construct the simplest model for describing the control of plasma burn with refueling.

28033 (CONF-9304112–13) **Folded waveguide designs for tokamaks.** Hoffman, D.J. (Oak Ridge National Lab., TN (United States)); Bigelow, T.S.; Fogelman, C.H.; Yugo, J.J.; Caughman, J.B.O.; Gardner, W.L.; Carter, M.D.; Probert, P.H.; Barbato, E. Oak Ridge National Lab., TN (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. topical conference on radio frequency power in plasmas; Boston, MA (United States); 1-3 Apr 1993. Order Number DE93013274. Source: OSTI; NTIS; INIS; GPO Dep.

The folded waveguide (FWG) has been tested to the megawatt level in RFTF and shows great promise for tokamak use. It has three primary advantages: low electric field (anywhere) per unit power coupled to the plasma, strong structural capabilities, and better spectral content than loops. A tokamak test is now needed. Potential candidates include C-Mod at 80 MHz and FTU at 433 MHz. The waveguide test on the first machine will be directed at conventional ion cyclotron heating, while the test on the latter will be directed at direct electron heating. In addition, a variation of the folded waveguide is proposed to be tested on Phaedrus-T. In this paper, we discuss the advantages of the waveguide, the design layout, some of the potential physics programs, and how these programs may have an impact on its potential use in ITER.

28034 (CONF-9304112–17) **A preliminary engineering assessment of the ITER CDA ECH launcher.** Bigelow, T.S. (Oak Ridge National Lab., TN (US)); Swain, D.W.; Sawan, M. Oak Ridge National Lab., TN (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. topical conference on radio frequency power in plasmas; Boston, MA (United States); 1-3 Apr 1993. Order Number DE93015441. Source: OSTI; NTIS; INIS; GPO Dep.

A preliminary engineering study of the ITER electron cyclotron heating (ECH) launcher configuration proposed by the ITER Conceptual Design Activity (CDA) team has been performed to assess its survivability in the ITER nuclear environment. Potential problem areas are with the vacuum windows, the plasma-facing mirrors, and some of the other high-power waveguide components that are untested in a reactor environment. The study indicates that the

CDA design is quite robust, since the mirror power density is relatively low and the windows are well shielded. Although the CDA ECH system is unlikely to be built as proposed, most analysis techniques developed to study this system will apply to future ITER ECH system configurations. The vacuum window is likely to be the most difficult launcher component to develop. Design for a proposed resonant ring for high-power testing of windows using existing lower-power gyrotrons is presented.

28035 (DOE/ER-ITER–0004) **International Thermonuclear Experimental Reactor.** USDOE Office of Energy Research, Washington, DC (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;AC05-84OR21400 ;AC02-76CH03073. Order Number DE93014828. Source: OSTI; NTIS; INIS; GPO Dep.

This is a general overview pamphlet on the ITER tokamak.

28036 (DOE/FTR–93011400) **[Travel to France to the IAEA technical committee meeting on atomic and molecular data for fusion reactor technology]: Foreign trip report, October 9–18, 1992.** Wilson, K.L. Sandia National Labs., Livermore, CA (United States). 1992. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DR00789. Order Number DE93011400. Source: OSTI; NTIS (US Sales Only); GPO Dep.

K. L. Wilson participated in the IAEA Technical Committee Meeting on Atomic and Molecular Data for Fusion Reactor Technology held in Cadarache, France on October 12–16, 1992. In this meeting he gave two invited talks and served as a co-chair of the Plasma-Surface Interaction Data Working Group. Following the meeting, he participated in the International Fusion Research Council (IFRC) subcommittee on Atomic and Plasma-Material Interaction Data for fusion meeting held on October 16–17, 1992, at Cadarache.

28037 (DOE/FTR–93014983) **Travel to England to conduct an informal meeting of designated director and deputy directors for ITER: Foreign trip report, February 16, 1992–February 20, 1992.** Parker, R. Massachusetts Inst. of Tech., Cambridge, MA (United States). 16 Apr 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER54110. Order Number DE93014983. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses planning schedules; design and development; senior positions; and start-up for the ITER tokamak.

28038 (ENEA-RT-INN–92-37) **Materials for structural and functional components in fission and fusion nuclear power reactors.** Casadio, S. ENEA, Casaccia (Italy). Area Energia e Innovazione. Dec 1992. 30p. (RT/INN–92-37). Order Number DE93799227. Source: OSTI; NTIS (US Sales Only); INIS.

In this work, a fast 'dolly shot' is reported about the criteria by which some materials have been candidated to be used for structural components and for nuclear-physico-chemical functions for fission and fusion power reactors. For the latter (which do not yet exist), new materials have to be developed for withstanding the very hard envisaged environmental operating conditions.

28039 (ENEA-RTI-PCM-IFEC–92-06) **Diffusion bonding as joining technique for fusion reactor components.** Ceccotti, G.C.; Magnoli, L. ENEA, Saluggia (Italy). Area Nucleare. Nov 1992. 11p. (CONF-920930–17: 17. symposium on fusion technology, Rome (Italy), 14-18 Sep 1992). Order Number DE93799234. Source: OSTI; NTIS (US Sales Only); INIS.

The development of joining techniques for fusion reactor divertors has been undertaken at ENEA (Italian Agency for Energy, New Technologies and the Environment) IFEC Saluggia. Joints were made by the diffusion bonding technique between graphite composite material with DS copper and with molybdenum TZM alloy, respectively. The inter-layers, when necessary, were obtained by metallization with an electronic gun. The same technique is employed in joining Be/SS, DS copper/Be, TZM/Be and graphite/Be for the first wall or plasma facing components of fusion reactors. In this case, a suitable inter-layer material can avoid the problems occuring with the more traditional brazing processes.

28040 (ENEA-RT-NUCL–91-06) **Elastic-plastic bucking analysis of TJ-II heliac device vacuum vessel.** Pizzuto, A.; Riccardi, B. ENEA, Frascati (Italy). Dipt. Fusione. Mar 1991. 8p. (CONF-910817–34: 11. international conference on structural mechanics in reactor technology (SMIRT-11), Tokyo (Japan), 18-23 Aug 1991; RT/NUCL–91-06). Order Number DE93799307. Source: OSTI; NTIS (US Sales Only); INIS.

The TJ II heliac device is a stellarator proposed for construction in Madrid by the Spanish Euratom-Ciemat Association. It is a medium sized heliac axis stellarator with four periods, a major radius of 1.5 m, a toroidal magnetic field up to 1 T, and a duty cycle up to 1s every five minutes. The parameters of the TJ II machine are reported in this paper. A very wide range of magnetic configurations with high rotational transform (0.9 to 2.5), low shear (1% to 10%), deep magnetic well (0 to 6%) and an average plasma radius between 0.1 and 0.2 m will be produced. The Vacuum Vessel (VV) is an independent component fixed on the machine supports. It is designed to follow the shape of the plasma, which consists of a helical column turned four times around a radius of 1.5 m. The VV is composed of 32 sectors and 32 rings (10 mm thick) in AISI 304 LN stainless steel to assure very low magnetic permeability values (less than 1.01). In order to place the central conductor coils as close as possible to the plasma, keeping them out-side the VV, a concave helical surface, or groove (6 mm thick) was provided. The VV is of modular construction and composed of eight octants and eight key rings to be assembled on site by means of bolts and then welded to ensure vacuum tightness. Each octant consists of four sectors and three rings: flanges at the ends allow the connections.

28041 (ENEA-RT-NUCL–91-08, pp. 10-14) **Properties of ablation cloud surrounding solid hydrogen pellets injected in tokamaks.** McNeill, D.H. ENEA, Frascati (Italy). Apr 1991. (CONF-910711–Exc.: 20. international conference on phenomena in ionized gases, Barga (Italy), 8-12 Jul 1991; RT/NUCL–91-08). In *Contributions to 20th international conference on phenomena in ionized gases.* 19p. Order Number DE93799235. Source: OSTI; NTIS (US Sales Only); INIS.

The injection of solid hydrogen pellets has been widely used for fuelling large fusion experiments. A variety of models have been developed for the ablation of pellets as they enter a hot plasma. Spectroscopic measurements have recently been made of the parameters of the luminous region surrounding pellets injected into tokamaks. These measurements have yielded electron densities n_e=1:3x10^{17} cm^{-3} and temperatures T_e=1.5:2 eV in the brightest region. This paper describes the results of some local thermodynamic equilibrium (LTE) model calculations based on the measured electron density and temperature that yield parameters such as the pressure, degree of ionization and dissociation of hydrogen, the density of the excited and ground states of hydrogen, and the intensities of continuum emission and three-body recombination in the luminous zone. These results can be used in estimating the rate of expansion of the ablation cloud and in analyzing the power balance of the ablation region. These problems are of general interest as an example of plasma-surface interactions in the extreme environment to which a pellet is subjected as well as, from the standpoint of understanding the physics of pellet fuelling.

28042 (ENEA-RT-NUCL–91-19) **Contributions to international conference of implications of new ICRP recommendations on radiation protection practice and interventions.** ENEA, Frascati (Italy). Dipt. Fusione. Oct 1991. 22p. (CONF-911105–Exc.: Symposium on implications of the new ICRP recommendations on radiological protection practices, Salamanca (Spain), 26-29 Nov 1991; RT/NUCL–91-19). Order Number DE93799291. Source: OSTI; NTIS (US Sales Only); INIS.

From the Contributions to the 'International Conference on Implications of the New ICRP Recommendations on Radiation Protection Practice and Interventions', separate abstracts were prepared for 2 papers which dealt with radiation protection for the Frascati neutron generator and for the NET (Next European Torus) and ITER (International Thermonuclear Experimental Reactor) experimental fusion reactor facilities. The papers examined planned radiation protection measures for these facilities in light of the occupational exposure safety provisions contained in the new ICRP (International Commission on Radiation Protection) recommendations.

28043 (ENEA-RT-NUCL–91-19, pp. 5-11) **Occupational radiation dose assessment process at research thermonuclear fusion plant.** Ciattaglia, S.; Lucci, F.; Sandri, S.; Cambi, G.; Cavallone, G. ENEA, Frascati (Italy). Oct 1991. (CONF-911105–Exc.: Symposium on implications of the new ICRP recommendations on radiological protection practices, Salamanca (Spain), 26-29 Nov 1991; RT/NUCL–91-19). In *Contributions to international conference of implications of new ICRP reccomandations on radiation protection practice and interventions.* 22p. Order Number DE93799291. Source: OSTI; NTIS (US Sales Only); INIS.

This paper presents the criteria adopted in order to evaluate the Occupational Radiation Exposure (ORE) during normal operation at a research thermonuclear fusion plants, like the Next European Torus (NET) or the International Tokamak Experimental Reactor (ITER), now in the design phase. The evaluation is part of the safety analysis process that has the purpose of permitting the optimization of protection, according to the basic recommendations of the ICRP. Direct irradiation, component and air activation and intake situations, as well as, number of workers, number of events and exposure time are considered. Accidental conditions and equipment failures are not considered unless they are due to events with high probability of occurrence so that such events might be expected during the life of the plant. Systems and components, whose location in the plant can affect radiological protection during maintenance and/or surveillance, are identified.

28044 (ENEA-RT-NUCL–91-22) **Development of beryllium bonds for plasma-facing components.** Franconi, E.; Ceccotti, G.C.; Magnoli, L. ENEA, Frascati (Italy). Dipt. Fusione; ENEA, Saluggia (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Oct 1991. 16p. (CONF-911111–42: 5. international conference on fusion reactor materials (ICFRM-5), Clearwater, FL (United States), 17-22 Nov 1991; RT/NUCL–91-22). Order Number DE93799308. Source: OSTI; NTIS (US Sales Only); INIS.

The use of graphite as a plasma facing surface is limited due to strong erosion produced by a combination of physical and chemical sputtering, self-sputtering and radiation enhanced sublimation. The most promising alternative material appears to be beryllium which offers a number of potential advantages over graphite: oxygen impurities abatement, reduced tritium retention and reduced sputtering erosion. The greatest advantage seems to be the rapid and economical repair of the surfaces by means of spray deposition. However, a number of questions remain to be answered concerning the use of beryllium in high power tokamaks. Foremost amongst these are melting of the facing during disruptions, controversial data on self-sputtering yields, neutron irradiation effects, high operational thermal stresses and potential safety problems. This paper focuses on the techniques used to bond beryllium to structural and heat sink materials, and the characterization of the bonding material obtained. In tests of Be bonding to stainless steel and copper by the use of brazing alloys, best results were obtained with a silver-copper eutectic alloy. It was noted that the high temperature capability of the materials prepared by this method is limited by the performance of the brazing alloys at the operating temperature. To avoid this problem, a joining process known as solid state reaction bonding is being developed.

28045 (ENEA-RT-NUCL–92-02) **Membrane separation technologies: Their application to fusion reactors fuel cycle.** Violante, V.; Basile, A.; Drioli, E. ENEA, Frascati (Italy). Dipt. Fusione; Calabria Univ., Arcavacata di Rende (Italy). Dec 1992. 18p. (RT/NUCL–92-02). Order Number DE93799304. Source: OSTI; NTIS (US Sales Only); INIS.

The future fusion reactor fuel is a mixture of deuterium and tritium. The deuterium is available by means of traditional separation technology. The tritium, on the contrary, must be produced by means of a nuclear reaction between neutrons and lithium atoms within the reactor breeder which could be a lithiated ceramic material or a liquid metal containing lithium. The tritium produced in the breeder needs a proper extraction process to reach the required purity level. A conceptual modified version of the tritium recovery plant for a solid ceramic breeder, working with two membrane reaction/separation units, is studied in this work. The first membrane unit considered is a catalytic ceramic membrane reactor to remove, via oxidation, the hydrogen isotopes from the purge gas (He); the second is a Pd/Ag membrane permeator to separate the hydrogen isotopes from the watershift reactor gaseous products. The modelling and the mass balances were obtained on the basis of literature data.

28046 (ENEA-RT-NUCL–92-12) **Contributions to 10th international conference on plasma surface interactions.** ENEA, Frascati (Italy). Dipt. Fusione. May 1992. 42p. (CONF-920311–Exc.: 10. international conference on plasma-surface interactions in controlled fusion devices, Monterey, CA (United States), 30 Mar - 3 apr 1992; RT/NUCL–92-12). Order Number DE93799249. Source: OSTI; NTIS (US Sales Only); INIS.

From the Contributions to the 10th International Conference on Plasma Surface Interactions (Monterey, 30 March - 3 April, 1992), separate abstracts were prepared for 3 papers. The topics were: film deposition on metallic surfaces at liquid nitrogen temperature in view of the conditioning of the FT vacuum chamber; impurity screening in high-density limiter tokamaks; and the optimization of the Frascati Tokamak Upgrade limiter shape.

28047 (ENEA-RT-NUCL–92-12, pp. 5-15) **Film deposition on metallic surfaces at liquid nitrogen temperature in view of conditioning of FTU vacuum chamber.** Apicella, M.L.; Neri, A.; Verdini, L. ENEA, Frascati (Italy). May 1992. (CONF-920311–Exc.: 10. international conference on plasma-surface interactions in controlled fusion devices, Monterey, CA (United States), 30 Mar - 3 apr 1992; RT/NUCL–92-12). In *Contributions to 10th international conference on plasma surface interactions.* 42p. Order Number DE93799249. Source: OSTI; NTIS (US Sales Only); INIS.

The properties of carbon films on metallic surfaces at 77 degrees K, which is approximately the FTU (Frascati Tokamak Upgrade) wall temperature,were studied for the first time. Very good results, up to a maximum film thickness of 3 microns, were obtained. Evidence of blistering on the sample surface appeared only when the current density, during carbonization, exceeded considerably the value of 15 micro A/square centimeters.

28048 (ENEA-RT-NUCL–92-12, pp. 31-42) **Optimization of FTU toroidal limiter shape.** Ciotti, M.; Ferro, C.; Maddaluno, G. ENEA, Frascati (Italy). May 1992. (CONF-920311–Exc.: 10. international conference on plasma-surface interactions in controlled fusion devices, Monterey, CA (United States), 30 Mar - 3 apr 1992; RT/NUCL–92-12). In *Contributions to 10th international conference on plasma surface interactions.* 42p. Order Number DE93799249. Source: OSTI; NTIS (US Sales Only); INIS.

The FTU machine is now operating with an Inconel/stainless steel poloidal limiter. The necessity to withstand the large heat flux in the radio-frequency heating operational phase and to minimize plasma edge asymmetries has induced the feasibility of a toroidal limiter to be assessed. To take into account heat loads due to inevitable misalignements in the radial positioning of the limiter sectors, a 3-D analysis of the problem was carried out. Within this analysis, the shadowing between adjacent sectors was found to be the most critical factor because of the shortness of the energy decay length. In spite of the 3-D optimization of the limiter surface, peak heat load strongly increased with the safety factor at the edge and reaches up to a factor of four with respect to the average heat load.

28049 (ENEA-RT-NUCL–92-14, pp. 13-16) **Energy confinement of FTU ohmic plasma.** Alladio, F.; Berton, F.; Bracco, G.; Buratti, P.; Tudisco, O.; Bruschi, A.; De Luca, F.; Jacchia, A.; Mantica, P. ENEA, Frascati (Italy); Milan Univ. (Italy). Dipt. di Fisica. May 1992. (CONF-920610–Exc.: ICPP 92: International conference on plasma physics, Innsbruck (Austria), 29 Jun - 3 jul 1992; RT/NUCL–92-14). In *Contributions to 1992 international conference on plasma physics.* 40p. Order Number DE93799278. Source: OSTI; NTIS (US Sales Only); INIS.

The FTU (Frascati Tokamak Upgrade) has been operating in a wide range of plasma parameters. Typical performed plasma discharges are at: line averaged density = $2*10^{19}$:$1.5*10^{20}$ per cubic meter; magnetic field = 6 T; plasma current = 0.35:0.75 MA hydrogen and deuterium. The FTU plasma energy content is evaluated by making use of kinetic and magnetic measurements. Plasma geometry is obtained as the reconstruction of the plasma equilibrium

from magnetic diagnostics data. The electron temperature is measured by ECE analysis and the line averaged density profile is reconstructed with the use of equilibrium geometry and data from a 5 point DCN interferometer. Diamagnetic energy and equilibrium beta are also available. Effective ion charge is measured by an array of bremsstrahlung radiation detectors. Passive NPA provides information on the peak ion temperature whose profile is computed by solving the ion energy balance equation. A data base containing the confinement results for 500 plasma pulses has been prepared, and the most stationary conditions for each discharge have been chosen. The most striking feature of FTU plasma is the variety of line average density profiles, divided into flat and peaked profiles. This paper briefly comments on the most significant FTU results relative to confinement, heat pulse propagation and peaked density profiles.

28050 (ENEA-RT-NUCL–92-14, pp. 37-40) **Alfa-particle behaviour outside the last closed magnetic surface in divertor stellarators.** Alladio, F.; Batistoni, P.; Mancuso, A. ENEA, Frascati (Italy). May 1992. (CONF-920610–Exc.: ICPP 92: International conference on plasma physics, Innsbruck (Austria), 29 Jun - 3 jul 1992). In *Contributions to 1992 international conference on plasma physics.* 40p. Order Number DE93799278. Source: OSTI; NTIS (US Sales Only); INIS.

Usually, stellarators are characterized by high aspect ratios (A>10), however, the exploration of more compact aspect ratios is interesting due to the reduced winding size and the higher use of the magnetic field volume. However, the combination of toroidal effects with the helical ripples of the magnetic field raises concern about alpha particles confinement necessary for steady ignition. Recently, investigations have been made on the amount and the spatial distribution of direct collisionless losses of alpha particles in stellarators with varying aspect ratios. The studied configurations have been idealized stellarators with 1=2 poloidal winding number and with helicoidal surface currents distributed on circular tori, flowing with constant pitch in toroidal coordinates (that means a higher pitch in the outside and a lower pitch in the inside of the torus). Th e choice of this winding law has turned out to be a rewarding one since it has allowed a fully analytical treatment of the 3-D vacuum field and has permitted an easy access to low aspect ratios. The parameters of one of the most interesting configurations so far considered are: R*/a*=2.15 as the aspect ratio of the surface current distribution, A=4.35 as the plasma aspect ratio, M=9 as the toroidal winding number, t axis = 0.108 and t edge = 1.15, as the values of the rotational transform at the axis and at the edge respectively. The toroidal field has the usual ideal form, B_0R_0-R. All the configurations are characterized by very low ergodicity of the vacuum field, strong shear at the edge, and pronounced separatrix features.

28051 (ETDE-IT–93-186) **Behavior of SiC/Al coatings under high-dose irradiation with deuterium and helium ions.** Rubel, M.; Franconi, E.; Almqvist, N.; Emmoth, B.; Brossa, F. ENEA, Frascati (Italy). 1993. 20p. Order Number DE93799273. Source: OSTI; NTIS (US Sales Only); INIS.

Aluminium-silicon carbide coatings obtained by vacuum plasma spraying co-deposition are considered as a new class of plasma-facing materials (PFMs) for fusion devices. The technical requirements for PFMs are stringent since they have to withstand severe operation conditions, including bombardment by high fluxes of particles escaping the plasma. A number of Al/SiC coatings (containing 20 or 50% SiC) deposited on copper, stainless steel, or graphite substrates were irradiated under laboratory conditions with high doses of deuterium or helium ions. The surface properties of the materials were characterized before and after irradiation using several analytical techniques (RBS, NRA, SIMS, AES, EDS, microscopic methods, and laser profilometry). Exposures to low-energy deuterium ions or deuterium plasma resulted in the implantation of 7 - $9x10^{16}$ D cm^{-2} in the near-surface layer. The initial steps of blister formation were also observed. Changes in the surface structure were noted following irradiation with $4He^+$ ions (1.5 - 2 MeV). Damage in the surface layer of the materials was dependent on the ion flux.

28052 (EUR-CEA-FC–1481) **Computation of simulation of defects in carbon-metal composite soldering joints and comparison with experimental results by infra red imaging.** Lipa, M.; Deschamps, P.; Dufayet, A.; Chappuis, P.; Schlosser, J. Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee. Feb 1993. [116p.] (In French). Source: OSTI; NTIS (US Sales Only); INIS.

Soldering defects of some components of TORE SUPRA are simulated by calculation and results are compared to nondestructive testing by infrared thermography of heated components. They are heated by two methods (1) By sending cold or hot water front in the cooling structure and simultaneous measurement of temperature evolution of tile surface versus time and (2) By deposition of a thermal flux on tiles with an electron gun and measurement of the surface temperature of the tile in steady state when heat is evacuated by the cooling water circuit. 42 figs.

28053 (GA-A–21281) **Results from the DIII-D advanced divertor program.** Schaffer, M.J. (General Atomics, San Diego, CA (United States)); Brooks, N.H.; Evans, T.E.; Groebner, R.J.; Hinton, F.L.; Hollerbach, M.A.; Hyatt, A.W.; Jackson, G.L.; Leonard, A.W.; Lippmann, S.I.; Mahdavi, M.A.; Osborne, T.H.; Petrie, T.W.; Sevier, D.L.;General Atomics, San Diego, CA (United States). Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ;W-7405-ENG-48 ;AC05-84OR21400 ;FG03-89ER51121 ;AC04-76DP00789 ;AC03-89ER53277. (CONF-9305210–1: 9. International Atomic Energy Agency (IAEA) workshop on stellarators, Garching (Germany), 10-14 May 1993). Order Number DE93015472. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents a summary of some recent DIII-D boundary and divertor experiments. The single-null poloidally diverted plasmas were studied in the standard DIII-D open divertor configuration and in interaction with the toroidally symmetric divertor biasing electrode and exhaust pump. Results are reported for: scrape-off layer (SOL) density and its effect on impurity influx; SOL density and divertor bias; divertor pumping; divertor bias and exhaust gas collection; divertor bias and H-mode threshold.

28054 (GA-A–21311) **Variation of divertor plasma parameters with divertor depth for H-mode discharges in DIII-D.** Hill, D.N. (Lawrence Livermore National Lab., CA (United States)); Allen, S.L.; Jong, R.A.; Lasnier, C.; Porter, G.D.; Wood, R.; Petrie, T.W.; Brooks, N.H.; Evans, T.E.; Leonard, A.W.; Lippmann, S.I.; Mahdavi, M.A.; West, W.P.; Buchenauer, D.; Cuthbertson,General Atomics, San Diego, CA (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ;W-7405-ENG-48 ;AC04-76DP00789 ;FG03-89ER51121. (CONF-930720–8: 20. European conference on controlled fusion and plasma physics, Lisbon (Portugal), 26-30 Jul 1993). Order Number DE93015475. Source: OSTI; NTIS; INIS; GPO Dep.

We report here the results of experiments aimed at quantifying the advantages of increasing the X-point to target-plate distance in a diverter tokamak operating with H-mode confinement. Larger distances should lower the peak electron temperature at the target plates, thereby reducing sputtering and lowering the impurity concentration in the care plasma. When gas puffing is used to reduce the diverter heat flux, extra field-line length may increase the volume available for radiation and increase gas isolation between the core and diverter regions.

28055 (LA-UR–93-2354) **A microsecond-pulsewidth, intense, light-ion beam accelerator.** Rej, D.J.; Bartsch, R.R.; Davis, H.A.; Greenly, J.B.; Waganaar, W.J. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930616–5: 9. IEEE pulsed power conference, Albuquerque, NM (United States), 21-23 Jun 1993). Order Number DE93016455. Source: OSTI; NTIS; INIS; GPO Dep.

A relatively long-pulsewidth (0.1-1 μs) intense ion beam accelerator has been built for materials processing applications. An applied-B_r, magnetically-insulated extraction ion diode with dielectric flashover ion source is installed directly onto the output of a 1.2-MV, 300-kJ Marx generator. Initial operation of the accelerator at 0.4 MV indicates satisfactory performance without the need for additional pulse-shaping.

28056 Apparatus for conversion of whispering-gallery modes into a free space Gaussian like beam. Stallard, B.W.; Makowski, M.A.; Byers, J.A. To Dept. of Energy. 1991. USA patent application 7-711,693. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93015707. Source: OSTI; NTIS; INIS; GPO Dep.

An optical converter for efficient conversion of millimeter wavelength whispering-gallery gyrotron output into a linearly polarized, free-space Gaussian-like beam. The converter uses a mode-converting taper and three mirror optics. The first mirror has an azimuthal tilt to eliminate the k_ϕ component of the propagation vector of the gyrotron output beam. The second mirror has a twist reflector to linearly polarize the beam. The third mirror has a constant phase surface so the converter output is in phase.

28057 (PPPL-CFP–2819) **Power and particle control in the Tokamak Physics Experiment divertor.** Ulrickson, M.A. (Princeton Univ., NJ (United States)); Stotler, D.P.; Hill, D.N.; Rognlien, T.D.; Brooks, J.N.; Juliano, D.R.; Ruzic, D.N.; Werley, K.A. Princeton Univ., NJ (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (CONF-930720–4: 20. European conference on controlled fusion and plasma physics, Lisbon (Portugal), 26-30 Jul 1993). Order Number DE93014644. Source: OSTI; NTIS; INIS; GPO Dep.

The reference design for the Tokamak Physics Experiment (TPX) includes a double null divertor magnetic configuration. The main motivations for choosing the double null (DN) are the desire to operate with high triangularity (δ), DIII-D experimental results suggesting that high δ is favorable for advanced performance, theoretical indications that high δ is needed for access to the highest β regimes. The DN geometry also provides the flexibility to study the range of ℓ_i required for advanced tokamaks. TPX is being designed to have high plasma heating power (18–45 MW) and long pulse lengths (1000 s to steady state). The divertor configuration is capable of handling SN operation and a wide range of different plasma conditions (e.g., ℓ_i up to 1.6 and β_N up to 7). We will discuss the pumping speed required to maintain density control and the methods we have used to predict the particle throughput. Possibilities for improving divertor performance, such as a radiative divertor, are also discussed. The distance from the x-point to the divertor plate has been kept as long as practical (0.57 m in the poloidal plane and 16.3 m along a field line) in order to allow room for a radiative divertor.

28058 (PPPL-CFP–2821) **The mission and physics design of TPX.** Goldston, R.J. (Princeton Univ., NJ (United States). Plasma Physics Lab.); Jardin, S.; Kessel, C.; Liew, S.L.; Manickam, J.; Mikkelsen, D.; Pomphrey, N.; Reiersen, W.T.; Reiman, A.; Rewoldt, G.; Schmidt, J.A.; Sinnis, J.C.; Stotler, D.P.; Tang, W.; UlricksPrinceton Univ., NJ (United States). Plasma Physics Lab. [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (CONF-930720–3: 20. European conference on controlled fusion and plasma physics, Lisbon (Portugal), 26-30 Jul 1993). Order Number DE93014645. Source: OSTI; NTIS; INIS; GPO Dep.

The mission of the Tokamak Physics Experiment (TPX) is to develop the scientific basis for an economic, compact, and steady-state tokamak fusion reactor. This will require the development and demonstration of stable, steady-state tokamak operating regimes, with high β, high confinement, and high bootstrap fraction.

28059 (RTI-NUCL-FUS-BRA-ISP–90) **Reactivity and corrosion properties of metallic lithium candidate blanket breeder for fusion reactors.** Agostini, P.; Benamati, G. ENEA, Camugnano (Italy). Centro Ricerche Energia Brasimone - Area Nucleare. 1991. 44p. Order Number DE93799301. Source: OSTI; NTIS (US Sales Only); INIS.

This paper collects the most interesting data, from a technological point of view, relative to the reactivity of lithium and the behaviour of steels in presence of it. For this aim, extensive information is reported about the reactivity of lithium with different atmospheres. The influence of nitrogen content in lithium corrosion is pointed out.

28060 (SAND–93-1289C) **Physics of gas breakdown for ion beam transport in gas.** Olson, C.L. (Sandia National Labs., Albuquerque, NM (United States)); Poukey, J.W.; Hinshelwood, D.D.; Rose, D.V.; Hubbard, R.F.; Lampe, M.; Neri, J.M.; Ottinger, P.F.; Slinker, S.P.; Stephanakis, S.J.; Young, F.C.; Welch, D.R. Sandia National Labs., Albuquerque, NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9305136–2: International symposium on heavy ion fusion, Frascati (Italy), 25-28 May 1993). Order Number DE93015646. Source: OSTI; NTIS; INIS; GPO Dep.

Detailed analysis, experiments, and computer simulations are producing a new understanding of gas breakdown during intense ion beam transport in neutral gas. Charge neutralization of beam micro clumps is shown to limit the net clump potentials to a non-zero value π_{min}, which can lead to divergence growth and axial energy spreading. At pressures $\gtrsim$ 1 Torr, plasma shielding should substantially reduce this effect Current neutralization has been studied in experiments on the GAMBLE II accelerator. The importance of fast electrons (knockons and runaways) has been established in IPROP simulations, which are in agreement with the experiments. For light ion fusion parameters with pressures $\gtrsim$ 1 Torr, very small net current fractions ($\ll$ 1%) appear feasible, permitting ballistic transport in gas. Self-pinched requires higher net current fractions ($\geq$ 2%) and preliminary IPROP code results indicate that this appears achievable for small-radius intense beams in lower pressure gases ($\gtrsim$Torr). Several self-pinched transport concepts look promising. The importance of these results for both light ion fusion and heavy ion fusion is discussed.

28061 (UCRL-ID–111954) **ITER-hard Toroidal Field coil structural analysis.** Wineman, S.J. Lawrence Livermore National Lab., CA (United States). 15 Oct 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014834. Source: OSTI; NTIS; INIS; GPO Dep.

The High Aspect Ratio Design (HARD) for the International Thermonuclear Experimental Reactor (ITER) has Toroidal Field (TF) coils that are farther out from the center of the Toroidal ring and more elongated than the previous design (CDA). These coils should see higher forces than in CDA and were designed accordingly. The objective of this work, conducted at LLNL and the MIT Plasma Fusion Center, was to determine whether stress levels in the ITER-HARD design are acceptable. A global finite element model, representing one of the coils, was modeled at MIT to obtain stresses and displacements both during operation of the TF coils alone, and during the End of Burn phase with TF and PF (Poloidal Field) coils operating. At LLNL, a detail model of the TF coil straight leg near the equator was used to obtain stresses and displacements during TF operation only. Further detailed analysis of the winding pack of this model was done to estimate stress concentrations in the conduit and insulation.

28062 (UCRL-ID–112569) **Method to prevent ejecta from damaging the Compact Torus Accelerator driver of an inertial fusion energy power plant.** Mattingly, S.E.K.; Moir, R.W. Lawrence Livermore National Lab., CA (United States). 16 Dec 1992. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013104. Source: OSTI; NTIS; INIS; GPO Dep.

Concern has been expressed about the conceptual design of fusion reactors using a Compact Torus Accelerator (CTA). A CTA accelerates a plasma torus toward a fusion target. When the torus nears the target, it is compressed and focused down to a small volume, creating a very high energy density and initiating a fusion micro explosion. The focusing cone is destroyed with each shot due to the stress from the passage of the torus as well as from the force of the explosion (1 800 MJ of yield, ~0.5 Ton TNT equivalent). The focusing cone could be made of solidified Li_2BeF_4; the same material used in liquid state to protect the reaction chamber from the micro explosion and to transport heat away to a power plant. The problem with this design is that when the focusing cone is shattered, the resulting small pieces of solid and liquid debris (ejecta) might be carded along by the expanding vapor of the explosion and might enter the CTA itself, causing damage and shortening the life of the CTA. The proposed solution for this possible problem is to bend the focusing cone so that the ejecta no

longer have a clear path to the CTA. Calculations show that the plasma torus may be sent through a radius of curvature of less than 0.5 m just after the focusing cone, without significantly disturbing the plasma.

28063 (UCRL-JC–108854) **The ETA-II linear induction accelerator and IMP wiggler: A high-average-power millimeter-wave free-electron-laser for plasma heating.** Allen, S.L.; Scharlemann, E.T. Lawrence Livermore National Lab., CA (United States). May 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930594–1: 9. international conference on high power particle beams, Washington, DC (United States), 25-29 May 1993). Order Number DE93013832. Source: OSTI; NTIS; INIS; GPO Dep.

We have constructed a 140-GHz free-electron laser to generate high-average-power microwaves for heating the MTX tokamak plasma. A 5.5-m steady-state wiggler (intense Microwave Prototype-IMP) has been installed at the end of the upgraded 60-cell ETA-II accelerator, and is configured as an FEL amplifier for the output of a 140-GHz long-pulse gyrotron. Improvements in the ETA-II accelerator include a multicable-feed power distribution network, better magnetic alignment using a stretched-wire alignment technique (SWAT). and a computerized tuning algorithm that directly minimizes the transverse sweep (corkscrew motion) of the electron beam. The upgrades were first tested on the 20-cell, 3-MeV front end of ETA-II and resulted in greatly improved energy flatness and reduced corkscrew motion. The upgrades were then incorporated into the full 60-cell configuration of ETA-II, along with modifications to allow operation in 50-pulse bursts at pulse repetition frequencies up to 5 kHz. The pulse power modifications were developed and tested on the High Average Power Test Stand (HAPTS), and have significantly reduced the voltage and timing jitter of the MAG 1D magnetic pulse compressors. The 2-3 kA. 6-7 MeV beam from ETA-II is transported to the IMP wiggler, which has been reconfigured as a laced wiggler, with both permanent magnets and electromagnets, for high magnetic field operation. Tapering of the wiggler magnetic field is completely computer controlled and can be optimized based on the output power. The microwaves from the FEL are transmitted to the MTX tokamak by a windowless quasi-optical microwave transmission system. Experiments at MTX are focused on studies of electron-cyclotron-resonance heating (ECRH) of the plasma. We summarize here the accelerator and pulse power modifications, and describe the status of ETA-II, IMP, and MTX operations.

28064 (UCRL-JC–110213) **Evolution of high-repetition-rate induction accelerators through advancements in switching.** Kirbie, H.C.; Caporaso, G.J.; Newton, M.A.; Yu, S.S. Lawrence Livermore National Lab., CA (United States). 20 Aug 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9208109–88: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93012599. Source: OSTI; NTIS; GPO Dep.

Future applications of linear and recirculating induction accelerators include microwave sources for plasma heating and linear colliders, industrial manufacturing processes, and heavyion fusion. These applications require pulsed sources capable of sustained operation at high pulse-repetition rates. Powering these new accelerators places severe switching demands on the source that often can not be met with commercially-available technology. Consequently, several new accelerator switching schemes have been developed at Lawrence Livermore National Laboratory (LLNL). Our transition from spark-gap technology to magnetic switching has merged the formerly independent roles of source and cell into a single system and reshaped our design methods to emphasize high efficiency. Treatment of the accelerator as a system has also enabled us to optimize new accelerator designs based on cost considerations. Presently, we are developing a technology for driving a heavy-ion induction recirculator at pulse rates exceeding 100 kHz. In this case, the switching method is all solid state and the source and cell have evolved into a unified device.

28065 (UCRL-JC–111690) **Predicted performance of a dc beam driven FEM oscillator designed for fusion applications at 200-250 GHz.** Caplan, M. (Lawrence Livermore National Lab., CA (United States)); Best, R.W.B.; Verhoeven, A.G.A.; van der Wiel, M.J.; Urbanus, W.H.; Bratman, V.L.; Denisov, G.G. Lawrence Livermore National Lab., CA (United States). 21 Aug 1992. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9208142–22: 14. international free electron laser conference, Kobe (Japan), 23-28 Aug 1992). Order Number DE93013414. Source: OSTI; NTIS; GPO Dep.

A Free Electron Laser using a DC beam with depressed collector is being developed at the FOM Institute (Netherlands) for plasma heating which will be capable of producing 1 MW CW output over an adjustable tuning range of 200-250 GHz. The basic design parameters for the electron beam, undulator and waveguide circuit are determined using a 3D non-wiggle averaged waveguide mode particle interaction code including AC space charge effects. Novel features of the design include using a step tapered two section wiggler to achieve both the high gain (10) and the required efficiency (~5%) as well as a rectangular corrugated HE_{11} waveguide circuit to handle the high average power requirements. Results are presented on FEM performance including dependence on beam emittance, percent feedback, and operating frequency.

28066 (UCRL-JC–112341) **Longitudinal beam dynamics for heavy ion fusion.** Callahan, D.A. (Lawrence Livermore National Lab., CA (United States)); Langdon, A.B.; Friedman, A.; Haber, I. Lawrence Livermore National Lab., CA (United States). 13 May 1993. 3p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;AI05-83ER40112 ;AI05-92ER54177. (CONF-930511–69: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93013850. Source: OSTI; NTIS; INIS; GPO Dep.

The longitudinal wall impedance instability is of great interest for a heavy ion fusion (HIF) driver because complete stabilization of this mode via momentum spread is impractical due to requirements of focusing the beam onto the inertial confinement fusion target. This instability is being studied with the WARPrz particle-in-cell code. The impedance of the induction linac modules is modeled as a wall impedance corresponding to a continuum of resistors and capacitors in parallel. We discuss simulations of the this instability, including reflections of perturbations off the beam end and the effects of finite temperature, and simulations of errors in intermittently-applied axial confining fields as a seed for this instability. We also present very long simulations in which we look for beam equilibria.

28067 (UCRL-JC–112361) **Impedance-power effects on plasma polymer surface finish using a helical resonator discharge.** Brusasco, R.; Ferguson, S.W.; Stever, R. Lawrence Livermore National Lab., CA (United States). 9 Dec 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930304–30: 205. American Chemical Society national meeting, Denver, CO (United States), 28 Mar - 2 apr 1993). Order Number DE93016454. Source: OSTI; NTIS; INIS; GPO Dep.

Plasma polymerized organic coatings are used in the fabrication of targets for experiments in the Inertial Confinement Fusion (ICF) program at Lawrence Livermore National Laboratory. The authors are performing experiments to understand the process conditions leading to the preparation of smooth (≈100Å) plasma polymer surfaces while maintaining the highest deposition rate possible. It had been reported by Howling et al., that the formation of particulate matter in the deposition of silicon by the plasma reaction of silane affected the plasma impedance. This suggested that experiments designed to examine the correlation of surface texture with plasma impedance would be of interest. Furthermore, it is possible that an impedance change may cause a change in the power coupling efficiency from the transmitter to the plasma. Preliminary work in the authors laboratory indicated that the reactor temperature influenced the surface texture. The focus of this paper is to carefully examine the effects of reactor temperature on the surface texture of the plasma polymer, ensuring constant reactor conditions especially with respect to rf power.

28068 (UCRL-JC–112378) **System modeling for the longitudinal beam dynamics control problem in heavy ion induction accelerators.** Payne, A.N. Lawrence Livermore National Lab., CA

(United States). 17 May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930511–213: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93016515. Source: OSTI; NTIS; INIS; GPO Dep.

We address the problem of developing system models that are suitable for studying the control of the longitudinal beam dynamics in induction accelerators for heavy ions. In particular, we present the preliminary results of our efforts to devise a general framework for building detailed, integrated models of accelerator systems consisting of pulsed power modular circuits, induction cells, beam dynamics, and control system elements. Such a framework will permit us to analyze and design the pulsed power modulators and the control systems required to effect precise control over the longitudinal beam dynamics.

28069 (UCRL-JC–113282) **Technology development for recirculating heavy-ion accelerators.** Newton, M.A.; Kirbie, H.C. Lawrence Livermore National Lab., CA (United States). 18 May 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9305136–4: International symposium on heavy ion fusion, Frascati (Italy), 25-28 May 1993). Order Number DE93016545. Source: OSTI; NTIS; INIS; GPO Dep.

The "recirculator," a recirculating heavy-ion accelerator has been identified as a promising approach for an inertial fusion driver. System studies have been conducted to evaluate the recirculator on the basis of feasibility and cost. The recirculator has been shown to have significant cost advantages over other potential driver schemes, but some of the performance requirements exceed the capabilities of present technology. The system studies identified the high leverage areas where advances in technology will significantly impact the cost and performance of a recirculator. One of the high leverage areas is the modulator system which generates the acceleration potentials in the induction cells. The modulator system must be capable of generating the acceleration potentials at peak repetition rates in excess of 100 kHz with variable pulse widths. LLNL is developing a modulator technology capable of driving induction cells using the latest in solid state MOSFET technology. A small scale modulator has been built and tested to prove the concept and the next version is presently being designed. The objective is to demonstrate a modulator operating at 5 kV, 1 kA, with 0.2–1 μs pulse widths while driving an induction cell at >100 kHz within the next year. This paper describes the recirculator, the technology requirements necessary to implement it and the modulator system development that is being pursued to meet these requirements.

28070 (UCRL-JC–114505) **Three dimensional hydrodynamic calculations with adaptive mesh refinement of the evolution of Rayleigh Taylor and Richtmyer Meshkov instabilities in converging geometry: Multi-mode perturbations.** Klein, R.I. (Lawrence Livermore National Lab., CA (US)); Bell, J.; Pember, R.; Kelleher, T. Lawrence Livermore National Lab., CA (United States). Apr 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9303126–4: 4. international workshop on the physics of compressible turbulent mixing, Cambridge (United Kingdom), 29 Mar - 1 apr 1993). Order Number DE93017155. Source: OSTI; NTIS; GPO Dep.

The authors present results for high resolution hydrodynamic calculations of the growth and development of instabilities in shock driven imploding spherical geometries in both 2D and 3D. They solve the Eulerian equations of hydrodynamics with a high order Godunov approach using local adaptive mesh refinement to study the temporal and spatial development of the turbulent mixing layer resulting from both Richtmyer Meshkov and Rayleigh Taylor instabilities. The use of a high resolution Eulerian discretization with adaptive mesh refinement permits them to study the detailed three-dimensional growth of multi-mode perturbations far into the non-linear regime for converging geometries. They discuss convergence properties of the simulations by calculating global properties of the flow. They discuss the time evolution of the turbulent mixing layer and compare its development to a simple theory for a turbulent mix model in spherical geometry based on Plesset's equation. Their 3D calculations show that the constant found in the planar incompressible experiments of Read and Young's may not be universal for converging compressible flow. They show the 3D time trace of transitional onset to a mixing state using the temporal evolution of volume rendered imaging. Their preliminary results suggest that the turbulent mixing layer loses memory of its initial perturbations for classical Richtmyer Meshkov and Rayleigh Taylor instabilities in spherically imploding shells. They discuss the time evolution of mixed volume fraction and the role of vorticity in converging 3D flows in enhancing the growth of a turbulent mixing layer.

99 GENERAL AND MISCELLANEOUS

28071 (DOE/ER/75636–1) **Exhibit-based energy teaching at the Exploratorium: Final report, September 1, 1991–August 31, 1992.** Exploratorium, San Francisco, CA (United States). 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER75636. Order Number DE93016288. Source: OSTI; NTIS; GPO Dep.

Exhibits were developed which explored transfer of energy (water pumping, photosynthesis). Publications were also developed on the first and second laws of thermodynamics, and on air pollution.

28072 (DOE/ER/75842–1) **[Workshop for coordinating South Carolina's pre-college systemic initiatives in science and mathematics].** South Carolina Univ., Columbia, SC (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-92ER75842. (CONF-9208223–Summ.: Mathematics and sciences education summit, Fripp Island, SC (United States), 28-30 Aug 1992). Order Number DE93012263. Source: OSTI; NTIS; GPO Dep.

On December 19, 1991, South Carolina's Governor, established the Governor's Mathematics and Sciences Advisory Board (MSAB) to articulate a vision and develop a statewide plan for improving science and mathematics education in South Carolina. The MSAB recognized that systemic change must occur if the achievement levels of students in South Carolina are to improve in a dramatic way. The MSAB holds two fundamental beliefs about systemic change: (1) All the elements of the science and mathematics education system must be working in harmony towards the same vision; and (2) Each element of the system must be held against high standards and progress must be assessed regularly against these standards.

28073 (DOE/RL/12523–1) **Math and Science School (MASS): A Department of Energy enhancement program to benefit students from Native American Tribes affected by the Hanford Reservation: Progress report.** Jaeger, M. Eastern Oregon State Coll., La Grande, OR (United States). 20 Mar 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-92RL12523. Order Number DE93015061. Source: OSTI; NTIS; GPO Dep.

Math and Science School is a program designed to enrich and encourage elementary students and teachers of the Confederated Tribes of the Umatilla Indian Reservation in the areas of mathematics and science activities. By providing access to special hands-on workshop sessions held in the mobile science laboratory at the school sites during the school year for students and teachers and with a separate summer inservice program for students, elementary children and teachers are encouraged to explore the fascination of science and the utility of mathematics through use of integrated curricula. The Department of Energy grant underwrites the instructional costs of this system while the grantee provides the mobile laboratory and the majority of the materials.

28074 (DOE/AD–0046) **DOE real property: A yearly statistical handbook, Fiscal year 1992.** USDOE Office of the Associate Deputy Secretary for Field Management, Washington, DC (United States). 1992. 104p. Sponsored by USDOE, Washington, DC

(United States). Order Number DE93015997. Source: OSTI; NTIS; GPO Dep.

To assist in the tracking, reporting, and management of the real property, DOE has an automated inventory information system. This handbook was prepared as a resource for DOE officials and others who have a need to reference real property data as part of their day-to-day functions. It is intended as an internal working document, and the information therein is a compilation or analysis of data in the information system. It is divided into: land, buildings, and other structures and facilities.

28075 (DOE/ER/75730–1) **Evaluation and capacity building to improve precollege science and mathematics achievement in the US: 10 CFR, Part 605: Technical progress report, June–December 1992.** Network, Inc., Andover, MA (United States); National Center for Improving Science Education, Andover, MA (United States). [1992]. 277p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER75730. Order Number DE93016309. Source: OSTI; NTIS; GPO Dep.

The National Center for Improving Science Education has undertaken activities to achieve evaluation goals for DOE's Precollege programs: develop means to determine program quality; develop means for determining the contribution of DOE precollege programs to both teacher enhancement and student achievement; provide evaluation designs and instruments and reports of program quality and impact; and strengthen both DOE's and the Labs' capacity to do both short- and long-term planning as well as deliver effective programs and evaluation. Appendices include evaluation/technical assistance report, profiling teacher research participation and teacher development programs, teacher surveys, impact assessment design, and teacher research participation programs anecdotes for 8 labs.

28076 (DOE/IG–0328) **Audit of Mound Plant's reduction in force.** USDOE Office of Inspector General, Oak Ridge, TN (United States). Eastern Regional Audit Office. 17 May 1993. 32p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

Report to The Secretary.

Objective of this audit was to determine whether the Mound Plant's Fiscal Year 1992 reduction in force (RIF) was effectively managed and implemented properly by DOE. DOE established policy to encourage contractors to reduce staffing by voluntary separations without unreasonable separation costs. EG&G Mound's FY 1992 RIF was accomplished by voluntary separations; however, its implementation unreasonably increased costs because DOE did not have adequate criteria or guidelines for evaluating contractors' RIF proposals, and because EG&G Mound furnished inaccurate cost data to DOE evaluators. The unreasonable costs amounted to at least $21 million. Recommendations are made that DOE develop and implement guidelines to impose limitations on voluntary separation allowances, early retirement incentive payments, and inclusion of crucial employee classifications in voluntary RIFs.

28077 (DOE/IG–0329) **Inspection of management of excess personal property at Rocky Flats.** USDOE Office of Inspector General, Washington, DC (United States). Office of Inspections. 17 May 1993. 34p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

Report to The Secretary.

Inspection revealed that immediate management attention is needed to properly control, store, and dispose of excess personal property at Rocky Flats. Current system of operation does not allow for efficient, timely, cost effective management; current storage and disposal practices are not consistent with contract requirements or DOE policies and procedures. Other deficiencies are pointed out. Results of inspection are divided into 4 sections: contract changeover issues, moratorium issues, additional excess property issues, and award fee observations. Recommendations are outlined.

28078 (DOE/PR–0048) **Department of Energy listing of awardee names active awards.** USDOE Office of Procurement, Assistance and Program Management, Washington, DC (United States). 6 Apr 1993. 519p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93016903. Source: OSTI; NTIS; GPO Dep.

This DOE procurement and assistance data system (PADS) for active awards, lists awardee name/division, bin, completion date, description of work, vendor ID, city, state, congressional district, contract value, obligations to data, and P/S.

28079 (EDF-DER-RA–1992-1) **D.E.R. 92 - Main facts.** Electricite de France (EDF), 92 - Clamart (France). 1992. [143p.] (In French). Order Number DE93631737. Source: OSTI; NTIS (US Sales Only); INIS.

This report presents the main facts of the studies carried out by the Direction des Etudes et Recherches (DER) of Electricite de France: new applications of electricity, classical and nuclear thermal power plants, electrical equipment, environment protection, network analysis, information and informatic equipment.

28080 (EGG-M–93143) **Creating a strategic plan for configuration management using computer aided software engineering (CASE) tools.** Smith, P.R.; Sarfaty, R. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9304134–1: 1993 National Department of Energy (DOE)/contractors and facilities data acquisition and control user's group meeting, Livermore, CA (United States), 13-16 Apr 1993). Order Number DE93013663. Source: OSTI; NTIS; INIS; GPO Dep.

This paper provides guidance in the definition, documentation, measurement, enhancement of processes, and validation of a strategic plan for configuration management (CM). The approach and methodology used in establishing a strategic plan is the same for any enterprise, including the Department of Energy (DOE), commercial nuclear plants, the Department of Defense (DOD), or large industrial complexes. The principles and techniques presented are used world wide by some of the largest corporations. The authors used industry knowledge and the areas of their current employment to illustrate and provide examples. Developing a strategic configuration and information management plan for DOE Idaho Field Office (DOE-ID) facilities is discussed in this paper. A good knowledge of CM principles is the key to successful strategic planning. This paper will describe and define CM elements, and discuss how CM integrates the facility's physical configuration, design basis, and documentation. The strategic plan does not need the support of a computer aided software engineering (CASE) tool. However, the use of the CASE tool provides a methodology for consistency in approach, graphics, and database capability combined to form an encyclopedia and a method of presentation that is easily understood and aids the process of reengineering. CASE tools have much more capability than those stated above. Some examples are supporting a joint application development group (JAD) to prepare a software functional specification document and, if necessary, provide the capability to automatically generate software application code. This paper briefly discusses characteristics and capabilities of two CASE tools that use different methodologies to generate similar deliverables.

28081 (IC–93/88) **Situating the history of technology in a philosophical triptych: Contours for future research.** Raina, D. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [28p.] Order Number DE93628573. Source: OSTI; NTIS (US Sales Only); INIS.

This is a review of recent developments in the field of the history of technology, infused as it is by the extension of the sociology of science to the sociology of technology. However, this review is directed at the rather ambitious task of outlining the methodological precepts for studying the advent of the discourse of modern and appropriate technologies in India. Hence it is a review that seeks to delineate an approach that would circumvent some of the traditional difficulties with the history of technology, that will be discussed ahead. (author). 23 refs.

28082 (INIS-GB–483) **Rutherford Appleton Laboratory.** Rutherford Appleton Lab., Chilton (United Kingdom). [1993]. [24p.] Order Number DE93631738. Source: OSTI; NTIS (US Sales Only); INIS.

Rutherford Appleton Laboratory (RAL), described in this document, supports a wide variety of projects. Each year more than 1000 scientists and engineers visit RAL to use its world-class laser and neutron-scattering facilities. RAL staff design and build instruments which circle the Earth in satellites, increasing our understanding of ozone depletion and global warming, of the life cycles of stars and galaxies and, indeed, of the origin of the Universe itself. They work with their academic colleagues at international laboratories such as European Organization for Nuclear Research (CERN), Geneva, where massive underground machines probe the microstructure of the atomic nucleus. Vastly complex calculations are carried out on the design of anti-cancer drugs, for example, using supercomputers at RAL. (author).

28083 (INIS-JP–013) **Technical publications by JAERI staff in 1992, vol. 26.** Japan Atomic Energy Research Inst., Tokyo (Japan). May 1993. 121p. Order Number DE93508345. Source: OSTI; NTIS; INIS.

This list contains 969 references published as technical reports by JAERI and selected from JAERI personnel's papers in journals and other publications in 1992. A bibliographic description for each entry consists of title, carrier language, author(s) and source. The references fall into three groups. While JAERI report and JAERI-M report groups are sorted by report number, Papers-in-Journals group is arranged by the first author. The indexes are both by personal author and corporate entry. (author) 969 refs.

28084 (RAL–92-050-V1) **ISIS annual report for the financial year 1 April 1991 to 31 March 1992. V. 1.** Wilson, C. Rutherford Appleton Lab., Chilton (United Kingdom). Jul 1992. [154p.] Order Number DE93631739. Source: OSTI; NTIS (US Sales Only); INIS.

Volume 1 of the 1992 Annual Report of ISIS, the neutron scattering facility based at the Rutherford Appleton Laboratory contains details of the work of the Facility over the past year. In addition to reports on the status of the accelerator and instruments, instrument developments, support facilities, publications etc, Volume 1 contains summaries of the science performed, often with reference to reports contained in the current volume. In addition, there are more extended articles highlighting a range of recently performed experiments. (author).

28085 (RAL–92-050-V2) **ISIS annual report for the financial year 1 April 1991 to 31 March 1992. V. 2.** Wilson, C. Rutherford Appleton Lab., Chilton (United Kingdom). Jul 1992. [394p.] Order Number DE93631740. Source: OSTI; NTIS (US Sales Only); INIS.

This, Volume 11 of the 1992 Annual Report of ISIS the neutron scattering facility at Rutherford Appleton Laboratory contains the Experimental Reports on those experiments carried out on ISIS in the year ending 31 March 1992. Included are Experimental Reports from work performed on 14 ISIS instruments (13 neutron and one muon beam), and the number and quality of these reports reflects very well upon the standard of experiments performed at the Facility. The continuing increase in productivity of ISIS, which has extended through the initial development stage of the source, demonstrates that much new science continues to be done at ISIS, and that with the development and provision of new instruments, the scientific output of the Facility will continue to show strong growth. These Experimental Reports are intended as interim summaries of the measurements made during an ISIS experiment and as such may not contain the final conclusions of the analysis. They do, however, give a general flavour of the range and type of science performed on each instrument. (author).

28086 (Riso-R–680(EN)) **Environmental Science and Technology Department annual report 1992.** Jensen, A.; Gissel Nielsen, G.; Gundersen, V.; Nielsen, O.J.; Oestergaard, H.; Aarkrog, A. (eds.). Risoe National Lab., Roskilde (Denmark). Mar 1993. [91p.] Order Number DE93631741. Source: OSTI; NTIS; INIS.

Through basic and strategic research, the Environmental Science and Technology Department aspires to develop new ideas for industrial and agricultural production thus exerting less stress and strain on the environment. The department endeavours to develop a competent scientific basis for future production technology and management methods in industrial and agricultural production. The research approach in the department in predominantly experimental. Selected department research activities during 1992 are introduced and reviewed in seven chapters: 1. Introduction. 2. The Atmospheric Environment. 3. Plant Genetics and Resistance Biology. 4. Plant Nutrition and Mineral Cycling. 5. Chemistry of the Geosphere. 6. Ecology and Mineral Cycling. 7. Other Activities. The department's contribution to national and international collaborative research programmes in presented in addition in formation about large research and development facilities used and management by the department. The department's educational and training activities are included in the annual report along with lists of publications, publications in press, lectures and poster presentations at international meetings. The names of the scientific and technological staff members, visiting scientists, Post. doctoral fellows, Ph.D. students and M.Sc. students are also listed. (au).

28087 (SAND–93-0480C) **Creating and maintaining a visionary quality program.** Shirley, K.W.; Spencer, A.C. Sandia National Labs., Albuquerque, NM (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9309168–1: 2. international symposium on productive and quality improvement with a focus on government, Washington, DC (United States), 8-10 Sep 1993). Order Number DE93015122. Source: OSTI; NTIS; GPO Dep.

Developing a business plan that focuses on quality is not enough. Use quality principles to affect change and improve your organization's performance. Current management practices at Sandia National Laboratory are presented.

28088 (SR/H–524) **[Hanford] Service Department: Plant.** [Plant histories]. Hanford Engineer Works, Richland, WA (United States). [1946]. 174p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. Order Number DE93012364. Source: OSTI; NTIS (US Sales Only); GPO Dep.

As its name implies, the Service Department of TNX Operations at Hanford has been responsible for the several and diversified service-type functions common to plants operated by the du Pont Company. These normal duties include employment, industrial relations and training, selective service, safety and fire protection, laundry operation, and janitor services. At Hanford, this department also has operated the two Central Files (300 and 700 Areas), which has involved special classified document control. This document reviews Service Department (Plant) functions and organization from the early arrival of the Superintendent, in May 1943 to July 1, 1945.

28089 (SSI–92-11) **The history of radioactive wastes.** Persson, Lars. Swedish Radiation Protection Inst., Stockholm (Sweden). Jun 1992. [16p.] (In Swedish). Order Number DE93631742. Source: OSTI; NTIS; INIS.

The report gives a short history of the swedish views and politics concerning the management and disposal of radioactive wastes. A period of 40 years is reviewed.

28090 (SSI–92-14) **Research programs 1992/93 radiation protection.** Swedish Radiation Protection Inst., Stockholm (Sweden). Aug 1992. [23p.] (In Swedish). Order Number DE93631743. Source: OSTI; NTIS; INIS.

Radiation protection research programs are summarized. The main fields are: ionizing and non-ionizing radiation, radioactive wastes, radiation accidents, dosimetry, epidemiology, radiobiology and radioecology.

28091 (SSI–93-02) **Survey and evaluation of the external research and development programme 1977-1983 of the Swedish Radiation Protection Institute.** Persson, Lars. Swedish Radiation Protection Inst., Stockholm (Sweden). Jan 1993. [33p.] Order Number DE93631744. Source: OSTI; NTIS; INIS.

A review of the external research programme of SSI is undertaken. The main research programme is in this report divided into five subprogrammes according to the main programmes of the Institute. This report covers research projects reported 1977-1983. An evaluation of the impact of the R and D programme is included in the report. The external R and D research programme of SSI has had an important impact on the radiation protection work in

Sweden. The methods for evaluation of research programmes are also discussed in the report.

28092 (SSI–93-03) **The SSI reviews of the SKB research programs 1992.** Jensen, Mikael. Swedish Radiation Protection Inst., Stockholm (Sweden). Feb 1993. [29p.] (In Swedish). Order Number DE93631745. Source: OSTI; NTIS; INIS.

The Swedish Radiation Protection Institute (SSI) has scrutinized the research programs 1992 of the Swedish Nuclear Fuel and Waste Management Co (SKB). The judgement is that SKB has both the competence and resources to perform the presented research programs.

28093 (ANL/MCS/CP–78726) **Simplification-driven automated partial evaluation.** Boyle, J.M. Argonne National Lab., IL (United States). Mathematics and Computer Science Div. 21 Nov 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9306162–1: ACM SIGPLAN symposium on partial evaluation and semantics based program manipulation, Gothenburg (Sweden), 14-16 Jun 1993). Order Number DE93012890. Source: OSTI; NTIS; GPO Dep.

I describe an automated approach to partial evaluation based on simplification and implemented by program transformations. The approach emphasizes program algebra and relies on canonical forms and distributive laws to expose instances to which simplifications can be applied. I discuss some of the considerations that led to the design of this approach. This design discussion should be useful both in understanding the structure of the partial evaluation transformations, and as an example of how to approach the design of automated program transformations in general. This approach to partial evaluation has been applied to a number of practical examples of moderate complexity, including: the running example used in this paper, proving an identity for lists, and eliminating a virtual data structure from a specification of practical interest. The chief practical barrier to its wider application is the growth of the intermediate program text during partial evaluation. Despite this limitation, this approach has the virtues of being implemented, automated, and able to partially evaluate specifications containing implicit data, including some specifications of practical interest.

28094 (BNL–48968) **Randomized unannounced inspections at any time.** Lu, Ming-Shih. Brookhaven National Lab., Upton, NY (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930533–4: 15. annual symposium of the European Safeguards Research and Development Association: safeguards and nuclear materials management, Rome (Italy), 11-13 May 1993). Order Number DE93014285. Source: OSTI; NTIS; INIS; GPO Dep.

A general model of randomized inspections for unannounced inspections at any time is proposed. The model is designed to satisfy the existing IAEA inspection criteria including both timeliness and detection probability goals. In addition, the inspection effectiveness is enhanced significantly since inspections may commence at any time. Evaluation of the results of inspections implemented according to the model does not require changes in the concept of timeliness or the use of "average" detection time. Potential significant savings in inspection resources arising from the application of the model are estimated.

28095 (CIEMAT–708) **A communication network for LHC detector readout.** Romero, L. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1993. 29p. Order Number DE93502573. Source: OSTI; NTIS.

This paper describe a network architecture for data taking in LHC environment. The network is composed of 64 rings of point to point links working at 100 Mbytes/s. The network connect the front end electronics, computer farms and two data switches. The efficiency of the system is discussed. Using extracted 1 kbyte events for the 2nd level trigger and whole 1 Mbyte events for the 3rd level trigger, then the system can sustain working rates of 2 x 10"5 and 2 x 10"3events/s going into the 2nd and 3rd level triggers. System resistance to errors is discussed. (Author)

28096 (CONF-910414–41) **Parallelization of a spherical S_N algorithm based on the spatial domain decomposition.** Haghighat, A. (Pennsylvania State Univ., University Park, PA (United States). Dept. of Nuclear Engineering); Azmy, Y.Y. Oak Ridge National Lab., TN (United States). [1991]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International topical meeting on advances in mathematics, computation and reactor physics; Pittsburgh, PA (United States); 28 Apr - 2 may 1991. Order Number DE93015816. Source: OSTI; NTIS; GPO Dep.

The SN method is an approximate approach used to solve the linear Boltzmann transport theory equation. This method requires a significant amount of memory and computational time which are limiting factors for its utility in real-life applications. In the past decade, the significant advancements in computer hardware design (vector and parallel processing) have provided the possibility of development of new parallel/vector software which can operate significantly faster than the older serial/scalar ones. In, recent years, several studies have been performed on the vector/parallel processing of the SN transport theory method. This paper primarily discusses a parallel algorithm for the S. method which is based on decomposition of the spatial domain. Wienke and coworkers have performed studies on the energy domain and have obtained significant speedups. Azmy considered angular parallelization of a one-group x-y nodal SN algorithm and recently Rhoades and Flanery performed angular parallelization for a x-y-z SN transport formulation. Haghighat and Mattis considered angular parallelization of a curvilinear SN algorithm. For parallelization based on the spatial domain decomposition only one study has been reported by Yavuz and Larsen who demonstrated the possibility of spatial decomposition for a slab geometry on a sedal machine. In the present work, we develop a spatial parallel formulation for spherical geometry and study its behavior under different physical conditions. Then, we describe our implementation of the algorithm on the Cornell National Supercomputer Facility IBM 3990/600J with six processors and measure speedups for different problem sizes.

28097 (CONF-9210270–, pp. 1-7) **A SISAL code for computing the fourier transform on S_N.** Novoa, J. (Univ. of Puerto Rico, Mayaguez (PR)); Sanmiguel, F.; Seguel, J. Lawrence Livermore National Lab., CA (United States). Dec 1992. Grant RII-8905080. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

Non-abelian FFT's appear in connection with the statistical analysis of ranked data. Fast algorithms for computing non-abelian FFTs that are based upon a generalization of common FFT techniques have been proposed. However, the presence in non-abelian FFTs of group representations makes the coding of a non-abelian FFT much more complex, in particular, no parallel or vector implementations can be naturally derived by manipulating the non-abelian FFT mathematical formulas. In this paper, a SISAL code based on an almost direct translation of the mathematical expression of an FFT on the symmetric group S_N is presented. Especially useful features in SISAL in expressing the algorithm are ragged arrays and dynamic sized arrays.

28098 (CONF-9210270–, pp. 9-20) **Five ways to fill your knapsack.** Boehm, W.; Egan, G. Lawrence Livermore National Lab., CA (United States). Dec 1992. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

We compare five solutions to the zero-one knapsack problem: Divide and Conquer, Depth First with Bound, Dynamic Programming, Memo Functions, and Branch and Bound. Our programs are written in Sisal and run on the CSIRAC II dataflow machine. Two of the algorithms, Memo Functions and Branch and Bound, benefit from non deterministic extensions of Sisal, put and get. We introduce these extensions and compare the performance of the five algorithms using knapsacks of 20 and 40 objects. We measure the performance of our programs in S_1: the number of instructions executed, S_∞: the critical path length, and $\pi = [S_1/S_\infty]$: the average parallelism. It turns out that the Branch and Bound algorithm performs best in terms of S_1, especially for the harder test cases.

28099 (CONF-9210270–, pp. 21-24) **Simulating material dislocation motion in SISAL.** Strailey, M.T. Jr.; Tibbits, P.; DeBoni, T. Lawrence Livermore National Lab., CA (United States). Dec 1992. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

The goal of this project is to develop a computer model in Sisal to simulate the movement of dislocations in metal-class materials undergoing high temperature deformation. The project expands previous work in simulating the movement of dislocations. The new model will be able to handle more dislocations and eventually will model curved dislocation lines in three-dimensional space. It is hoped that this new model will be able to elucidate the mechanism by which Persistent Slip Bands (PSB's) form. The decision to implement the model in Sisal was influenced by the Sisal Scientific Computing Initiative's offer of free supercomputer time. The model tracks the motion of the dislocations by solving a system of coupled ordinary differential equations. The heart of our simulation then is the Runge-Kutta-Fehlberg integrator used to solve this system of equations. This process is expected to parallelize well because identical computations are used for each of the dislocations. With the integrator recently completed and only preliminary results available, the main focus of this paper will be on our experiences with using Sisal to implement a preliminary project, the simulation of dislocation pileup formation. This simulation will be used to verify our results against previous simulations and the analytical results.

28100 (CONF-9210270–, pp. 25-34) **Candis as an interface for SISAL.** Raymond, D.J. (Geophysical Research Center, Socorro, NM (US)). Lawrence Livermore National Lab., CA (United States). Dec 1992. Grant ATM-8914116. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

Candis stands for "C language analysis and display", and is a system developed by the author for analyzing and displaying gridded numerical data. It has been in regular use at New Mexico Tech for a number of years, and is being used at a number of other institutions as well. The basic idea of Candis is to apply the UNIX filter paradigm to non-ASCII, gridded numerical data. In order to make this possible, a standardized, self-describing data format has been adopted. Details can be found in Raymond (1988). The advantage of this system is that complex applications can be constructed by piping together a number of standard Candis utilities. Its main applications have been the analysis and display of data from meteorological observation systems and the analysis of numerical model output. Both of these applications typically have data in the form of rectangular grids of varying dimensions. In this paper I describe an interface between Candis and SISAL (McGraw, et. al, 1985). For SISAL applications that produce gridded numerical data, this provides a simple way to take advantage of the strengths of both systems - computations are done using SISAL and the results are analyzed using Candis.

28101 (CONF-9210270–, pp. 35-43) **Parallelisation and performance of the Burg Algorithm on a shared memory multiprocessor.** Cricenti, A.L. (Swinburne Institute of Technology, Hawthorn (AU)); Egan, G.K. Lawrence Livermore National Lab., CA (United States). Dec 1992. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

This paper describes the implementation of a signal processing algorithm, specifically the Burg Algorithm, using both a high level at parallel language SISAL and Encore Parallel FORTRAN. The Burg Algorithm is an estimation technique for fitting an autoregressive model to a time series data set. This algorithm contains a time shift/timer product operation which is used in a number of other important signal processing algorithms such as convolution. The paper describes the results obtained using both the high level parallel language SISAL and EPF, on both an ENCORE Multimax multiprocessor machine, and a single processor IBM RS6000/530 machine.

28102 (CONF-9210270–, pp. 45-57) **Use of genetic algorithms in SISAL to solve the file design problem.** Cedeno, W. (Lawrence Livermore National Lab., CA (US)). Lawrence Livermore National Lab., CA (United States). Dec 1992. DOE Contract W-7405-ENG-48. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

The File Design Problem is a N-P-complete problem normally encountered in the design of databases. The goal is to find an assignment of database records to files that minimizes the average number of files examined over all single attribute queries. This paper describes a solution to the File Design Problem using Genetic Algorithms written in SISAL. Using the portability and architecture independence inherent in SISAL a Genetic Algorithm model is defined that provides increased performance without the sacrifice of convergence. A heuristic based mating operator essential to the solution to the problem is described. Selection and replacement operators useful for multimodal function optimization are used to search for multiple solutions. Results with various test cases are shown. Performance of the algorithm is shown for different platforms.

28103 (CONF-9210270–, pp. 59-65) **Implementing FFT's in SISAL.** Bollman, D. (Univ. of Puerto Rico, Mayaguez (PR)); Sanmiguel, F.; Seguel, J. Lawrence Livermore National Lab., CA (United States). Dec 1992. Grant RII-8905080. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

Tensor notation is a powerful tool for improvising fast Fourier transform (FFT) algorithms in a functional language. In this work we apply this idea to the development of FFT's in the functional language Sisal. As an example, we develop a high performance Sisal implementation of a variant of Pease's FFT on a Cray Y-MP. Although the utility of tensor notation for FFT algorithms has long been recognized, it has been only recently that this notation has gained wide spread acceptance by FFT practitioners. Tensor notation aids not only in algorithm expression and comprehension, but also in algorithm development and is an ideal tool for developing parallel-vector algorithms for functional programs. In this work we describe work in progress that exploits this idea to develop a family of high performance FFT's in the functional language Sisal. As an example, we present a high performance Sisal implementation of a variant of the radix 4 Pease algorithm. In this section, we establish definitions and notation. In Section 2, we review a well-known family of FFT's that are variants of the original Cooley-Tukey algorithm and discuss their implementations in Sisal. In Sections 3 and 4 we compare Sisal implementations of variants of the radix 4 Korn-Lambiote and Pease algorithms. The Pease variant outperforms Korn-Lambiote as well as Cann's implementation of Stockham's algorithm.

28104 (CONF-9210270–, pp. 67-82) **Programming and evaluating the performance of signal processing applications in the SISAL programming environment.** Yoon, Daekyun (Univ. of Southern California, Los Angeles (US)); Gaudiot, J.L. Lawrence Livermore National Lab., CA (United States). Dec 1992. Grant CCR-9013965. From 2. sisal users' conference; San Diego, CA

(United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

This paper presents a signal processing application and its implementation in the SISAL programming environment. It shows that a signal processing application can be effectively coded in SISAL and can be analyzed to investigate the feasibility of its parallel implementation using the SISAL tools. We also present the implementation of Fast Fourier Transform (FFT) which is a kernel of many signal processing applications on the Sequent Symmetry systems. It is shown that exploiting function call parallelism can be more effective than the parallel loop slicing for some applications.

28105 (CONF-9210270–, pp. 83-92) **SISAL and Von Neumann-based languages: Translation and intercommunication.** Yoshikawa, C. (Univ. of Cincinnati, OH (US)); Ghia, U.; Osswald, G.A. Lawrence Livermore National Lab., CA (United States). Dec 1992. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

SISAL is a functional programming language useful for creating programs that can be easily exploited for parallelism, run on a wide range of platforms (Cray, Iris, IBM RS/6000, etc.), and run at serial speeds competitive with FORTRAN. In order to take advantage of SISAL's speed and parallelism, however, it is necessary to extensively rewrite existing FORTRAN code or create new code m SISAL. Translating from a language such as FORTRAN to SISAL is not particularly easy, since SISAL's data is comprised of semantically immutable values. Therefore, it was decided to test the performance of a combination of a FORTRAN driver and a SISAL subroutine. Consequently, extensive rewriting of the original FORTRAN code is not necessary and the program performance can be expected to increase due to SISAL's decided advantages. Since documentation of a FORTRAN/SISAL interface is not widespread and the corresponding performance is not well understood, what data should be examined to evaluate the resulting performance is itself an area of investigation. However, the experience and information acquired concerning the functional and Von Neumann language interface should prove to be didactic, at worst. The present paper attempts to identify the approach needed to translate code and create the interface, while detailing the communication between a FORTRAN driver and a SISAL subroutine. Also, the performance gain or loss will be reviewed.

28106 (CONF-9210270–, pp. 93-109) **An IF2 code-generator for ADAM architecture.** Mitrovic, S. (Institut fuer Technische Informatik und Kommunikationsnetze, Zuerich (CH)). Lawrence Livermore National Lab., CA (United States). Dec 1992. Grant 2.309-0.86. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

Project ADAM is based on research work in the area of parallel computers. ADAM architecture can be described as von Neumann/dataflow hybrid or coarse-grain dataflow architecture. The project encompasses development and analysis of a novel parallel architecture and corresponding tools. A register-level simulator allows quick changes of design parameters and a detailed monitoring of machine behavior. Programmability of architecture can be proved only by running existing programs written in high-level languages. Therefore, research results are obtained with an architecture simulator and code-generators for high-level languages. The detailed simulator called Metamachine was implemented and a processing element was realized in hardware. Software environments, new languages for parallel processors and a code-generator for applicative language Sisal have been programmed by members of ADAM project. The project involved seven people over a period of five years. The research work resulted in various software tools and a number of experiments that verified the performance and illuminated the problems of ADAM architecture. This paper presents one part of ADAM project. It describes the code-generator that uses IF2 intermediate form to generate assembler code for Metamachine. IF2 is generated by optimizing SISAL compiler system (OSC) [FeoCannOldeh9O]. The author assumes that the reader has a knowledge of Sisal and its syntax [McGrSkedz85]. IF1 [SkedzGlau84] and IF2 [WelSkeYaRan86] graphs are hierarchic acyclic dataflow graphs that are stored in text files.

28107 (CONF-9210270–, pp. 111-137) **Program partitioning for NUMA multiprocessor computer systems.** Wolski, R. (Lawrence Livermore National Lab., CA (US)); Feo, J. Lawrence Livermore National Lab., CA (United States). Dec 1992. DOE Contract W-7405-ENG-48. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

An important part of parallel programming is program partitioning and scheduling. Partitioning is the separation of program operations into sequential tasks, and scheduling is the assignment of tasks to the processors of a computer system. To be effective, automatic methods require an accurate representation of the model of computation and the target architecture. Current partitioning methods assume the macro-dataflow model of computation and the homogeneous/two-level architectural model. The former is typically represented as a directed, acyclic graph of computation nodes and communication edges. The edges map directly to communication channels, but not read/write memories. Consequently, current methods optimize assuming the presence of communication channels, and not the complex memory systems of NUMA architectures-they fail to optimize for a critical component of these architectures. In this paper, we extend the conventional graph representation of the macro-dataflow model to enable mapping heuristics to work with a NUMA architectural model. We describe two such heuristics. Simulated execution times of programs show that our model and heuristics generate higher quality program mappings than current methods.

28108 (CONF-9210270–, pp. 139-159) **Mapping functional parallelism on distributed memory machines.** Pande, S.S. (North Carolina State Univ., Raleigh (US)); Agrawal, D.P.; Mauney, J. Lawrence Livermore National Lab., CA (United States). Dec 1992. Grant DDAL03-91-G-0031. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

In order to effectively use the power of newer massively parallel multicomputers, exploitation of functional parallelism in a program with automatic data and code distribution, is a necessity. Functional paradigm offers a relative ease of generating an intermediate form that abstracts the DAG parallelism in the program, in an interprocedural framework. Using the Sisal intermediate form IF-2, a new task-based methodology has been outlined to effectively map functional parallelism on distributed memory multicomputers. A new compile time method that investigates the trade-off between the schedule length and the number of required processors, partitions the IF-2. The partition is appropriately scaled at run time to match the available processors, to avoid recompilation. The run time system is designed around an arbitrator processor and several worker processors. The arbitrator processor manages the control thread of the Sisal program and is also responsible for the housekeeping jobs like task assignment to the workers and ownership resolution of the task variables. Each of the workers await tasks to be assigned by the arbitrator and use the ownership information maintained at the arbitrator to obtain the live definition of a variable. Many implementation issues related to supporting call by value and virtual address mechanism are addressed. Benchmark results are presented to demonstrate the viability of the approach.

28109 (CONF-9210270–, pp. 161-173) **Implicit array copying: Prevention is better than cure.** Roe, P. (Univ. of Adelaide (SA)); Wendelborn, A. Lawrence Livermore National Lab., CA (United States). Dec 1992. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

SISAL is a purely functional language which supports arrays. The difficulty with supporting purely functional arrays is that a prohibitive amount of copying can be necessary. SISAL uses a sophisticated compile-time analysis to alleviate some copying

associated with array operations. This compile-time analysis is discussed and some problems with it are exposed. The alternative to curing, copying, is to prevent it. To this end we propose a linear ADT, inspired by Wadler's monads work. Our linear ADT may be incorporated into Haskell and other functional languages. It allows efficient functional assignment on arrays. In addition it allows efficient divide and conquer style algorithms to be expressed using array partitioning and concentation. The latter is particularly useful for expressing parallel array algorithms.

28110 (CONF-9210270–, pp. 175-191) **Mathematical syntax for SISAL.** Arya, A.K.; Woods, D. Lawrence Livermore National Lab., CA (United States). Dec 1992. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

This paper presents a mathematical syntax which can be generated from SISAL 2.0 and the tool to generate this mathematical form automatically. This tool is envisioned to be incorporated into a SISAL 2.0 translator. We contend that a mathematical syntax would be closer to a native language for computer users especially those well founded in mathematics. In addition, this mathematical form is suitable for overheads and textbook with the added benefit that the mathematical form is guaranteed to be syntatically correct. This will enhance the understandability presented programs. The example translations contained here are intended as a starting point for standardizing on mathematicalized SISAL and would be interested in others peoples ideas. There is no reason to prevent the extension of our approach to arbitrary functional languages.

28111 (CONF-9210270–, pp. 193-208) **An approach for optimizing recursive functions.** Fitzgerald, S.M. (Univ. of Massachusetts, Lowell (US)); Wilkens, L. Lawrence Livermore National Lab., CA (United States). Dec 1992. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

Within the SISAL programming environment, existing optimization techniques do not address recursive functions. This limitation restricts the performance of many applications. One approach is to transform recursive solutions into their iterative counterparts, thus allowing existing techniques to optimize the resulting form. In this paper, we discuss the issues involved in converting a recursive function into an equivalent iterative form. An outline of an algorithm which performs a source-to-source transformation on tail recursive SISAL functions is presented. We then discuss the issues involved in generalizing this approach.

28112 (CONF-9210270–, pp. 209-222) **Implementing arrays in SISAL 2.0.** Oldehoeft, R.R. Lawrence Livermore National Lab., CA (United States). Dec 1992. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

In this report we outline an implementation technique for arrays in SISAL 2.0 as well as in other parallel programming languages. To preserve the efficiency of array access required for parallel systems with either shared memory or distributed memory, we rely on organizational opportunities first observed while working through the design of SISAL 2.0. We had three goals in the redesign of array facilities for SISAL. First, the currently implemented version of SISAL, 1.2, has some redundancy among array operations that we wanted to simplify without losing expressive power or convenience. Second, experience showed us that we need true multi-dimensional arrays (as well as arrays of arrays). Third, other languages with arrays define operations analogous to those on scalars that work element-by-element on array operands, so we defined this expressive power for SISAL arrays. The distribution of array objects among the processor-memory pairs of distributed-memory parallel systems is a subject of significant current study. The development of explicit distribution techniques embedded in programming languages is exemplified by PCF Fortran. Fortran D uses programmer-defined declarations as well as compiler optimization to improve efficiency. Automatic data alignment is the goal of several projects. Another major group of research projects aims to preserve the illusion of a single shared memory on distributed-memory multiprocessors. These distributed shared-memory systems may be tied to programming languages or may be operating system based. Different systems implement versions of coherence, but most keep track of fixed-size pages containing shared data. Our goal is to provide an efficient implementation that is similar for both shared-memory and distributed-memory parallel systems.

28113 (CONF-9210270–, pp. 223-241) **FOL: An object oriented extension to the SISAL language (extended abstract).** Pantel, M. (IRIT/ENSEEIHT, Toulouse (FR)); Gandriau, M.; Salle, P. Lawrence Livermore National Lab., CA (United States). Dec 1992. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

This paper describes an improvement of the reusability model of the SISAL language. The study of the object oriented paradigm limits leads us to propose several extensions promoting a higher reusability scheme. The paper contains the description of the FOL language and of its translator to SISAL as well as insights in our future work on impure effects.

28114 (CONF-9210270–, pp. 243-255) **Twine: A portable, extensible SISAL execution kernel.** Miller, P.J. Lawrence Livermore National Lab., CA (United States). Dec 1992. DOE Contract W-7405-ENG-48. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

Functional programs are very much like black boxes - inputs are applied to programs that produce outputs. We need tools to help us peer into these boxes and find out what's going on. Some of the traditional tools programmers use to augment programs (print statements, monitors, histogrammers) are impossible to describe in the functional paradigm. This paper presents ways to instrument a computational engine that is simulating a functional execution. The TWINE engine executes a serialized, complied version of Sisal's intermediate form IF1. The tool generation environment compiled allows moderately sophisticated users to write packages that can instrument running Sisal programs. The engine provides a clean abstraction of the execution, so the tool writer does not have to worry as much about the internal execution of the program.The engine talks to tools through an event-driven interface. This paper gives an overview as to how the engine works, and how Sisal codes are compiled for it. The paper concludes with an example which constructs an instrument which monitors array sizes.

28115 (CONF-9210270–, pp. 257-270) **Investigating the memory performance of the optimising SISAL compiler.** Engelhardt, D. (Univ. of Adelaide (AU)); Wendelborn, A. Lawrence Livermore National Lab., CA (United States). Dec 1992. From 2. sisal users' conference; San Diego, CA (United States); 4-5 Oct 1992. In *Proceedings of the second SISAL users' conference.* 273p. Order Number DE93008019. Source: OSTI; NTIS.

This paper describes additions made to the runtime system of OSC v12.7 which allow details of memory usage to be collected at discrete time steps. We also discuss experiments we have carried out with the aid of this tool, and describe how these experiments have helped us gain a better understanding of the memory characteristics of OSC and its optimisations. We further show how this understanding has enabled us to hand-optimise the memory performance of our programs to produce optimal memory performance.

28116 (CONF-9305151–, pp. 15, Paper 1) **A prototype distributed audit system using network management protocols.** Banning, D.L. (SPARTA, Inc., Torrance, CA (US)). USDOE Office of Administration and Management, Washington, DC (United States). [1993]. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected.* 244p. Order Number DE93011853. Source: OSTI; NTIS.

Security auditing systems are used to detect and assess unauthorized or abusive system usage. Historically, security audits were

confined to a single computer system. Recent work examines ways of extending auditing to include heterogeneous groups of computers (distributed systems). This paper describes the design and prototype development of a Distributed Audit System (DAS) which was developed with funding received from Lawrence Livermore Laboratory and through the Master's thesis effort performed by the author at California State University, Long Beach. The DAS uses network management protocols to provide collection, transfer, and control of audit data on distributed, heterogeneous hosts. 6 refs.

28117 (CONF-9305151–, pp. 14, Paper 2) **Using UNIX system auditing for detecting network intrusions.** Christensen, M.J. (Lawrence Livermore National Lab., CA (US)). USDOE Office of Administration and Management, Washington, DC (United States). [1993]. DOE Contract W-7405-ENG-48. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected.* 244p. Order Number DE93011853. Source: OSTI; NTIS.

Intrusion Detection Systems (IDSs) are designed to detect actions of individuals who use computer resources without authorization as well as legitimate users who exceed their privileges. Although significant progress is being made in IDS research, at present IDSs are no panacea. This paper describes a different approach, namely a decision aiding approach to intrusion detection. The introduction of a decision tree represents the logical steps necessary to distinguish and identify different types of attacks. This tool, the Intrusion Decision Aiding Tool (IDAT), utilizes IDS-based attack models and standard Unix audit data. Since attacks have certain characteristics and are based on already developed signature attack models, experienced and knowledgeable Unix system administrators know what to look for in system audit logs to determine if a system has been attacked. Others, however, are usually less able to recognize common signatures of unauthorized access. Users can traverse the tree using available audit data displayed by IDAT and general knowledge they possess to reach a conclusion regarding suspicious activity. IDAT is an easy-to-use window based application that gathers, analyzes, and displays pertinent system data according to Unix attack characteristics. IDAT offers a more practical approach and allows the user to make an informed decision regarding suspicious activity. 21 refs., 8 figs.

28118 (CONF-9305151–, pp. 18, Paper 3) **The potential role of quantum cryptography for secure private communications.** Feingold, R. (Lawrence Livermore National Lab., CA (US)). USDOE Office of Administration and Management, Washington, DC (United States). [1993]. DOE Contract W-7405-ENG-48. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected.* 244p. Order Number DE93011853. Source: OSTI; NTIS.

This paper examines progress in quantum cryptography, its future potential, and explores how this new methodology might mesh with the increasing needs for secure private communications. From the perspective of a computer security specialist, this paper investigates and fosters understanding of these topics. The intended audience of management and technical people interested in computer and network security requires no special background or expertise. Ingenious research in quantum physics has created a bold possibility for the future of cryptography. Current practical cryptographic technologies attempt to assure privacy by means of secret keys or one-way mathematical functions-those functions that even enormous expenditures of time and computational resources cannot invert. However, an attacker may compromise these methods through discovery of the secret keys, sophisticated as well as brute force cryptanalytic attacks, computationally feasible inversion of the mathematical functions, or by intercepting, altering, and then retransmitting the messages. Remarkably, in the last few years researchers have proposed combining quantum physical properties with tangible apparatus to implement a new cryptographic methodology-quantum cryptography. The latter offers the potential of assuring privacy through fundamental physical laws. An eavesdropper with unlimited computing power could not compromise quantum cryptographic transactions. Further, correspondents would know immediately whether or not an eavesdropper was monitoring their communications. 30 refs., 3 figs.

28119 (CONF-9305151–, pp. 11, Paper 4) **The steps to SATURN: Security planning.** Harris, D.D. (Allied-Signal Aerospace Co., Kansas City, MO (US)). USDOE Office of Administration and Management, Washington, DC (United States). [1993]. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected.* 244p. Order Number DE93011853. Source: OSTI; NTIS.

To better serve its customers, both external and internal, the DOE Kansas City Plant (KCP) has initiated a project to create an enterprise network for unclassified data. This paper will focus on the security aspects of the enterprise data network and will also present an overview of the current and planned network at the KCP. The first part of the paper provides the background information for the rest of the presentation. It addresses the question "Why a network?" and then describes some of the challenges met in developing the KCP enterprise data network to its current state. The process of developing security guidelines and policies for the enterprise network comprises the major portion of this paper. It presents a rationale for requiring security in an unclassified environment, then describes how KCP associates developed a set of guidelines and policies for users of the network. After presentation of this paper a panel of KCP associates will answer questions about the process and also quiz attendees about their own networks. The panel hopes that this question and answer session will allow further improvements in the process as well as in the resulting updated guidelines and policies. 1 fig.

28120 (CONF-9305151–, pp. 25, Paper 5) **Addressing the insider threat.** Hochberg, J.C. (Los Alamos National Lab., NM (US)); Jackson, K.A.; McClary, J.F.; Simmonds, D.D. USDOE Office of Administration and Management, Washington, DC (United States). [1993]. DOE Contract W-7405-ENG-36. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected.* 244p. Order Number DE93011853. Source: OSTI; NTIS.

Computers have come to play a major role in the processing of information vital to our national security. As society grows more dependent on computers, it also becomes more vulnerable to their misuse. Misuse may be accidental, or may occur deliberately for purposes of personal gain, espionage, terrorism, or revenge. While it is difficult to obtain exact statistics on computer misuse, clearly it is growing. It is also clear that insiders – authorized system users – are responsible for most of this increase. Unfortunately, their insider status gives them a greater potential for harm. This paper takes an asset-based approach to the insider threat. The authors begin by characterizing the insider and the threat posed by variously motivated insiders. Next, the asset of concern is characterized: computerized information of strategic or economic value. Four general ways in which computerized information is vulnerable to adversary action by the insider are discussed: disclosure, violation of integrity, denial of service, and unauthorized use of resources. Finally, the authors look at three general remedies for these vulnerabilities. The first is formality of operations, such as training, personnel screening, and configuration management. The second is the institution of automated safeguards, such as single-use passwords, encryption, and biometric devices. The third is the development of automated systems that collect and analyze system and user data to look for signs of misuse. 37 refs.

28121 (CONF-9305151–, pp. 7, Paper 6) **Microcomputer resource inspection/self-inspection program.** Hockett, E.L. Jr. (Oak Ridge Y-12 Plant, TN (US)); Marlow, K.A. USDOE Office of Administration and Management, Washington, DC (United States). [1993]. DOE Contract AC05-84OR21400. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training*

conference: Mission possible: Connected and protected. 244p. Order Number DE93011853. Source: OSTI; NTIS.

A Computer Security Program is not just a concept. It is real action by real people. Under direction of DOE Orders, Martin Marietta Energy Systems, Inc., personnel have developed a Microcomputer Security Program at the Oak Ridge Y-12 Plant that is both effective and sensible. The Computer Security Program at the Y-12 Plant is structured to provide a clear chain of functional responsibility. Additionally, the program allows for effective communication channels to exist from the Computer Security Site Manager/Computer Protection Program Manager to approximately 6000 users. Annually, the Division Computer Security Officer is required to assist the Y-12 Plant Computer Security Officer in performing a formal Microcomputer Security Inspection within his/her division. This article describes the inspection program, including discussions on the inspection schedule, inspection notification, the actual inspection, reporting the results of an inspection, and corrective actions and follow-up.

28122 (CONF-9305151–, pp. 14, Paper 7) **PC security products characteristics to consider.** Krehnke, M.E. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (US)). USDOE Office of Administration and Management, Washington, DC (United States). [1993]. DOE Contract AC05-84OR21400. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected.* 244p. Order Number DE93011853. Source: OSTI; NTIS.

This paper presents the viewpoint that the appropriate response to increased computer security vulnerability is a multifaceted approach to personal computer (PC) security, incorporating physical security, administrative controls, and technical security measures. One objective of this paper is to make the reader aware of the limitations of PC security products, despite the vast number of products and product options which are now available on the market. Another objective is to emphasize that a product will not provide security if it does not meet the security requirements of the environment in which it will be implemented. Information regarding PC vulnerabilities, the functions and characteristics of PC security products that respond to those vulnerabilities, and ways in which PC security products can be circumvented are presented. 4 refs.

28123 (CONF-9305151–, pp. 18, Paper 8) **An alternative to SneakerNet.** Orrell, S. (EG&G Energy Measurements, Inc., Albuquerque, NM (US)); Ralstin, S. USDOE Office of Administration and Management, Washington, DC (United States). [1993]. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected.* 244p. Order Number DE93011853. Source: OSTI; NTIS.

Information security systems can provide only conditional protection that takes the form of detection and sanction of violations. Design of any computer security system or procedure should recognize that information security violations can only be deterred. Security plans for classified computer systems often specify that only a small percentage of the data processed will be classified. Thus, the bulk of the data on such secure systems is unclassified. This situation requires that some mechanism be provided for moving files to or from the open environment. This has been accomplished by writing selected files to a magnetic medium and carrying it to another system where the files are retrieved. These procedures have often been developed informally and ad hoc to a specific transfer requirement. This media transport process, referred to as sneakernet, often is manually logged and controlled only by administrative procedures. While sneakernets may isolate secure systems from direct attacks, other security concerns remain. This paper examines the security concerns associated with transfers of unclassified files between security environments and develops a set of criteria which can be used in evaluating the security of any system or procedure for that purpose. Methods for bi-directional unclassified file transfer between secure and open environments could range from completely manual to fully automated. The criteria developed are intended to be generic and to apply to any system for the purpose, existing or proposed.

28124 (CONF-9305151–, pp. 10, Paper 10) **Verification of security controls on classified systems.** Pees, J.B. (ManTech Strategic Associates, Ltd., Fairfax, VA (US)). USDOE Office of Administration and Management, Washington, DC (United States). [1993]. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected.* 244p. Order Number DE93011853. Source: OSTI; NTIS.

Verification of security controls on classified systems is an essential function that must be accomplished prior to initial operation and at regular intervals throughout the system life-cycle. Security controls are not only applied at different stages during the system life-cycle, including development, testing, and operation, but are applied at different levels, including the application, system, and network levels. This article addresses verification of controls at the application, system, and network level. The proper functioning of security controls must be verified to ensure that classified information is adequately protected once the system is operational. Verification activities are performed by several types of individuals, each with allied but distinct responsibilities. Developers, certifying officials, accrediting authorities, and inspectors all perform verification functions. Of primary interest are the verification activities used during the certification and inspection processes. Although the purpose of each process is different, the methods used to verify security controls are similar. The methods and evaluation tools described can be used by either certifying officials or inspectors to verify controls and assess the level of protection provided by those controls.

28125 (CONF-9305151–, pp. 13, Paper 11) **Kerberos: A UNIX-TCP/IP network authentication system.** Rahe, W.H. (Sandia National Laboratories, Albuquerque, NM (US)); Machin, G.D. USDOE Office of Administration and Management, Washington, DC (United States). [1993]. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected.* 244p. Order Number DE93011853. Source: OSTI; NTIS.

Distributed computing requires security restrictions to limit unauthorized usage of valuable computing resources as well as the privacy and/or integrity of critical corporate and personal information. Reliable authentication is the primary source of all computer security. Resource authorization, accounting, and audit of a distributed computing environment mandate that the authenticity of each customer be unique and well-determined prior to access to any computing resources in the distributed environment. Operating systems based on "UNIX®" have been installed throughout Sandia National Laboratories (SNL) on numerous workstation platforms as well as on the "Central Service" nodes. Authentication of customers on many computer systems is provided by the individual computing resource through the use of "passwords." In the traditional UNIX environment, each computing resource relies on a local authentication/authorization file (frequently/etc/password) for access control. In recognition of the difficulties in multiple authentication, Digital Equipment Corporation (DEC) and International Business Machines (IBM) provided funding for the creation of Project Athena at the Massachusetts Institute of Technology to address distributed computing including security. Kerberos™ is an application developed by Project Athena to provide centralized third-party authentication in a distributed network. Network access control may be provided by Kerberos for each of the computing resources within either a local or remote network. This article further discusses the specifications and applications of Kerberos. 14 refs., 8 figs., 1 tab.

28126 (CONF-9305151–, pp. 19, Paper 12) **Still stalking the wily hacker: A case study of network intrusions from overseas.** Schultz, E.E. (Eugene Schultz and Associates, Livermore, CA (US)); Kuhn, D.R.; Howard, V. USDOE Office of Administration and Management, Washington, DC (United States). [1993]. From

15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected.* 244p. Order Number DE93011853. Source: OSTI; NTIS.

Cliff Stoll helped awaken the American public to the threat of intrusions into US computers from overseas. Stoll's descriptions of intrusions that occurred between 1986 and 1988 are by no means exhaustive accounts of such intrusions; there has been a steady stream of intrusions into US computers since the time of Stoll's accounts. Last year the National Institute of Standards and Technology (NIST) initiated and completed a study of intrusions into US Government computers originating from overseas in 1990. This paper presents the major findings and conclusions from this unclassified study. There was a large number of intrusions into a variety of UNIX and VMS computers connected to the Internet and Milnet. The attacker(s) generally first used a network information center (NIC) to locate computers to attack. Although there were several distinct attack signatures (described in detail in this paper) during three distinct phases of activity, most attack methods focused on exploiting weak passwords, then escalating privilage(s). There were also identifiable attacks routes, although the particular host systems, sites, and/or US agencies and departments involved are withheld. In many cases, the attacker(s) first intruded into an account long enough only to establish that the account could be compromised, then transferred files from that account several weeks later. The success rate of intrusions was low at first, but increased over time. These intrusions lead to numerous "lessons learned." Most fundamentally, the intrusions and other attacks demonstrate the severity of the continued overseas threat upon US computers. Measures that network administrators, system managers, and users could have employed to prevent these and similar network intrusions are discussed in this paper. Better password selection would have deterred more of these attacks than any other measure. 4 refs.

28127 (CONF-9305151–, pp. 9, Paper 13) **Automated information systems security inspection tools.** Smoot-Wood, D.; Seeger, J. USDOE Office of Administration and Management, Washington, DC (United States). [1993]. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected.* 244p. Order Number DE93011853. Source: OSTI; NTIS.

The Office of the Deputy Assistant Secretary for Security Evaluations (SE) inspects computer security programs at the Department of Energy (DOE) Headquarters and field offices to evaluate the status of protection provided to national security interests and program operations involving the use of automated information systems. To support this process, SE has developed automated performance tests, computer software-based tools, and structured methodologies which are an essential element of the computer security inspection topic. This paper describes how these inspection techniques evolved and the benefits derived from their use. 1 fig.

28128 (CONF-9305151–, pp. 8, Paper 14) **The Network Database.** Starcher, A. (Sandia National Laboratories, Albuquerque, NM (US)). USDOE Office of Administration and Management, Washington, DC (United States). [1993]. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected.* 244p. Order Number DE93011853. Source: OSTI; NTIS.

UNIX is an operating system designed on the 'do your own thing' premise with free, open connectivity to files, machines and networks. This has been proven to be a wonderful thing on small, open access systems where everyone knows everyone else and none of the data is even remotely private, much less classified. In the world of large networks and/or secure computing however, the afore mentioned aspects of UNIX that made it initially so attractive, tend to quickly become an administrative nightmare. When Sandia central computing announced it was moving to a UNIX environment, it received a request from existing UNIX users and system administrators at Sandia. They had been involved with UNIX for years before the central site decided to make the move and had been through the headaches and pitfalls of the system. They wanted something that could use to make a sometimes unruly system more manageable. The Network Database is that tool. It is designed to make the potentially chaotic UNIX/networking environment more orderly and much easier to manage. To accomplish this, it uses the Network Naming Conventions as its basis and ensures uniqueness of any of several items that could cause conflict if duplicated.

28129 (CONF-9305151–, pp. 6, Paper 15) **Developing and implementing a software management program.** Tussing, D.D. (Argonne National Lab., IL (US)). USDOE Office of Administration and Management, Washington, DC (United States). [1993]. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected.* 244p. Order Number DE93011853. Source: OSTI; NTIS.

The Department of Energy issued DOE Order 1330.1C in January 1990, for the purpose of "establishing policies and responsibilities for computer software management." The Order was revised in May 1992 to reflect organizational changes and issued as DOE Order 1330.1D. The Order pertains to all DOE elements, including management and operating contracts, and applies to "software proposed for use, under development, and being maintained and used, whether developed in-house, licensed from a vendor, obtained from another organization, or otherwise acquired." Software management and computer protection are tied closely together. Software management must address inventory management, configuration management, and development management. These three areas must address disaster recovery/business continuation, contingency planning, virus detection and control, compliance with license restrictions (individual and network), and other control issues. Individuals charged with computer protection are often, by default, also assigned these responsibilities. Argonne National laboratory (ANL) has adopted a graded methodology to implement a program for software management that will incorporate quality assurance, configuration management, development management, and inventory management into a single program. ANL will take credit for program aspects currently in place and will adopt reasonable practices to implement the remaining areas of the Order. The Software Management Program described here fulfills the DOE order requirements and allows particular divisions the latitude to determine appropriate requirements for software within their divisions. 1 fig.

28130 (CONF-9305151–, pp. 23, Paper 17) **How do you get people to pay attention to computer security?.** Warshawsky, G.S. (Lawrence Livermore National Lab., CA (US)). USDOE Office of Administration and Management, Washington, DC (United States). [1993]. DOE Contract W-7405-ENG-48. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. A Computer Security Education and Awareness Program can reach many people in a variety of ways. The use of attention grabbers can add excitement and interest to your Awareness Program. Create a recognizable character to spread the word about computer security. Make use of Closed Circuit Television (CCTV) and VCR technology to liven up an Education and Awareness Program. Computer Security videos can be shown on CCTV giving many people the opportunity to view them simultaneously. Humor can be used in presentations and in a variety of publications. Develop an Outreach Program that can provide computer security professionals with a positive voice in the community. Invest in the future by providing computer security awareness to children and adults today. This session will share some of the successful attention grabbing techniques and strategies used in the Lawrence Livermore National Laboratory's Computer Security Continuing Education and Awareness Program.

28131 (CONF-9305151–, pp. 15, Paper 18) **Securing electronic mail: The risks and future of electronic mail.** Weeber, S.A. (Lawrence Livermore National Lab., CA (US)). USDOE Office of Administration and Management, Washington, DC (United States). [1993]. DOE Contract W-7405-ENG-48. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected.* 244p. Order Number DE93011853. Source: OSTI; NTIS.

The network explosion of the past decade has significantly affected how many people conduct day to day work. Network services such as electronic mail, file transfer, and network newsgroups are increasingly relied upon to collect and distribute information. Unfortunately, few of the network services in use today were designed with the security issues of large heterogeneous networks in mind. In particular, electronic mail, although heavily relied upon, is notoriously insecure. Messages can be forged, snooped, and even altered by users with only a moderate level of system proficiency. The level of trust that can be assigned at present to these services needs to be carefully considered. In the past few years, standards and tools have begun to appear addressing the security concerns of electronic mail. Principal among these are RFC's 1421, 1422, 1423, and 1424, which propose Internet standards in the areas of message encipherment, key management, and algorithms for privacy enhanced mail (PEM). Additionally, three PEM systems, offering varying levels of compliance with the PEM RFC'S, have also recently emerged: PGP, RIPEM, and TIS/PEM. This paper addresses the motivations and requirements for more secure electronic mail, and evaluates the suitability of the currently available PEM systems. 13 refs., 3 figs.

28132 (CONF-9305151–, pp. 10, Paper 16) **UNICOS security testing.** Vandevender, W.H. (Sandia National Laboratories, Albuquerque, NM (US)). USDOE Office of Administration and Management, Washington, DC (United States). [1993]. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected.* 244p. Order Number DE93011853. Source: OSTI; NTIS.

Developing security plans and supporting security tests is a very important part of the Department of Energy accreditation process. This paper will discuss the general testing methodology that was used to achieve DOE accreditation of the Secure UNICOS environment at Sandia National Laboratories (NM). In addition, some specific security testing procedures, tests and problem areas will be described. 2 figs., 1 tab.

28133 (CONF-9305207–1) **Hybrid pattern recognition system capable of self-modification.** Glover, C.W. (Oak Ridge National Lab., TN (United States)); Oblow, E.M.; Rao, N.S.V. Oak Ridge National Lab., TN (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Grant: INF-90-015. From 2. international conference on information and knowledge management; Washington, DC (United States); 1-5 May 1993. Order Number DE93015442. Source: OSTI; NTIS; GPO Dep.

Systems capable of recognizing and learning two-dimensional patterns can be used in imaging systems and robotic perception systems. The symbolic and neuromorphic methods for pattern processing problems of this type are complementary in character. We present a hybrid system that utilizes components of symbolic and neuromorphic type; we employ two hybrid components that simultaneously operate up on the same data to produce hypotheses about the data. To resolve the potential conflicts in these hypotheses, we propose a method that learns a combination rule based on a set of examples. We employ the method of empirical risk minimization and does not require knowledge about the error probability distributions of the modules. We are building a prototype system to recognize control panels using a vision system.

28134 (CONF-930781–1) **Decentralized control of uncertain systems via sensitivity models.** Schoenwald, D.A. (Oak Ridge National Lab., TN (United States)); Oezguener, U. Oak Ridge National Lab., TN (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 12. International Federation of Automatic Control (IFAC) world congress; Sydney (Australia); 19-23 Jul 1993. Order Number DE93012963. Source: OSTI; NTIS; GPO Dep.

In this paper, we present a decentralized strategy for optimal control of interconnected systems exhibiting parametric uncertainty. First, we demonstrate that sensitivity models for linear interconnected systems can be generated at each subsystem using only locally available information. Second, we present an optimal control law that incorporates sensitivity functions in the feedback path. The control scheme is completely decentralized and is proposed as a means of making the closed loop system less sensitive to parameter deviations. Finally, we give an example of an interconnected system and show how this control strategy is implemented.

28135 (CONF-9308124–1) **Eye-gaze and intent: Application in 3D interface control.** Schryver, J.C. (Oak Ridge National Lab., TN (United States)); Goldberg, J.H. Oak Ridge National Lab., TN (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 5. international conference on human-computer interaction; Orlando, FL (United States); 8-13 Aug 1993. Order Number DE93015210. Source: OSTI; NTIS; GPO Dep.

Computer interface control is typically accomplished with an input "device" such as keyboard, mouse, trackball, etc. An input device translates a users input actions, such as mouse clicks and key presses, into appropriate computer commands. To control the interface, the user must first convert intent into the syntax of the input device. A more natural means of computer control is possible when the computer can directly infer user intent, without need of intervening input devices. We describe an application of eye-gaze-contingent control of an interactive three-dimensional (3D) user interface. A salient feature of the user interface is natural input, with a heightened impression of controlling the computer directly by the mind. With this interface, input of rotation and translation are intuitive, whereas other abstract features, such as zoom, are more problematic to match with user intent. This paper describes successes with implementation to date, and ongoing efforts to develop a more sophisticated intent inferencing methodology.

28136 (CRN–92-22) **Multi-dimensional analysis of high resolution γ-ray data.** Flibotte, S. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires); Huettmeier, U.J.; France, G. de; Haas B.; Romain, P.; Theisen, Ch.; Vivien, J.P.; Zen, J. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. [1992]. [17p.] Order Number DE93631732. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nuclear Instruments and Methods in Physics Research, A (NL).

A new generation of high resolution γ-ray spectrometers capable of recording high-fold coincidence events with a large efficiency will soon be available. Algorithms are developed to analyze high-fold γ-ray coincidences. As a contribution to the software development associated with the EUROGAM spectrometer, the performances of computer codes designed to select multi-dimensional gates from 3-, 4- and 5-fold coincidence databases were tested. The tests were performed on events generated with a Monte Carlo simulation and also on real experimental triple data recorded with the 8π spectrometer and with a preliminary version of the EUROGAM array. (R.P.) 14 refs.; 3 figs.; 3 tabs.

28137 (DOE/ER–0587) **Requirements for supercomputing in energy research: The transition to massively parallel computing.** USDOE Office of Energy Research, Washington, DC (United States). Office of Scientific Computing. Feb 1993. 73p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012376. Source: OSTI; NTIS; GPO Dep.

This report discusses: The emergence of a practical path to TeraFlop computing and beyond; requirements of energy research programs at DOE; implementation: supercomputer production computing environment on massively parallel computers; and implementation: user transition to massively parallel computing.

28138 (DOE/ER/25015–T1) **Computation and graphics in mathematical research: Progress report, September 15, 1992–September 15, 1993.** Hoffman, D.A.; Spruck, J. Massachusetts

Univ., Amherst, MA (United States). Jun 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER25015. Order Number DE93016512. Source: OSTI; NTIS; GPO Dep.

Current research is described on: grain boundaries and dislocations in compound polymers, boundary value problems for hypersurfaces constant Gaussian curvature, and discrete computational geometry. 19 refs, 4 figs.

28139 (DOE/ER/25133–1) **Database computing for the SSC: Progress report.** Grossman, R. Illinois Univ., Chicago, IL (United States). Jun 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER25133. Order Number DE93017317. Source: OSTI; NTIS; GPO Dep.

This is a progress report for the Grant "The PASS Project: Database computing for the SSC" for the period September 1, 1993–May 30, 1993. The number of the grant is ER25133; the institution is the University of Illinois at Chicago; and the principal investigator is Robert Grossman. The PASS Project is ware tools for making numerically intensive queries on very large amounts of data, especially high energy physics data. Approach is to view the analysis of such data as an appropriate query on a persistent object store.

28140 (DOE/ER/40374–70) **An optimized formulation for Deprit-type Lie transformations of Taylor maps for symplectic systems.** Shi, Jicong (Houston Univ., TX (United States). Dept. of Physics); Yan, Yiton T. Houston Univ., TX (United States). Dept. of Physics; Superconducting Super Collider Lab., Dallas, TX (United States). [1993]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER40374 ;AC35-89ER40486. (CONF-930511–95: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014886. Source: OSTI; NTIS; INIS; GPO Dep.

An optimized iterative formulation is presented for directly transforming a Taylor map of a symplectic system into a Deprit-type Lie transformation, which is a composition of a linear transfer matrix and a single Lie transformation, to an arbitrary order.

28141 (DOE/ER/61034–2) **Chaos and microbial systems: Final project report, July 1989–July 1992.** Kot, M. Washington Univ., Seattle, WA (United States). Dept. of Applied Mathematics. Oct 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER61034. Order Number DE93016814. Source: OSTI; NTIS; GPO Dep.

The field of nonlinear dynamics has generated a variety of new techniques for identifying order in seemingly chaotic systems. These techniques have led to new insights for several ecological and epidemiological systems, most notably childhood disease epidemics. To better test the efficacy and relevance of these new techniques to population biology research with two components namely a mathematical analysis of some simple microbial models with chaotic dynamics; and experimental (chemostat) population studies to evaluate the accuracy of these models. I have completed a thorough analysis of the forced double-Monod model and of the phase-locking route to chaos that it exhibits. I have also analyzed a simpler pulsed system with mass action kinetics and a period-doubling route to chaos. This research also motivated detailed analyses of discrete-time predator-prey and dispersal models, and a fast new method for computing fractal dimension. My colleagues and I have assembled a complete laboratory system to determine the appropriateness of the forced double-Monod model. We have tested assays for concentration and density and have performed a variety of diagnostic tests on this system. We have measured growth parameters for bacteria and for protozoa in chemostat.

28142 (ENEA-RT-ENERG–91-06) **Mathematical operators: Solutions for four different problems.** Lorenzoni, G. ENEA, Casaccia (Italy). Area Energetica. Dec 1991. 30p. (In Italian). (RT/ENERG–91-06). Order Number DE93799277. Source: OSTI; NTIS (US Sales Only); INIS.

A random numbers generator, based on a new theory, is described. Perfect casuality and absolute assurance against repetitivity for any generation length are the main features of this generator. The generator was used to develop: a new FORTRAN program for text cryptation; a new solution of a combinatorial problem; and a FORTRAN program for linear optimization, using a simplex method, of general applicability and easy implementation.

28143 (ENEA-RT-GEN–91-01) **Project evaluation and monitoring system (SVEN): Multi-criteria algorithm.** Bellacicco, A.; Poma, C.; Vignola, P. ENEA, Rome (Italy). Dec 1991. 33p. (In Italian). (RT/GEN–91-01). Order Number DE93799295. Source: OSTI; NTIS (US Sales Only); INIS.

In this report a new approach to project evaluation, belonging to the wide class of multi-criteria (socio-economic and environmental aspects) preference modelling, is presented. The novelty of the proposal is the introduction of the concepts of targets and benefits and the dynamic use of the algorithm. In this way, the proposed methodology is able to support the project manager in the evaluation of the project 'ex ante', on going, and ex post. The notion of project is new in the operational research context. The target of the proposed notion is different from the usual targets based on the optimization of some given objective functions.

28144 (ENEA-RT-INN–92-24) **Stabilizing periodic orbits in chaotic neural dynamics.** Tondinelli, L. ENEA, Casaccia (Italy). Dec 1992. 23p. (RT/INN–92-24). Order Number DE93799196. Source: OSTI; NTIS (US Sales Only).

Chaotic behavior occurs normally in biological systems, and the appearance of chaos in mathematical simulations must be considered significant. Chaotic states of neuron activity are associated with higher level cognitive processes such as generalization and abstraction. The generalization procedure performed by chaotic attractors is represented by storing a topological image of the whole class of different dynamical behaviors (from different initial conditions) which possess different metrical characteristics but have the same topological invariants. Given a chaotic attractor, information is contained in topological invariants, as, e.g., in closures of the set of its unstable periodic orbits. A method for the stabilization of a selected periodic orbit is the small periodic variation of a system parameter, which can be obtained via the coupling of two physical levels: synaptical transmission and oscillating chemical reactions.

28145 (ENEA-RT-INN–92-25) **There is future for present generation of artificial neural networks.** Tondinelli, L. ENEA, Casaccia (Italy). Area Nucleare. Dec 1992. 20p. (RT/INN–92-25). Order Number DE93799220. Source: OSTI; NTIS (US Sales Only).

This paper suggests reasons to explain why there isn't any future for the present generation of Artificial Neural Networks (ANN's). ANN's have a long history, starting from the mythical paper of McCulloch & Pitts in 1943. Until now, only little has changed in the substance of ANN modeling. They consist of a set of active elements, topologically connected by a matrix of weighted links. The weights variation is the equivalent of 'learning', and the memory is distributed on the entire set of weights. The main property generally used is the capability of an ANN to construct, in its state space, a set of basins of attraction, each corresponding to a learned pattern. Starting from an initial point in the basin, the ANN dynamics falls in the corresponding attractor. The same model has been also used for the simulation of some aspects of neurophysiological experiments; but it is precisely in this field that suspect is born concerning the usefulness and adequacy of such a paradigm. The definition of an ANN architecture for a specific problem is not unique and often requires considerable skill and (why not?) serendipity. Normally, existing literature refers to zero-dimensional ANN's, considering only the topological aspect of the connection matrix, where the incoming information is stored statically (connection weights) in a distributed manner. Evidence is mounting that living neurons possess further properties than a simple binary decision device (stochasticity, temporality, non-linearity, three-dimensionality) which can be included in artificial neurons.

28146 (ESTSC–000154CYYMP02) **KIVA2 92: 2d & 3d Reactive Flows With Fuel Sprays.** Amsden, A.A. (Los Alamos National Lab., NM (United States)); O'Rourke, P.J.; Butler, T.D. Los Alamos National Lab., NM (United States). 27 Mar 1992. Sponsored by USDOE, Washington, DC (United States). Source: ESTSC.

Description: CRAY Y-MP; CTSS and UNICOS; FORTRAN 77; 1 3.5 Diskette. KIVA2 92 uses Cray vectorization statements. Several SLATEC3.1 and LINPACK routines are called. These routines are

provided. KIVA2 92 also calls some CTSS system routines and LANL-specific graphics routines. These routines are not provided but are described at the end of the FORTRAN source. This version corrects errors found in the earlier version, has enhanced portability, more robustness, better accuracy, greater speed, added fuels and corrected/expanded descriptions.

KIVA2 92 solves the equations of transient, two and three-dimensional, chemically reactive fluid flow with sprays. The KIVA2 92 equations and numerical solution procedure are very general and can be applied to laminar or turbulent flows, subsonic or supersonic flows, and single-phase or dispersed two-phase flows. Arbitrary numbers of chemical species and reactions are allowed. A stochastic particle method is used to calculate evaporating liquid sprays, including the effects of droplet collisions and aerodynamic breakups. Although the initial and boundary conditions and mesh generation were written for internal combustion energy calculations, the logic for these specifications can be easily modified for a variety of other applications.

28147 (ESTSC–000154CYYMP03) **KIVA3: A KIVA Program With Block-Structured Mesh for Complex Geometries.** Amsden, A.A. (Los Alamos National Lab., NM (United States)). Los Alamos National Lab., NM (United States). 1 Mar 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Source: ESTSC.

Description: CRAY Y-MP; UNICOS VERSION 6.1.6; Cray Fortran 77 VERSION 5.0.4.12; 1 3.5 Diskette. Source code requires UPDATE to generate a compile file. Linear system solver, such as in LINPACK, is required for equilibrium chemistry solver. Several calls are made to run-time libraries. Graphics postprocessor requires primitives for point plotting and vector drawing, along with character string conversion for plot labels. Source was compiled on a CRAY Y-MP8/864.

KIVA3 is a computer program for the numerical calculation of transient, two and three-dimensional, chemically reactive flows with sprays. It is an extension of the earlier KIVA2, and uses the same numerical solution procedure and solves the same set of equations. KIVA3 differs in that it uses a block-structured mesh with connectivity defined through indirect addressing. The departure from a single rectangular structure in logical space allows complex geometries to be modeled with significantly greater efficiency because large regions of deactivated cells are no longer necessary. Cell-face boundary conditions permit greater flexibility and simplification in the application of boundary conditions.

28148 (ESTSC–000171IPCAT02) **ADASAGE4.02-ALYSIS: Ada Application Development System.** Stewart, K. (EG and G Idaho Inc., Idaho Falls, ID (United States)); Russell, K. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1 Jul 1992. Sponsored by USDOE, Washington, DC (United States); Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Department of Defense, Washington, DC (United States). Source: ESTSC.

Description: IBM PC/AT; DOS; ADA; 13 3.5 Diskettes. The Alsys Ada 4.33 compiler is required.

ADASAGE is an application development system designed to facilitate rapid and professional construction of applications written in Ada on microcomputers. Applications may vary in size from small to large multiprogram systems. ADASAGE consists of a collection of re-usable libraries for database management and form and report processing utilities having the following capabilities: basic universal type and function definitions; sequential file input/output; terminal and file input/output; DOS system command execution; data movement and fill; string manipulation; math libraries; bit manipulation; a relational database utility; data validation; menu form and window procedures; report generation; sort/merge, time, and date functions; sound production; editing; and index rebuilding. These capabilities are integrated to allow the development of an efficient system. As an application is designed and developed, ADASAGE capabilities are selected and included along with any requirements unique to that application.

28149 (ESTSC–000171IPCAT03) **ADASAGE4.02-MERIDIAN: Ada Application Development System.** Stewart, K. (EG and G Idaho, Idaho Falls, ID (United States)); Russell, K. EG and G Idaho, Inc., Idaho Falls, ID (United States). 10 Jul 1992. Sponsored by USDOE, Washington, DC (United States); Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Department of Defense, Washington, DC (United States). Source: ESTSC.

Description: IBM PC/AT; DOS; ADA; 10 3.5 Diskettes. The ADASAGE reference documents are written in ARC format and, when extracted, must be printed with WORDPERFECT.

ADASAGE is an application development system designed to facilitate rapid and professional construction of applications written in Ada on microcomputers. Applications may vary in size from small to large multiprogram systems. ADASAGE consists of a collection of re-usable libraries for database management and form and report processing utilities having the following capabilities: basic universal type and function definitions; sequential file input/output; terminal and file input/output; DOS system command execution; data movement and fill; string manipulation; math libraries; bit manipulation; a relational database utility; data validation; menu form and window procedures; report generation; sort/merge, time, and date functions; sound production; editing; and index rebuilding. 28150 (ESTSC–000337I036000) **PDQ7: 1,2 or 3-d few-gp diffusion depletion.** Wagner, R.J. (EG and G Idaho, Idaho Falls, ID (United States)); Brown, A.W. Bettis Atomic Power Lab., Pittsburgh, PA (United States). 1 Dec 1982. Sponsored by USDOE, Washington, DC (United States). (NESC–275). Source: ESTSC.

Description: IBM360; OS/MVT (IBM360); OS/MVS (IBM30xxFORTRAN IV and COMPASS; 1 Mag Tape.

The PDQ series of programs is designed to solve the neutron diffusion-depletion problem in one, two or three dimensions. The three-dimensional spatial calculation may be either explicit or discontinuous trial function synthesis. Up to five lethargy groups are permitted. Adjoint, fixed source, one iteration, additive fixed source, eigenvalue, and boundary value calculations may be performed. The programs utilize the HARMONY system for time-dependent representation of cross section variation and generalized depletion chain solutions. Geometries available include rectangular, cylindrical, spherical, and hexagonal. All allow variable mesh in all dimensions. Various control searches as well as temperature and xenon feedback are provided.

28151 (ESTSC–000515I036000) **PHROG: Multi-gp Constant & Fast Spectra Calc.** Curtis, R.L. (EG and G Idaho Inc., Idaho Falls, ID (United States)); Singer, G.L.; Wheeler, F.J.; Grimesey, R.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1 Dec 1971. Sponsored by USDOE, Washington, DC (United States). (NESC–520). Source: RADIATION SHIELDING INFORMATION CENTER.

Description: IBM360; OS/360; FORTRAN IV; 1 Mag Tape.

PHROG generates energy dependent fast neutron spectra and associated multigroup cross section data suitable for use in diffusion and transport theory reactor design analysis. The solution utilizes 68 equal lethargy groups of cross section, source, and leakage data over an energy range extending from 10 MeV to 0.414 eV. These data are then coalesced into broad group form using the fluxes and currents as weighting functions.

28152 (ESTSC–000574IBMPC00) **RISKIND: Radiological Risk Assessment Code for Spent Nuclear Fuel Transportation.** Chen, S.Y. (Argonne National Lab., IL (United States)); LePoire, D.J.; Yuan, Y.C.; Rothman, R. Argonne National Lab., IL (United States). 1 Feb 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Source: ESTSC; As is due to no source code being provided.

Description: IBM PC; DOS; Lahey FORTRAN (70%) Microsoft BASIC (30%); 1 3.5 Diskette. Input data files *.INP, output data files *.OUT, installation batch file INSTALL.BAT, database files *.DAT. DUE TO NO SOURCE CODE RELEASED AS-IS.

RISKIND is a computer code system for calculating the radiological consequences and health risks to individuals from the transportation of spent nuclear fuel.

28153 (ESTSC–000587IBMPC00) **BARS/SSC/SPHINX: BARS Bibliographic Data Retrieval System.** Herrmann, W. (Sandia National Labs., Albuquerque, NM (United States)). Sandia National Labs., Albuquerque, NM (United States). 6 Jun 1993. Sponsored by USDOE, Washington, DC (United States). Source: ESTSC.

Description: IBM PC; DOS version 2.2. or higher.; askSam; 2 5.25 Diskettes. Data files must carry the extension .ASK. BARS requires the use of the askSam database program, of which a read-only runtime version is included under license from askSam Systems, SeaSide Software, Inc. PO Box 1428, Perry FL, 32347 USA. Distribution is via self-extracting files compressed using PKARC under license from PKWARE Inc, 7545 North Port Washington Rd., Glendale WI, 53217, USA. DOES NOT CONTAIN SOURCE CODE.

BARS is a program which allows retrieval of information from suitable bibliographic databases. Two databases are included, SSC and SPHINX, which together list bibliographic information for some 12,000 references related to the fields of shoch compression of condensed media, high rate deformation of solids, and detonation.

28154 (ESTSC–000588C017600) **GSM: Columbia Plateau Geologic Site Simulation.** Golis, M.J. (Battelle Columbus Division, OH (United States)). Battelle, Columbus, OH (United States). 1 Jun 1984. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10140. (NESC–9845). Source: ESTSC.

Description: CDC CYBER176; NOS 1.4 (CDC CYBER176); NOS 2.5.ANSI FORTRAN X3.9-1978; 1 Mag Tape.

GSM is a Monte Carlo simulation program for tracking the future evolution of a repository site over periods of up to several million years. Phenomena included in the model that potentially can affect the site over such periods are: climatic changes, glaciation, deformation, geomorphic events, magmatic events, meteorite impact, sea-level fluctuations, shaft seal failure, basement faulting, and undetected features. Interrelationships among phenomena are modeled, and the effects of changes on ground-water flow are followed using a simplified network model of the ground-water system in a two-dimensional cross-section of the study area. The model is specific to a potential repository site in the Pasco Basin area of the Columbia Plateau. The ground water portion of the code is two-dimensional and is based on a specific conceptualization of the hydrology in the region surrounding the Pasco Basin. The probabilistic nature of the model enables it to be used to evaluate whether a potential site meets any probabilistic regulatory standards such as those that have been issued by the Environmental Protection Agency. Two auxiliary interactive programs to process input and output, respectively, are included. The Input Module is executed prior to the simulation to 1) generate a set of unformatted data files for first-time simulation access; 2) change any or all input parameter values from the previous simulation; or 3) generate listings of input parameter values. The Output Module is used to examine the three unformatted files (SUMMARY, HISTORY, and MASTER) produced by GSM. In addition, an auxiliary conversion routine is included to convert the formatted climate data to binary records for use by the Far Field State Model (FFSM) program.

28155 (ESTSC–000589C017600) **SALT4: Bedded Salt Radioactive Waste Storage.** Golis, M.J. (Batelle Columbus Division, OH (United States)). Battelle, Columbus, OH (United States). 1 Apr 1983. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10140. (NESC–9849). Source: ESTSC.

Description: CDC CYBER176; NOS 1.4 (CDC CYBER176); NOS2.5.1FORTRAN IV; 1 Mag Tape.

SALT4 is a two-dimensional, analytical displacement discontinuity code designed to evaluate temperatures, deformation, and stresses associated with underground disposal of radioactive waste in bedded salt. SALT4 takes into account viscoelastic behavior in the pillars adjacent to excavations, transversely isotropic elastic moduli such as those exhibited by bedded or stratified rock, and excavation sequence. SALT4 can be used for parameter sensitivity analyses of two-dimensional, repository-scale, thermal and thermomechanical response in bedded salt during the excavation, operational, and post-closure phases. It is especially useful in evaluating alternative patterns and sequences of excavation or waste canister placement. Although SALT4 was designed for analysis of bedded salt, it is also applicable to crystalline rock if the creep calculation is suppressed. The main disadvantage of SALT4 is that some of the assumptions made, i.e. temperature independent material properties, render it unsuitable for canister-scale analysis or analysis of lateral deformation of the pillars. The SALT4 model can serve as a valuable auxiliary to the more sophisticated SCEPTER finite-element and finite-difference thermal and thermomechanical codes by helping to resolve issues which arise from the finite calculational domain inherent in the latter approaches. The finite-element and finite-difference codes may require a very large number of nodes to circumvent effects of the finite domain inherent in their application. Because of the nature of the influence functions used in the SALT4 formulation, it models a semi-infinite domain and is therefore not subject to this limitation.

28156 (ESTSC–000590C017000) **ICOP: Financial Model Industrial Cogeneration.** Green, L.M. (TRW, McLean, VA (United States)); Burnworth, H.F. TRW Energy Development Group, McLean, VA (United States). 1 Mar 1982. Sponsored by USDOE, Washington, DC (United States). (NESC–971). Source: ESTSC.

Description: CDC CYBER170; MACE; the TRW-modified KRONOS OpFORTRAN IV; 1 Mag Tape. ICOP is adaptable to other computer systems with minor modifications.

The ICOP program performs financial analysis computations in a generic fashion, with special emphasis on the analysis of industrial cogeneration applications. Both undiscounted and discounted cash flows are generated. Measures of financial feasibility include energy savings, internal rate of return, and net present value.

28157 (ESTSC–000592C760000) **WHAM6: Liquid-Filled Piping System Analysis.** Edwards, H. (Argonne National Lab., IL (United States)). Argonne National Lab., IL (United States). 1 Jul 1977. Sponsored by USDOE, Washington, DC (United States). (NESC–278). Source: ESTSC.

Description: CDC7600; SCOPE 2.1.3; FORTRAN IV; 1 Mag Tape.

WHAM6 is used to calculate pressure and velocity transients in liquid-filled piping networks. It can be applied to multiloop complex piping networks consisting of dead ends, elbows, orifices, multiple-branch tees, changes of flow passage cross section, check valves, pumps, pressurizers or tanks, and exit valves or breaks. Hydraulic losses are considered. Transients can be initiated either by closure or opening of one or more exit valves (equivalent to system ruptures) or by a prescribed gas pressure history in a pressurizer tank.

28158 (ESTSC/NRC–000119IBMPC00) **TRAC-PF1: Best-Estimate Analysis PWR LOCA.** Borges, R. (Comissao Nacional de Energia Nuclear (CNEN), Rio de Janeiro, RJ (Brazil)). Comissao Nacional de Energia Nuclear (CNEN), Rio de Janeiro, RJ (Brazil). 1 Feb 1984. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research. (NESC–836). Source: ESTSC.

Description: IBM PC; DOS 3.2 or later; SVS FORTRAN 77; 4 5.25 Diskettes. COMPASS replacement routines for the TRAC-PF1 linear equation solver are included in the CDC package for more efficient operation. For plotting, TRAP, the CDC version graphics program, makes use of the Integrated Software Systems Corporation's (ISSCO) proprietary software product DISSPLA. The conversion from the CDC to IBM environment was done at Gesellschaft fuer Reaktorsicherheit, West Germany, using an Amdahl 470 V/6 II with IBM MVS operating system and the FORTRAN H Extended Enhanced compiler. THIS PACKAGE IS WRITTEN TO USE A DEFINICON 780+ OR 785 MATH COPROCESSOR BOARD. NO SOURCE CODE IS AVAILABLE FOR THIS PACKAGE. THIS PACKAGE COULD NOT BE TESTED BY THE ESTSC.

TRAC-PF1 performs best-estimate analyses of loss of coolant accidents and other transients in pressurized light water reactors. The program can also be used to model a wide range of thermal hydraulic experiments in reduced-scale facilities. Models employed include reflood, multi-dimensional two-phase flow, nonequilibrium thermodynamics, generalized heat transfer, and reactor kinetics. Automatic steady-state and dump/restart capabilities are provided. The changes reported in TRACNEWS issues through Number 7 are incorporated in this release.

28159 (ESTSC/NRC–000579IBMPC00) **REMIT3.0: Radiation Exposure Monitoring and Information Transmittal System.** Dixson, P. (Science Applications International Corp., Oak Ridge, TN (United States)); Clark, T.; Cale, R. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research. 1 Apr 1993. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research. Source: ESTSC.

Description: IBM PC; DOS; dBASE III; 2 3.5 Diskettes. For 286 computers, the system must have at least 2 megabyte LIM 4.0 compatible expanded memory. For 386 (or higher) computers, the system requires at least 2 megabytes extended memory available and no expanded memory. If expanded memory is present, REMIT will attempt to make use of it instead of the extended memory. Since REMIT uses extended memory much more efficiently than expanded memory on a 386 machine, all references to expanded memory in your CONFIG.SYS file should be removed in order for REMIT to make use of your extended memory. See your DOS manual for information about modifying your CONFIG.SYS file and memory management. The memory management has been designed to meet the minimum system requirements while making use of more advanced features...

The Radiation Exposure Monitoring and Information Transmittal (REMIT) system is designed to assist U.S. Nuclear Regulatory Commission (NRC) licensees in meeting the reporting requirements of the Revised 10 CFR Part 20 and in agreement with the guidance contained in Regulatory Guide 8.7, Rev.1, Instructions for Recording and Reporting Occupational Exposure Data. REMIT is a personal computer (PC)-based menu driven system that facilitates the manipulation of data base files to record and report radiation exposure information. REMIT is designed to be user-friendly and contains the full text of Regulatory Guide 8.7, Rev.1, on-line as well as context-sensitive help throughout the program. The user can enter data directly from NRC Form 5s or Form 4s. REMIT allows the user to view the individual's exposure in relation to regulatory or administrative limits and will alert the user to exposures in excess of these limits. The system also provides for the calculation and summation of dose from intakes and the determination of the dose to the maximally exposed extremity for the monitoring year. REMIT can produce NRC Form 5s and 4s in paper and electronic format and can import/export data from ASCII and data base files.

28160 (ESTSC/NRC/R–000364IBMPC01) **SARA4.15: System Analysis and Risk Assessment System.** Russell, K. (EG and G Idaho Inc., Idaho Falls, ID (United States)). EG and G Idaho, Inc., Idaho Falls, ID (United States). 1 Nov 1992. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research. Source: ESTSC.

Description: IBM PC; IBM Microsoft DOS Version 3.3; MODULA-2; 2 5.25 Diskettes. This software uses the Media Cybernetics HALO graphical support routines. The run time files are included with the software and can be distributed with this software as a license has been acquired. Since no source was provided, only the executable was tested. Also, since no sample problems were provided, testing was very limited.

SARA4.15 is a program that allows the user to review the results of a Probabilistic Risk Assessment (PRA) and to perform limited sensitivity analysis on these results. This tool is intended to be used by a less technical oriented user and does not require the level of understanding of PRA concepts required by a full PRA analysis tool. With this program a user can review the information generated by a PRA analyst and compare the results to those generated by making limited modifications to the data in the PRA. Also included in this program is the ability to graphical display the information stored in the database. This information includes event trees, fault trees, P&IDs and uncertainty distributions.

28161 (ESTSC/NRC/R–000572IBMPC00) **EDSFI: Electrical Distribution System Functional Inspection Data Base.** Bittle, D. (Applied Management Systems, Washington, DC (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Reactor Inspection and Safeguards. 1 Jan 1993. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Reactor Regulation. Source: ESTSC.

Description: IBM PC; DOS 5.0; FORTRAN; 2 3.5 Diskettes. The EDSFI findings include observations, unresolved issues, or possible deficiencies in the design and implementation of electrical distribution systems in nuclear plants. The findings in the EDSFI database are assigned primary, secondary, and tertiary fields. Each of the five primary fields has a wide scope and includes a summary of EDS problems in that area within the industry. DUE TO THE LACK OF SOURCE CODE AND SAMPLE PROBLEMS, ESTSC RELEASES THIS PACKAGE AS-IS.

This database contains inspection findings from the Nuclear Regulatory Commission's Electrical Distribution System Functional Inspections (EDSFIs). The program enables the user to search and sort findings, ascertain trends, and obtain printed reports of the findings. The findings include observations, unresolved issues, or possible deficiencies in the design and implementation of electrical distribution systems in nuclear plants. This database will assist those preparing for electrical inspections, searching for deficiencies in a plant, and determining the corrective actions previously taken for similar deficiencies. This database will be updated as new EDSFIs are completed.

28162 (IC–93/73) **A strongly nonlinear reaction diffusion model for a deterministic diffusive epidemic.** Kirane, M. (International Centre for Theoretical Physics, Trieste (Italy)); Kouachi, S. International Centre for Theoretical Physics, Trieste (Italy). Apr 1993. [8p.] Order Number DE93628569. Source: OSTI; NTIS (US Sales Only); INIS.

In the present paper the mathematical validity of a model on the spread of an infectious disease is proved. This model was proposed by Bailey. The mathematical validity is proved by means of a positivity, uniqueness and existence theorem. Moreover the large time behaviour of the global solutions is analyzed. In spite of the apparent simplicity of the problem, the solution requires a delicate set of techniques. It seems very difficult to extend these techniques to a model in more than one dimension without imposing conditions on the data. (author). 9 refs.

28163 (IC–93/92) **Stability analysis for an age-dependent vaccination model.** El-Doma, M. International Centre for Theoretical Physics, Trieste (Italy). May 1993. [12p.] Order Number DE93628570. Source: OSTI; NTIS (US Sales Only); INIS.

The stability of an SIR epidemic model with vaccination is investigated. We determine the steady states and examine their stability. Furthermore, a critical vaccination coverage that will eventually eradicate the disease is determined. (author). 9 refs.

28164 (INIS-mf–12758, pp. 89-92) **Post-processing of the TRAC code's results.** Baron, J.H. (Comision Nacional de Energia Atomica, San Carlos de Bariloche (Argentina). Centro Atomico Bariloche); Neuman, D. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The TRAC code serves for the analysis of accidents in nuclear installations from the thermohydraulic point of view. A program has been developed with the aim of processing the information rapidly generated by the code, with screening graph capacity, both in high and low resolution, or either in paper through printer or plotter. Although the programs are intended to be used after the TRAC runs, they may be also used even when the program is running so as to observe the calculation process. The advantages of employing this type of tool, its actual capacity and its possibilities of expansion according to the user's needs are herein described. (Author).

28165 (JINR-R–11-92-100) **ASYS: a computer algebra package for analysis of nonlinear algebraic equations systems.** Gerdt, V.P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation); Khutornoj, N.V.; Zharkov, A.Yu. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1992. [19p.] (In Russian). Order Number DE93629819. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Programmirovanie.

A program package ASYS for analysis of nonlinear algebraic equations based on the Groebner basis technique is described. The package is written in REDUCE computer algebra language. It has special facilities to treat polynomial ideals of positive dimension, corresponding to algebraic systems with infinitely many solutions. Such systems can be transformed to an equivalent set of subsystems with reduced number of variables in completely automatic way. It often allows to construct the explicit form of a solution set in many problems of practical importance. Some examples and results of comparison with the standard Reduce package GROEBNER and special-purpose systems FELIX and A1PI are given. 21 refs.; 2 tabs.

28166 (K/DSRD/FTR–150) **Standards on computers in document processing and related communication: Foreign trip report, November 13–23, 1992.** Snyder, C.E. Oak Ridge K-25 Site, TN (United States). 4 Dec 1992. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OT21400. Order Number DE93009135. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler participates in the International Organization for Standardization (ISO) work on computers in Document Processing and Related Communication. The November, 1992, meeting of Working Group 9 (WG9) considered international comments on draft standards for keyboards, cursor control, icons, and names of objects and actions. A document placing the Q on the 7 and the Z on the 9 of the telephone-style keypad was recommended for Draft International Standard processing. A working paper summarizing options for conformance to the icon standard was produced. User requirements were produced for icons and objects and action standardization. In addition, a first working draft for a voice messaging standard was produced.

28167 (LA-UR–93-1181) **Addressing the insider threat.** Hochberg, J.G.; Jackson, K.A.; McClary, J.F.; Simmonds, D.D. Los Alamos National Lab., NM (United States). [1993]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9305151–3: 15. computer security group training conference: mission possible - connected and protected, Albuquerque, NM (United States), 3-6 May 1993). Order Number DE93012626. Source: OSTI; NTIS; GPO Dep.

Computers have come to play a major role in the processing of information vital to our national security. As we grow more dependent on computers, we also become more vulnerable to their misuse. Misuse may be accidental, or may occur deliberately for purposes of personal gain, espionage, terrorism, or revenge. While it is difficult to obtain exact statistics on computer misuse, clearly it is growing. It is also clear that insiders – authorized system users – are responsible for most of this increase. Unfortunately, their insider status gives them a greater potential for harm This paper takes an asset-based approach to the insider threat. We begin by characterizing the insider and the threat posed by variously motivated insiders. Next, we characterize the asset of concern: computerized information of strategic or economic value. We discuss four general ways in which computerized information is vulnerable to adversary action by the insider: disclosure, violation of integrity, denial of service, and unauthorized use of resources. We then look at three general remedies for these vulnerabilities. The first is formality of operations, such as training, personnel screening, and configuration management. The second is the institution of automated safeguards, such as single-use passwords, encryption, and biometric devices. The third is the development of automated systems that collect and analyze system and user data to look for signs of misuse.

28168 (LA-UR–93-1287) **A network evaluation and analysis tool.** Stoltz, L.A.; Whiteson, R.; Fasel, P.K.; Temple, R.; Dreicer, J.S. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930773–2: 9. international conference on systems engineering (ICSE '93), Las Vegas, NV (United States), 14-16 Jul 1993). Order Number DE93012647. Source: OSTI; NTIS; GPO Dep.

The rapid emergence of large heterogeneous networks, distributed systems, and massively parallel computers has resulted in economies of scale, enhanced productivity, efficient communication, resource sharing, and increased reliability, which are computationally beneficial. In addition to these benefits, networking presents technical challenges and problems with respect to maintaining and ensuring the security, design, compatibility, integrity, functionality, and management of these systems. In this paper we describe a computer security tool, Network Evaluation and Analysis Tool (NEAT), that we have developed to address these concerns.

28169 (LA-UR–93-1565) **Identification of continuous-time dynamical systems: Neural network based algorithms and parallel implementation.** Farber, R.M. (Los Alamos National Lab., NM (United States)); Lapedes, A.S.; Rico-Martinez, R.; Kevrekidis, I.G. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930331–11: 6. Society for Industrial and Applied Mathematics (SIAM) conference on parallel processing for scientific computing, Norfolk, VA (United States), 21-24 Mar 1993). Order Number DE93014427. Source: OSTI; NTIS; GPO Dep.

Time-delay mappings constructed using neural networks have proven successful performing nonlinear system identification; however, because of their discrete nature, their use in bifurcation analysis of continuous-tune systems is limited. This shortcoming can be avoided by embedding the neural networks in a training algorithm that mimics a numerical integrator. Both explicit and implicit integrators can be used. The former case is based on repeated evaluations of the network in a feedforward implementation; the latter relies on a recurrent network implementation. Here the algorithms and their implementation on parallel machines (SIMD and MIMD architectures) are discussed.

28170 (LA-UR–93-1569) **Thermodynamics of computation and information distance.** Bennett, C.H.; Gacs, P.; Li, M.; Vitanyi, P.M.B.; Zurek, W.H. Los Alamos National Lab., NM (United States). 12 Mar 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9306155–1: Symposium on theory of computation (STOC), San Diego, CA (United States), 7-11 Jun 1993). Order Number DE93012730. Source: OSTI; NTIS; GPO Dep.

Applying the tools of algorithmic information theory, we compare several candidates for an asymptotically machine-independent. absolute measure of the informational or "cognitive" distance between discrete objects x and y. The maximum of the conditional Kolmogorov complexities max{K(y|z) K(m|y)}, is shown to be optimal, in the sense of being minimal within an additive constant among semicomputable, symmetric, positive semidefinite functions of z and y satisfying a reasonable normalization condition and obeying the triangle intequality. The optimal metric, in turn, differs by at most an additive logarithmic term from the size of the smallest program for a universal reversible computer to transform x into y. This program functions in a 'catalytic" capacity, being retained in the computer before, during, and after the computation. Similarly, the sum of the conditional complexities. K(y|x) + K(x|y), is shown to be equal within a logarithmic term to the minimal amount Of information flowing out and in during a reversible computation in which the program is not retained. Finally. using the physical theory of reversible computation, it is shown that the simple difference K(x) - K(y) is an appropriate (ie universal, antisymmetric, and transitive) measure of the amount of thermodynamic work required to transform string x into string y by the most efficient process.

28171 (LA-UR–93-1981) **Efficiency effects of variation in controlled experimental variables.** Wendelbeger, J.R. Los Alamos National Lab., NM (United States). [1993]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9308107–1: American Statistical Association (ASA) conference, San Francisco, CA (United States), 11 Aug 1993). Order Number DE93014345. Source: OSTI; NTIS; GPO Dep.

When a designed experiment is conducted, the exact levels of controlled experimental variables specified by the design may not be attainable. Two different types of situations can occur in which the actual settings of the design variables deviate from the target design settings. In one case, the actual settings obtained are unknown. In the other case, the actual settings are known; however desirable design properties such as orthogonality may have been

lost. This paper examines the impact of known and unknown errors in experimental variables for designed experiments in which the response is assumed to be approximately linear in the region of interest. For comparison, the well known situation where the target values of the experimental variables can actually be obtained will also be considered.

28172 (LA-UR–93-1983) **Adaptive Transfer Function Networks.** Goulding, J.R. (Los Alamos National Lab., NM (United States)). Los Alamos National Lab., NM (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930741–3: World congress on neural networks, Portland, OR (United States), 11-15 Jul 1993). Order Number DE93014344. Source: OSTI; NTIS; GPO Dep.

Real-time pattern classification and time-series forecasting applications continue to drive artificial neural network (ANN) technology. As ANNs increase in complexity, the throughput of digital computer simulations decreases. A novel ANN, the Adaptive Transfer Function Network (ATF-Net), directly addresses the issue of throughput. ATF-Nets are global mapping equations generated by the superposition of ensembles of neurodes having arbitrary continuous functions receiving encoded input data. ATF-Nets may be implemented on parallel digital computers. An example is presented which illustrates a four-fold increase in computational throughput.

28173 (ORNL/TM–12269) **Rare attributes in finite universe: Hypotheses testing specification and exact randomized upper confidence bounds.** Wright, T. Oak Ridge National Lab., TN (United States). Mar 1993. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012783. Source: OSTI; NTIS; GPO Dep.

When attributes are rare and few or none are observed in the selected sample from a finite universe, sampling statisticians are increasingly being challenged to use whatever methods are available to declare with high probability or confidence that the universe is near or completely attribute-free. This is especially true when the attribute is undesirable. Approximations such as those based on normal theory are frequently inadequate with rare attributes. For simple random sampling without replacement, an appropriate probability distribution for statistical inference is the hypergeometric distribution. But even with the hypergeometric distribution, the investigator is limited from making claims of attribute-free with high confidence unless the sample size is quite large using nonrandomized techniques. In the hypergeometric setting with rare attributes, exact randomized tests of hypothesis a,re investigated to determine the effect on power of how one specifies the null hypothesis. In particular, specifying the null hypothesis as zero attributes does not always yield maximum possible power. We also consider the hypothesis specification question under complex sampling designs including stratified random sampling and two-stage cluster sampling (one case involves random selection at first stage and another case involves probability proportional to size without replacement selection at first stage). Also under simple random sampling, this article defines and presents a simple algorithm for the construction of exact "randomized" upper confidence bounds which permit one to possibly report tighter bounds than those exact bounds obtained using "nonrandomized" methods.

28174 (ORNL/TM–12356) **Broadcasting on linear arrays and meshes.** Seidel, S.R. (Michigan Technological Univ., Houghton, MI (United States). Dept. of Computer Science). Oak Ridge National Lab., TN (United States). Mar 1993. 42p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC05-84OR21400. Grant NAG2-757. Order Number DE93013805. Source: OSTI; NTIS; GPO Dep.

The well known spanning binomial tree broadcast algorithm is generalized to obtain several new broadcast algorithms for linear arrays and meshes. These generalizations take advantage of bidirectional communication, the connectivity of two-dimensional meshes, and the difference between node-to-network and network-to-network bandwidth. It is shown how these algorithms can be further generalized so that any node can be the source of the broadcast message. A partitioning scheme is given that allows these algorithms to be used on linear arrays and meshes of any size. One of these algorithms, the bidirectional spanning tree broadcast, always has lower cost than the recursive halving broadcast for linear arrays. All of these algorithms offer significant performance improvements over the basic spanning tree broadcast. These algorithms do not rely on a knowledge of machine dependent constants for network bandwidth and latency, so their performance is not as sensitive to changes in machine characteristics as that of hybrid and pipelined algorithms. Performance measurements are given for some of these broadcast algorithms on the Intel Delta mesh.

28175 (ORNL/TM–12375, pp. 1-11) **Implications in vivid logic.** Akama, Seiki (Teikyo Univ. of Technology, Chiba (JP)); Ohnishi, Hiroto. Oak Ridge National Lab., TN (United States). May 1993. (CONF-9306151–: 7. international symposium on methodologies for intelligent systems, Trondheim (Norway), 15-18 Jun 1993). In *Proceedings of the Seventh International Symposium on Methodologies for Intelligent Systems (Poster Session).* 174p. Order Number DE93013470. Source: OSTI; NTIS.

The authors discuss implications in vivid logic to enhance the expressive power concerning conditional knowledge. This can be accomplished as an extension of Wagner's partial logical framework. It is shown that the resulting system is equivalent to Nelson's constructive logic. The authors also argue inconsistency handling in the proposed framework. 18 refs.

28176 (ORNL/TM–12375, pp. 27-43) **A natural language generation system for a heterogeneous distributed database system.** Desai, B.C. (Concordia Univ., Montreal (CA)). Oak Ridge National Lab., TN (United States). May 1993. (CONF-9306151–: 7. international symposium on methodologies for intelligent systems, Trondheim (Norway), 15-18 Jun 1993). In *Proceedings of the Seventh International Symposium on Methodologies for Intelligent Systems (Poster Session).* 174p. Order Number DE93013470. Source: OSTI; NTIS.

In this paper the authors describe the design issues of a database independent natural language generation system (NLG system) targeted for non-technical users. The NLG system generates output in the form of a coherent, consistent and stylish text. A prototype NLG system which addresses these issues has been built for integration into a multilevel interface for a Heterogeneous Distributed Database Management System. 30 refs., 9 figs.

28177 (ORNL/TM–12375, pp. 55-69) **Strategy acquisition by an artificial neural network: Experiments in learning to play a stochastic game.** Mazur, N.M. (Union College, Schenectady, NY (US)). Oak Ridge National Lab., TN (United States). May 1993. (CONF-9306151–: 7. international symposium on methodologies for intelligent systems, Trondheim (Norway), 15-18 Jun 1993). In *Proceedings of the Seventh International Symposium on Methodologies for Intelligent Systems (Poster Session).* 174p. Order Number DE93013470. Source: OSTI; NTIS.

Artificial neural networks have been successfully used to perform a variety of tasks, mostly in the areas of pattern recognition and classification. This paper explores their use in learning and executing strategies. A series of experiments are performed in which a network using the backpropagation algorithm learns strategies for playing the game of casino blackjack. The experiments range from the supervised learning of a blackjack strategy using the normal backpropagation regime, to supervised learning using situations generated from the naturally occurring probabilities of the game, and, finally, to an unsupervised experiment where the network learns a strategy based on its performance and past experience in playing. The latter experiments introduce probabilistic and contradictory feedback to the network due to the stochastic nature of the game. The experiments show that artificial neural networks can be used to represent and learn strategies for a stochastic game and that their performance can be favorably compared to that of human players. 14 refs., 11 figs., 1 tab.

28178 (ORNL/TM–12375, pp. 70-79) **Viewpoints and selective inheritance in object-oriented modeling.** Oivo, M. (Technical Research Centre of Finland, Oulu (FI)). Oak Ridge National Lab., TN (United States). May 1993. (CONF-9306151–: 7. international symposium on methodologies for intelligent systems, Trondheim

(Norway), 15-18 Jun 1993). In *Proceedings of the Seventh International Symposium on Methodologies for Intelligent Systems (Poster Session)*. 174p. Order Number DE93013470. Source: OSTI; NTIS.

Object-oriented modeling is a powerful and natural knowledge representation mechanism for many real-life applications. However, there are situations when the traditional object-oriented modeling and inheritance lattices are not sufficient. The authors introduce a dynamic viewpoint mechanism with selective inheritance for building models in the context of software engineering and for viewing the models from multiple perspectives. Furthermore, a set of inter-object relationships is described which can be used to enhance the traditional object-oriented and frame-based modeling mechanisms. These methods and techniques have been implemented in a prototype system and they have been used to model various software engineering activities and elements. 21 refs., 3 figs.

28179 (ORNL/TM–12375, pp. 95-109) **Utilization of the case-based reasoning method to resolve dynamic problems.** Rougegrez, S. (Universite Pierre & Marie Curie, Paris (FR)). Oak Ridge National Lab., TN (United States). May 1993. (CONF-9306151–: 7. international symposium on methodologies for intelligent systems, Trondheim (Norway), 15-18 Jun 1993). In *Proceedings of the Seventh International Symposium on Methodologies for Intelligent Systems (Poster Session)*. 174p. Order Number DE93013470. Source: OSTI; NTIS.

Case-based reasoning allows resolution of problems by comparison with already resolved ones. This technique is being utilized for domains in which little knowledge is correctly formalized. A minimum of knowledge has to be available to represent cases stored in memory, called a case base. This knowledge does not always exist, as is shown in this paper. A definition of viewpoints is proposed in which this system of case-based reasoning permits prediction of evolution of problems from a given time. 13 refs., 4 figs.

28180 (ORNL/TM–12375, pp. 80-94) **Multivariate discretization of continuous attributes for machine learning.** Rauber, T.W. (Universidade Nova de Lisboa, Monte deCaparica (PT)); Steiger-Garcao, A.S.; Coltuc, D. Oak Ridge National Lab., TN (United States). May 1993. (CONF-9306151–: 7. international symposium on methodologies for intelligent systems, Trondheim (Norway), 15-18 Jun 1993). In *Proceedings of the Seventh International Symposium on Methodologies for Intelligent Systems (Poster Session)*. 174p. Order Number DE93013470. Source: OSTI; NTIS.

Symbolic Machine teaming algorithms like decision tree or rule induction programs must discretize continuous attributes. This symbolization of continuous values is usually done in an univariate way. That means that the attributes are transformed from continuous to discrete space independently from each other. For each attribute the infinite range of its possible values is discretized to a finite number of values which from there onwards are considered as symbolic. In this paper the authors propose multivariate discretization of continuous attributes as a preprocessing step of symbolic induction. The generated symbolic values represent not only a single continuous attribute, but a multidimensional discretization of many continuous attributes. The novel approach is to merge several continuous attributes in order to discretize them and to use this multivariate discretization as a preprocessor for the symbolization of continuous attributes in inductive learning. Furthermore the authors propose the Q* algorithm which is capable of learning multivariate prototypes in an Euclidean space. It is a self-organizing supervised learning method which condenses the raw sample data to a representative set of prototypes. The algorithm can be used for the multivariate quantization philosophy that is proposed in this text. Experimental results are presented for a classification task. Instead of the normally univariate quantization, multivariate quantization using Q* is employed. 19 refs., 6 figs., 3 tabs.

28181 (ORNL/TM–12375, pp. 125-139) **Linguistic tools for intelligent systems.** Stillman, B. (Univ. of Colorado, Denver (US)). Oak Ridge National Lab., TN (United States). May 1993. (CONF-9306151–: 7. international symposium on methodologies for intelligent systems, Trondheim (Norway), 15-18 Jun 1993). In *Proceedings of the Seventh International Symposium on Methodologies for Intelligent Systems (Poster Session)*. 174p. Order Number DE93013470. Source: OSTI; NTIS.

The objective of the research considered in this paper is to develop formal linguistic tools for the representation of large-scale hierarchical complex systems, the so-called Linguistic Geometry. The research relies on the formalization of heuristics of high-skilled human experts which have resulted in the development of successful decision support systems. This approach is based on a broad application of the theory of formal languages and grammars as well as theories of formal problem-solving and planning on the basis of the first-order predicate calculus. This paper reports new results in the investigation of geometrical properties of the first-level subsystems (paths of elements) unified as One-Dimensional Linguistic Geometry. 28 refs., 3 figs., 1 tab.

28182 (ORNL/TM–12375, pp. 140-150) **An application of rough sets in knowledge synthesis.** Wong, S.K.M. (Univ. of Regina, Saskatchewan (CA)); Yao, Y.Y.; Wang, L.S. Oak Ridge National Lab., TN (United States). May 1993. (CONF-9306151–: 7. international symposium on methodologies for intelligent systems, Trondheim (Norway), 15-18 Jun 1993). In *Proceedings of the Seventh International Symposium on Methodologies for Intelligent Systems (Poster Session)*. 174p. Order Number DE93013470. Source: OSTI; NTIS.

In this paper, the authors consider the fundamental issues in knowledge verification and synthesis by focusing on a special type of rule-based systems, which consists of a set of deterministic and non-deterministic decision rules. A set of sound and complete inference axioms is suggested. Based on these axioms, an efficient algorithm is developed for computing the closure and testing the consistency of the input rules. 18 refs.

28183 (PNL-SA–21610) **Automation of constrained-value business forms.** Carson, M.L.; Beaumariage, T.G.; Greitzer, F.L. Pacific Northwest Lab., Richland, WA (United States). May 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9305218–1: 2. international engineering research conference, Los Angeles, CA (United States), 23-26 May 1993). Order Number DE93015677. Source: OSTI; NTIS; GPO Dep.

Expert systems can improve many business tasks. However, the nature of a constrained-value business form can result in a rule base that contains circular reasoning, unsuitable for expert system implementation. A methodology is presented for restructuring such a rule base for compatibility with a backward-chaining expert system.

28184 (SAND–92-2059C) **A general contact detection algorithm for finite element analysis.** Heinstein, M.W.; Attaway, S.W.; Swegle, J.W.; Mello, F.J. Sandia National Labs., Albuquerque, NM (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930782–1: 1. international conference in contact mechanics, Southampton (United Kingdom), 13-15 Jul 1993). Order Number DE93012846. Source: OSTI; NTIS; GPO Dep.

A contact detection algorithm has been developed to address difficulties associated with the numerical simulation of contact in nonlinear finite element structural analysis codes. Mechanics problems which have self-contacting surfaces, tearing and eroding surfaces, and multi-body impact are solved using the new algorithm. The proposed algorithm is portable between dynamic and quasi-static codes and can efficiently model contact between a variety of finite element types including shells, bricks, beams and particles. The algorithm is composed of (1) a location strategy that uses a global search to decide which slave nodes are in proximity to a master surface and (2) an accurate detailed contact check that uses the projected motions of both master surface and slave node. The capability of the new algorithm is illustrated with several example problems.

28185 (SAND–92-2765) **An efficient parallel algorithm for matrix-vector multiplication.** Hendrickson, B.; Leland, R.; Plimpton, S. Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93015125. Source: OSTI; NTIS; GPO Dep.

The multiplication of a vector by a matrix is the kernel computation of many algorithms in scientific computation. A fast parallel

algorithm for this calculation is therefore necessary if one is to make full use of the new generation of parallel supercomputers. This paper presents a high performance, parallel matrix-vector multiplication algorithm that is particularly well suited to hypercube multiprocessors. For an n x n matrix on p processors, the communication cost of this algorithm is $O(n/\sqrt{p} + \log(p))$, independent of the matrix sparsity pattern. The performance of the algorithm is demonstrated by employing it as the kernel in the well-known NAS conjugate gradient benchmark, where a run time of 6.09 seconds was observed. This is the best published performance on this benchmark achieved to date using a massively parallel supercomputer.

28186 (SAND–93-0735) **Locally non-uniform finite-difference time domain with application to stealth, crosstalk, and narrow apertures.** Riley, D.J. Sandia National Labs., Albuquerque, NM (United States). Apr 1993. 104p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013958. Source: OSTI; NTIS; GPO Dep.

A technique to integrate a dense, locally non-uniform mesh into finite-difference time-domain (FDTD) codes is presented. The method is designed for the full-wave analysis of multi-material layers that are physically thin, but perhaps electrically thick. Such layers are often used for the purpose of suppressing electromagnetic reflections from conducting surfaces. Throughout the non-uniform local mesh, average values for the conductivity and permittivity are used, where as variations in permeability are accommodated by splitting H-field line integrals and enforcing continuity of the normal B field. A unique interpolation scheme provides accuracy and late-time stability for mesh discontinuities as large as 1000 to 1. Application is made to resistive sheets, the absorbing Salisbury screen, crosstalk on printed circuit boards, and apertures that are narrow both in width and depth with regard to a uniform cell. Where appropriate, comparisons are made with the MoM code CARLOS and transmission-line theory. The hybrid mesh formulation has been highly optimized for both vector and parallel-processing on Cray YMP architectures.

28187 (SAND–93-0961) **Refining and defining the Program Dependence Web.** Campbell, P.L. (Sandia National Labs., Albuquerque, NM (United States)); Krishna, K.; Ballance, R.A. Sandia National Labs., Albuquerque, NM (United States). May 1993. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93014852. Source: OSTI; NTIS; GPO Dep.

The Program Dependence Web (PDW) is an intermediate representation for a computer program, which can be interpreted under control-driven, data-driven or demand-driven disciplines. This document completes the definition for the PDW. This includes operational definitions for the nodes and arcs and a description of how PDWs are interpreted. The general structure for conditionals and loops is shown, accompanied by examples. The definition provided here is a refinement of the original one: a new node, the "β node," replaces the μ node, and the η^T node is eliminated.

28188 (SAND–93-1002C) **A perspective on AVS in an engineering sciences environment.** Glass, M.W. Sandia National Labs., Albuquerque, NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9305168–3: Application Visualization System (AVS) '93 users group meeting, Orlando, FL (United States), 24-26 May 1993). Order Number DE93015011. Source: OSTI; NTIS; GPO Dep.

At Sandia National Laboratories, the Engineering Sciences Center has made a commitment to integrate Application Visualization System (AVS) into our computing environment as the primary tool for scientific visualization. AVS will be used on an everyday basis by a broad spectrum of users ranging from the occasional computer user to AVS module developers. Additionally, AVS will be used to visualize structured grid, unstructured grid, gridless, 1D, 2D, 3D, steady-state, transient, computational, and experimental data. The following is one user's perspective on how AVS meets this task. Several examples of how AVS is currently being utilized will be given along with some future directions.

28189 (SAND–93-1353C) **C++ as a language for object-oriented numerics.** Budge, K.G.; Peery, J.S.; Robinson, A.C.; Wong, M.K. Sandia National Labs., Albuquerque, NM (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930791–1: European C++ Users Group meeting, Munich (Germany), 7-9 Jul 1993). Order Number DE93015027. Source: OSTI; NTIS; GPO Dep.

C++ is commonly described as an object-oriented programming language because of its strong support for classes with multiple inheritance and polymorphism. However, for a growing community of numerical programmers, an equally important feature of C++ is its support of operator overloading on abstract data types. The authors choose to call the resulting style of programming object-oriented numerics. They believe that much of object-oriented numerics is orthogonal to conventional object-oriented programming. As a case study, they discuss two strong shock physics codes written in C++ that they're currently developing. These codes use both polymorphic classes (typical of traditional object-oriented programming) and abstract data types with overloaded operators (typical of object-oriented numerics). They believe that C++ translators can generate efficient code for many numerical objects. However, for the important case of smart arrays (which are used to represent matrices and the fields found in partial differential equations) fundamental difficulties remain. The authors discuss the two most important of these, namely, the aliasing ambiguity and the proliferation of temporaries, and present some possible solutions.

28190 (SLAC-PUB–5967) **Overview of the Scalable Coherent Interface, IEEE STD 1596 (SCI).** Gustavson, D.B. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); James, D.V.; Wiggers, H.A. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-921005–34: Institute of Electrical and Electronic Engineers (IEEE) nuclear science symposium and medical imaging conference, Orlando, FL (United States), 26-31 Oct 1992). Order Number DE93015247. Source: OSTI; NTIS; INIS; GPO Dep.

The Scalable Coherent Interface standard defines a new generation of interconnection that spans the full range from supercomputer memory 'bus' to campus-wide network. SCI provides bus-like services and a shared-memory software model while using an underlying, packet protocol on many independent communication links. Initially these links are 1 GByte/s (wires) and 1 GBit/s (fiber), but the protocol scales well to future faster or lower-cost technologies. The interconnect may use switches, meshes, and rings. The SCI distributed-shared-memory model is simple and versatile, enabling for the first time a smooth integration of highly parallel multiprocessors, workstations, personal computers, I/O, networking and data acquisition.

28191 (SOL–93-3) **A sequential quadratic programming algorithm using an incomplete solution of the subproblem.** Murray, W. (Stanford Univ., CA (United States). Systems Optimization Lab.); Prieto, F.J. Stanford Univ., CA (United States). Systems Optimization Lab. May 1993. 54p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract FG03-92ER25117. Grant DDM-9204208;Grant N00014-90-J-1242;Grant NATO500525. Order Number DE93017439. Source: OSTI; NTIS; GPO Dep.

We analyze sequential quadratic programming (SQP) methods to solve nonlinear constrained optimization problems that are more flexible in their definition than standard SQP methods. The type of flexibility introduced is motivated by the necessity to deviate from the standard approach when solving large problems. Specifically we no longer require a minimizer of the QP subproblem to be determined or particular Lagrange multiplier estimates to be used. Our main focus is on an SQP algorithm that uses a particular augmented Lagrangian merit function. New results are derived for this algorithm under weaker conditions than previously assumed; in particular, it is not assumed that the iterates lie on a compact set.

28192 (SSI–92-12) **Lena$_W$in 1.0, user's guide.** Baeverstam, U. Swedish Radiation Protection Inst., Stockholm (Sweden). Aug 1992. [29p.] Order Number DE93631734. Source: OSTI; NTIS; INIS.

Lena$_W$in is a program for dispersion and dose calculations, mainly connected to accidents in nuclear facilities. Besides that, it may, however, also be used for other kinds of releases. It is designed to be used both for training purpose, and in real situations. Great care has therefore been taken to ensure a simple and quick handling of the program, also in difficult situations. The program is a true Windows application, and works with version 3.0 and higher of Microsoft Windows. It was developed at the Swedish Radiation Protection Institute (SSI) during 1991-1992, and is used by the institute in its regular work. Lena$_W$in is part in a larger system to handle accidental situations. An important part of this system is a database and a database handler to manage all kinds of measured data after a release. Lena$_W$in has functions to display data taken from this database on maps.

28193 (UCRL-JC–109851) **Standards and practices for reliable safety-related software systems.** Sparkman, D. Lawrence Livermore National Lab., CA (United States). Mar 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9210357–1: 3. international symposium on software reliability engineering, Triangle Park, NC (United States), 7-9 Oct 1992). Order Number DE93012591. Source: OSTI; NTIS; GPO Dep.

Safety and reliability are of increasing concern as mechanical systems are replaced or upgraded with computer-based software technology as we move into the 21st century. As these systems are installed in ever increasing numbers. Their impact on the safety of our environment, finances, and physical well-being grows. The operators, patients, owners, and customers of these systems want assurances that these systems are safe. The developers of these systems attempt to follow standards and industry recognized practices in the hope of providing this assurance. This paper is the result of an evaluation of domestic and international, industry and government accepted practices and standards relating to software safety and reliability. Standards were evaluated for similarities and variance. There are three areas of interest when discussing the development of safety-related software systems. These are the quality enhancing development processes, safety analysis techniques, and measurement techniques for assessing reliability or safety.

28194 (UCRL-JC–110110) **Visualization of high resolution, three-dimensional, nonlinear finite element analyses.** Christon, M.A.; Spelce, T.E. Lawrence Livermore National Lab., CA (United States). 24 Mar 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921079–5: Visualization 1992, Boston, MA (United States), 19-23 Oct 1992). Order Number DE93015979. Source: OSTI; NTIS; GPO Dep.

A two-pass surface extraction algorithm for adaptive finite element meshes is presented in the context of a visualization study for a particle impact and a turbine containment problem. The direct use of finite element data structures for the computation of external surfaces, surface normals, and derived physical quantities is discussed. An overview of the in-betweening algorithm which compensates for rigid body dynamics is presented with a brief discussion of a "direct-to-videodisk" animation strategy.

28195 (UCRL-JC–111558-Rev.1) **Storage systems for national information assets: Revision 1.** Coyne, R.A. (IBM Federal Systems Div., Houston, TX (United States)); Hulen, H.; Watson, R. Lawrence Livermore National Lab., CA (United States). 17 Feb 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921125–7: ACM/IEEE supercomputing conference, Minneapolis, MN (United States), 14-21 Nov 1992). Order Number DE93015101. Source: OSTI; NTIS; GPO Dep.

An industry-led collaborative project, called the National Storage Laboratory, has been organized to investigate technology for storage system that will be the future repositories for our national information assets. Lawrence Livermore National Laboratory through its National Energy Research Supercomputer Center (NERSC) is the operational site and the provider of applications. It is anticipated that the integrated testbed system will represent a significant advance in the technology for distributed storage system capable of handling gigabyte class files at gigabit-per-second data rates.

28196 (UCRL-JC–111816-Rev.1) **The National Storage Laboratory: A collaborative research project: Revision 1.** Coyne, R.A. (International Business Machines Corp., Houston, TX (United States)); Hulen, H.; Watson, R. Lawrence Livermore National Lab., CA (United States). 17 Feb 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920966–25-Rev.1: 10. conference on computing in high energy physics, Annecy (France), 21-25 Sep 1992). Order Number DE93015099. Source: OSTI; NTIS; GPO Dep.

Large scientific, engineering and commercial applications are straining storage and networking facilities, a condition compounded by new supercomputers, massively parallel processors, and workstations. An application driven, industry-led, collaborative, storage testbed project centered at Lawrence Livermore National Laboratory (LLNL), called the National Storage Laboratory, has been organized to investigate, demonstrate, and commercialize technology to remove performance bottlenecks and to provide new needed storage system functionality. The experience of the project will also contribute to the work of the IEEE Storage System Standards Working Group.

28197 (UCRL-JC–112195) **Programming the multimodal interface.** Glinert, E.P. (Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Computer Science); Blattner, M.M. Lawrence Livermore National Lab., CA (United States). 10 Sep 1992. 8p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-48. CDA-8805910. (CONF-9304147–1: INTERCHI '93: interact and computation human interaction, Amsterdam (Netherlands), 24-29 Apr 1993). Order Number DE93013084. Source: OSTI; NTIS; GPO Dep.

Fundamental problems will confront those who wish to take full advantage of the power of tomorrow's multimodal environments. We argue that our recently introduced concept of meta-widget, when embedded within a high level, networked user interface server, can support the effective implementation of complex multimedia applications. We develop algorithms which enable a multimodal system to select the "best" combination of representations for the various "information packets" in a display at any moment. If no acceptable - combination of available representations can be found, strategies are provided for creating a new and useful, if not beautiful, representation to resolve the impasse. A running example is provided to motivate and clarify the discussion.

28198 (UCRL-JC–112572) **A Task Adaptive parallel graphics renderer.** Whitman, S. Lawrence Livermore National Lab., CA (United States). 21 Dec 1992. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930881–3: Siggraph '93 conference, Anaheim, CA (United States), 2-6 Aug 1993). Order Number DE93017123. Source: OSTI; NTIS; GPO Dep.

This paper presents a graphics renderer which incorporates new partitioning methodologies of memory and work for efficient execution on a parallel computer. The Task Adaptive domain decomposition scheme is an image space method involving dynamic partitioning of rectangular pixel area tasks. The author shows that this method requires little overhead, allows coherence within a parallel context, handles worst case scenarios effectively, and executes efficiently with little processor synchronization necessary. Previous research in the area of memory and work decompositions for graphics rendering has been primarily limited to simulation studies and little practical experience. The algorithm presented here has been implemented on a scalable distributed memory multiprocessor and tested on a variety of input scenes. The author presents a theoretical and practical analysis in order to contrast its predicted and actual success. The implementation analysis indicates that load imbalance is the major cause of performance degradation at the higher processor counts. Even so, on a variety of test scenes, an average rendering speedup of 79 was achieved utilizing 96 processors on the BBN TC2000 multiprocessor with a processor efficiency range of 66% to 94%.

28199 (UCRL-JC–113106) **Control of movement in an arbitrary polygonal terrain.** Cunningham, C.T. Lawrence Livermore National Lab., CA (United States). 4 Feb 1993. 10p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9303101–2: 3. conference on computer generated forces and BR, Orlando, FL (United States), 17-19 Mar 1993). Order Number DE93016539. Source: OSTI; NTIS; GPO Dep.

Efficient algorithms are presented for coordinated movement of semi-automated, computer-generated forces in a command hierarchy. At each level in the hierarchy, units move toward a goal, selected at a higher level, along paths which combine maintenance of a desired formation with minimization of a penalty integral – some weighted combination of factors such as time, fuel, exposure, attrition, etc. Topics considered are the representation of terrain as a convex polygonal mesh, generalization of the A* pathfinding algorithm to a 2-D surface, fields of extremal paths, flexible formation templates, and synchronization and adaptive replanning.

28200 (UCRL-MA–108964-Rev.1) **PPC user's manual: Revision 1.** Brown, S.A.; Barrett, K.A.; Braddy, D. Lawrence Livermore National Lab., CA (United States). 4 Jan 1993. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93015988. Source: OSTI; NTIS; GPO Dep.

The Portable Process Control library (PPC) is a set of routines to execute and communicate with other processes in environments which permit such operations. The goal is to establish an easy to use interface which can be implemented on a wide variety of platforms. The standard C library I/O interface was taken as a model. In this view, processes are treated as much like files as is possible. In particular, a process is opened and closed as is a file and that means that it is forked by the parent to start with and killed at the end. While a process is open it may be written to and read from with PPC functions which are analogous to the standard C I/O functions fprintf and fgets. In addition, there are functions to monitor the status of the child processes. These do not have precise analogs to file routines, but since the basic interface has been established by the open/close and read/write routines, these have obvious usages.

28201 (UCRL-MA–108966-Rev.1) **PGS user's manual for PGS Version 2.0: Revision 1.** Brown, S.A.; Braddy, D. Lawrence Livermore National Lab., CA (United States). 4 Jan 1993. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93015985. Source: OSTI; NTIS; GPO Dep.

One of the biggest headaches for portability is graphics. The objective evidence is that the field is immature. One cannot exactly say that there are no graphics standards. The real problem is that there are too many standards. PGS is an application program interface (API) that is independent of the underlying host graphics system. All of the graphics portability headaches are confined to PGS and applications which use PGS are completely portable. PGS currently sits on top of X Windows on UNIX platforms, Quickdraw on Macintoshes, and Microsoft's graphics library on DOS platforms. PGS takes a least common denominator approach regarding what graphics functionality it supports. The goal is to run on the widest variety of machines. This model will almost certainly change in time as both graphics hardware and software evolve and become ubiquitous across platforms. PGS structures display surfaces with a viewport defined in normalized coordinates, an enclosing boundary where axes are drawn which is defined as a set of offsets from the viewport window, and a world coordinate system attached to the viewport. The enclosing boundary is useful for obtaining a standoff between rendered data such as line plots and the axes used to measure the rendering. PGS supports both line and text drawing primitives, line and text attributes, and bit maps for handling images and other cell array data. Most functionality in PGS is either primitive operations such as moves and draws or at a very high level such as axis drawing and the rendering algorithms that it supports. These rendering algorithms have two interfaces: one for "raw" data; and one for PML type mappings. This gives a great deal of flexibility to the application developer. PGS has the following rendering algorithms currently: 1D line plots; 2D contour plots; 2D vector plots; 2D image plots; 3D wire frame mesh plots (for 2D data sets); and Grotrian diagram plots.

28202 (UCRL-MA–108967-Rev.1) **ULTRA II user's manual for ULTRA II Revision 3.0: Revision 1.** Brown, S.A.; McMillan, C.F.; Braddy, D.; Keller, P. Lawrence Livermore National Lab., CA (United States). 4 Jan 1993. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93015970. Source: OSTI; NTIS; GPO Dep.

ULTRA II is a program for the presentation, manipulation, and analysis of 1D data sets (i.e., x, y pairs). Presentation refers to the capability to display, and make hard copies of data plots. Manipulation refers to the capability to excerpt, shift, and scale data sets. Analysis refers to the capability to combine data sets in various ways to create new data sets. An example of this is the Fast Fourier Transform (FFT) capability in ULTRA II. The principal object with which ULTRA II works is the curve. A curve is an object which consists of an array of x values, an array of y values, a number of points (the length of the x and y arrays), and an ASCII label. ULTRA II operates on curves. ULTRA II is a portable tool. It runs on machines from supercomputers to PCs. It runs under UNIX, DOS, and MAC OS. Its portability derives from the PACT libraries which provide the portable graphics and the SCHEME interpreter engine which are the main foundation of ULTRA II. ULTRA II can read and write ASCII data files or PDB files with ULTRA curves in them. PDBLib is another PACT tool which provides portable, self-describing, binary data files. PDBLib has specific functionality to write ULTRA curves. This provides an easy and convenient way for applications to produce ULTRA files. The advantage of PDB files over ASCII files is that PDB files are about 1/3 the size of a corresponding ASCII file and can be written or read about 10 times faster. Interested readers will find references to PACT documentation later in this manual.

28203 (UCRL-MA–108975-Rev.1) **PDBDiff user's manual for PDBDiff Version 2.0: Revision 1.** Brown, S.A.; Braddy, D. Lawrence Livermore National Lab., CA (United States). 4 Jan 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93015986. Source: OSTI; NTIS; GPO Dep.

The PACT system provides a number of tools for working with PDB files in a fairly generic fashion. In particular, PDBDiff compares the contents of two PDB files and displays the differences (in a manner similar but not identical to the UNIX utility diff). PDBDiff can also be run in an interactive mode which allows one to compare two PDB files on a variable by variable or even leaf by leaf basis. PDBDiff is an SX program. SX is the SCHEME dialect of the LISP programming language with PACT extensions. The extensions provide functionality for graphics, binary data handling, and other areas of functionality. PDBDiff has a help command which provides information about available commands. Note: The files compared may have been created on or for different target machines. Consequently, a given data type may be represented differently in the two files. In this event values are compared to the precision in the first file, or the precision in the second file, or the precision you specify, whichever is least.

28204 (UCRL-MA–108976-Rev.1) **SCORE user's manual: Revision 1.** Brown, S.A.; Braddy, D. Lawrence Livermore National Lab., CA (United States). 4 Jan 1993. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93015987. Source: OSTI; NTIS; GPO Dep.

PACT is a set of tools to facilitate the development of portable scientific software and to visualize scientific data. As with most constructs, PACT has a foundation. In this case that foundation is SCORE. SCORE (System CORE) has two main functions. The first and perhaps most important is to smooth over the differences between different C implementations and define the parameters which drive most of the conditional compilations in the rest of PACT. Second, it contains several groups of functionality that are used extensively throughout PACT. Although C is highly standardized now, that has not always been the case. Roughly speaking C compilers fall into three categories: ANSI standard; derivative of the Portable C Compiler (Kernighan and Ritchie); and the rest. PACT has been successfully ported to many ANSI and PCC systems. It has never been successfully ported to a system in the last category. The reason is mainly that the "standard" C library supplied with such implementations is so far from true ANSI or PCC standard that PACT would have to include its own version of the standard C library in order to work at all. SCORE's job is to include

the requisite standard headers and ensure that certain key standard library functions exist and function correctly so that, to applications which include the SCORE header(s) and load with SCORE, all C implementations look the same. Once SCORE has been successfully compiled, only the areas of graphics, IPC, and binary data handling require special handling.

28205 (WSRC-IM–90-83-9) **Reviews of computing technology: Object-oriented technology.** Skeen, D.C. Westinghouse Savannah River Co., Aiken, SC (United States). 1 Mar 1993. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014740. Source: OSTI; NTIS; GPO Dep.

A useful metaphor in introducing object-oriented concepts is the idea of a computer hardware manufacturer assembling products from an existing stock of electronic parts. In this analogy, think of the parts as pieces of computer software and of the finished products as computer applications. Like its counterpart, the object is capable of performing its specific function in a wide variety of different applications. The advantages to assembling hardware using a set of prebuilt parts are obvious. The design process is greatly simplified in this scenario, since the designer needs only to carry the design down to the chip level, rather than to the transistor level. As a result, the designer is free to develop a more reliable and feature rich product. Also, since the component parts are reused in several different products, the parts can be made more robust and subjected to more rigorous testing than would be economically feasible for a part used in only one piece of equipment. Additionally, maintenance on the resulting systems is simplified because of the part-level consistency from one type of equipment to another. The remainder of this document introduces the techniques used to develop objects, the benefits of the technology, outstanding issues that remain with the technology, industry direction for the technology, and the impact that object-oriented technology is likely to have on the organization. While going through this material, the reader will find it useful to remember the parts analogy and to keep in mind that the overall purpose of object-oriented technology is to create software parts and to construct applications using those parts.

28206 (DOE/AD–0043) **Information resources management long-range plan, FY1994–1998.** USDOE Office of Information Resources Management, Washington, DC (United States). Apr 1993. 145p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013898. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes IRM activities and the information technology resources and capabilities of the Department, the future requirements, and the strategies and plans to satisfy the identified requirements. The long-range planning process provides the systematic means to meet this objective and assists the Department in assuring that information technology (IT) support is provided in an efficient, effective, and timely manner so that its programmatic missions can be accomplished. Another important objective of the Plan is to promote better understanding, both within and external to the Department, of its IT environment, requirements, issues, and recommended solutions. This DOE IRM Plan takes into consideration the IRM requirements of approximately 50 different sites. The annual long-range planning cycle for supporting this Plan was initiated by a Call in August 1991 for site plans to be submitted in February 1992 by those Departmental components and contractors with major IRM requirements.

28207 (DOE/AD–0044) **Information Technology Resources Assessment.** USDOE Office of Information Resources Management, Washington, DC (United States). Apr 1993. 70p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013899. Source: OSTI; NTIS; GPO Dep.

The Information Technology Resources Assessment (ITRA) is being published as a companion document to the Department of Energy (DOE) FY 1994–FY 1998 Information Resources Management Long-Range Plan. This document represents a collaborative effort between the Office of Information Resources Management and the Office of Energy Research that was undertaken to achieve, in part, the Technology Strategic Objective of IRM Vision 21. An integral part of this objective, technology forecasting provides an understanding of the information technology horizon and presents a perspective and focus on technologies of particular interest to DOE program activities. Specifically, this document provides site planners with an overview of the status and use of new information technology for their planning consideration.

28208 (DOE/MA/33222–T1) **Emerging technologies planning guide, 1993 edition.** USDOE Office of Administration and Human Resource Management, Washington, DC (United States). DOE-Wide Project Support Branch; Computer Data Systems, Inc., Germantown, MD (United States). Nov 1992. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-88MA33222. Order Number DE93017196. Source: OSTI; NTIS; GPO Dep.

Information system technology enhancements during the next five years are expected to provide some of the most significant individual and organization work improvements ever made in the office environment. This guide is an aid to planning these technologies and assessing their roles in improving the effectiveness of Headquarters programs. Their implementation will cost-effectively support Departmental operations and the National Energy Strategy. At the hear of this process is an understanding of the relationship which exists between technology introduction and the planning, budgeting and acquisition process. The 1993 edition of this guide covers the 1993–1997 time frame.

28209 (FEI–2035) **ENSDF file nuclear data for application problems.** Grudzevich, O.T.; Zelenetskij, A.V.; Pashchenko, A.B. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1989. [23p.] (In Russian). Order Number DE93629816. Source: OSTI; NTIS (US Sales Only); INIS.

Specialized targeted data libraries are prepared on the basis of ENSDF file of 1989 version; the libraries include the file of spectra of discrete levels and statistic characteristics of excited nuclei and the file of spectroscopic data for activation analysis. Data representation formats in this files are discussed. 7 refs.; 4 tabs.

28210 (FEI–2043) **BOSPOR library software: CSCHANGE program.** Grudzevich, O.T.; Zelenetskij, A.V.; Pashchenko, A.B. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1989. [13p.] (In Russian). Order Number DE93629817. Source: OSTI; NTIS (US Sales Only); INIS.

The CSCHANGE program designed for correction and processing of the BOSPOR library data in the interactive mode using the personal computer is presented. The program is written in FORTRAN-77 and installed at IBM PC XT/AT and compatible computers. 6 refs.; 3 tabs.

28211 (FEI–2055) **Comparative analysis of systematics on (n,p) reaction cross sections at neutron energy ≃14-15 MeV.** Badikov, S.A.; Pashchenko, A.B. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1989. [17p.] (In Russian). Order Number DE93629818. Source: OSTI; NTIS (US Sales Only); INIS.

Comparative analysis of systematics of (n,p) reaction cross sections is performed for En≈14.5 MeV using data library compiled on the basis of the results of experiments which were published before 1990. Refined values of systematic parameters, recommended values of cross sections and errors are presented. 21 refs.; 2 tabs.

28212 (JINR-R–10-92-5) **The usage of the data base for the experimental data mass processing control.** Ivanov, V.G.; Ehrdehnehdehlgehr, T. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1992. [11p.] (In Russian). Order Number DE93629815. Source: OSTI; NTIS (US Sales Only); INIS.

A system for organizing and using the data base concerning the origin of the problem and data running during experimental data mass processing is considered. The personal computer compatible with IBM PC/XT/AT is required for operating the system. 4 refs.; 4 figs.

28213 (LBL–32165-Rev.3) **Public census data on CD-ROM at Lawrence Berkeley Laboratory: Revision 3.** Merrill, D.W. Lawrence Berkeley Lab., CA (United States). 16 Jan 1993. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015292. Source: OSTI; NTIS; GPO Dep.

The Comprehensive Epidemiologic Data Resource (CEDR) and Populations at Risk to Environmental Pollution (PAREP) projects, of the Information and Computing Sciences Division (ICSD) at Lawrence Berkeley Laboratory (LBL), are using public socioeconomic and geographic data files which are available to CEDR and PAREP collaborators via LBL's computing network. At this time 72 CD-ROM diskettes (approximately 37 gigabytes) are on line via the Unix file server "cedrcd.lbl.gov". Most of the files are from the US Bureau of the Census, and many of these pertain to the 1990 Census of Population and Housing. All the CD-ROM diskettes contain documentation in the form of ASCII text files. In addition, printed documentation for most files is available for inspection at University of California Data and Technical Assistance (UC DATA), tel. (510) 642-6571, or the UC Documents Library, tel. (510) 642-2569, both located on the UC Berkeley Campus. Many of the CD-ROM diskettes distributed by the Census Bureau contain software for PC compatible computers, for easily accessing the data. Shared access to the data is maintained through a collaboration among the CEDR and PAREP projects at LBL, and UC DATA, and the UC Documents Library. LBL is grateful to UC DATA and the UC Documents Library for the use of their CD-ROM diskettes. Shared access to LBL facilities may be restricted in the future if costs become prohibitive. Via the Sun Network File System (NFS), these data can be exported to Internet computers for direct access by the user's application program(s). Due to the size of the files, this access method is preferred over File Transfer Protocol (FTP) access. Please contact Deane Merrill (dwmerrill@lbl.gov) if you wish to make use of the data.

28214 (SAND–93-0869C) **Making the connection between information modeling and implementation.** Eaton, M.J. Sandia National Labs., Albuquerque, NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9305161–2: INGRES world '93 conference, Santa Clara, CA (United States), 9-13 May 1993). Order Number DE93011588. Source: OSTI; NTIS; GPO Dep.

Over the past several years the Information Technology Department at Sandia Laboratories has developed information systems based on a solid foundation of information modeling and data administration. The output of the information modeling efforts is a fifth normal form relational table structure and associated data constraints. Developers would then implement the system by creating end-user application software. Traditionally, the development process combined the code necessary for maintaining data constraints with the code to provide the user interface (i.e. forms, windows, etc.). This approach has an adverse effect on the maintainability of the software as the system (i.e. the information model) changes over time. This paper will discuss the application of a direct connection between the information model and the implementation of a database with associated code to maintain required data constraints. The automated generation of this code allows the developers to concentrate on the user interface code development. The technique involves generating database procedure code automatically from the information modeling process. The database procedure code will enforce the data constraints defined in the information model. This has resulted in a fully functional database with complete rules enforcement within days of a completed information model. This work used the Knowledge Management Extensions of the Ingres database software. Changes to the architecture of both Application By Forms (ABF) and Ingres Windows4GL client applications required by this process will also be discussed.

28215 (WHC-SA–1781) **The evolving roles of technical communicators within a government project: The Hanford Site.** Forbes, C.J. Westinghouse Hanford Co., Richland, WA (United States). Jun 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930630–2: Society for Technical Communication conference, Dallas, TX (United States), 10-13 Jun 1993). Order Number DE93014588. Source: OSTI; NTIS; GPO Dep.

This presentation describes the present-day workplace for technical communicators at the United States Department of Energy's Hanford Site. Factors that are significantly affecting the Hanford Site workplace are identified, with emphasis on the effects of these factors on the workplace activities of Hanford Site technical communication professionals.

9904 Law

28216 (IAEA-TECDOC–703) **Guidelines for IAEA International Regulatory Review Teams (IRRTs).** International Atomic Energy Agency, Vienna (Austria). Apr 1993. [47p.] Order Number DE93631721. Source: OSTI; NTIS (US Sales Only); INIS.

This document is intended to be used by International regulatory review teams in reviewing the activities of a regulatory body as applicable to the regulation of nuclear power plants. The mission will, however, take note of any other activities of the regulatory body when drawing up the review report. The document does not specifically deal with the functions of a regulatory body responsible for other types of nuclear facilities or related nuclear activities, but it is intended that the concepts presented in the document could be applied where appropriate. Refs.

28217 (INIS-mf–12758, pp. 171-175) **Quality assurance programmes and normalization for the Argentine-Brazilian integration.** Biernat, A.E. (Empresa Nuclear Argentina de Centrales Eiectricas SA (ENACE), Buenos Aires (Argentina)). Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

Within the frame of the tasks developed by the Argentine-Brazilian Contractors Coordination Committee in the nuclear area, which was at the beginning promoted by the Contractor Committee of the Argentine Association of Nuclear Technology, a working team was created between both countries in order to analyze the existing regulations and the Quality Assurance systems applied in Brazil and Argentina for their nuclear projects. This paper describes the steps to be followed so as to fulfill the compatibility of the rules, quality assurance and firm certification, laboratories, personnel and materials, and the applicable quality assurance programmes. At first, the methodology applied was the collection of the information and the existing regulations in each one of the countries, to exchange them, analyze them and arrange joint meetings and organize a seminar with experts from both countries to develop and discuss the objectives of this working team. As a result of these activities, the criteria adopted will allow, together with another actions, that both Argentine and Brazilian firms make exchanges and integrations in the nuclear field to supply Atucha II and Angra II. (Author).

28218 (INIS-mf–12758, pp. 176-181) **Relevant aspects of a quality assurance program applied to a nuclear power plant operation.** Fernandez, J.C. (Comision Nacional de Energia Atomica, Embalse (Argentina). Central Nuclear en Embalse). Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of this work was to enumerate the most relevant subjects to be taken into account for the elaboration of a Quality Assurance Program aimed to regulate a nuclear power plant operation. At first, it was necessary to point out the relevance that

implies the presence of a group of personnel, experienced in quality assurance with enough knowledge on the technical and organizing aspects of the plant. Other aspect to be taken into account was the contemplation of the international requirements, through the International Atomic Energy Agency and of the national requirements that each country had set up by the corresponding regulating agencies. These organizations pointed out the minimum rules that must be followed for the adequate and efficient execution of a program. The Quality Assurance Manual and the program and work procedures constituted the Quality Assurance Program which must be checked as regards its fulfillment by auditors and quality assurance supervisions. (Author).

Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in ETDE/PUB–3, *International Energy: Research Organizations 1986–1990*. Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, indicated by International Organization for Standardization (ISO) country code; and (3) the language of the document if non-English (R;CA;In French). Author affiliations are not listed in this index.

Express-analysis of irradiated steel mechanical properties, 18:26630 (RA;UA;In Russian)

Fracture mechanics behaviour of neutron irradiated austenitic steel 0Kh16N15M3B, 18:26671 (RA;UA;In Russian)

Heat conductivity of irradiated GaP crystals and details of their thermal annealing, 18:26653 (RA;UA;In Russian)

Helium atom doping of molybdenum and its influence on the radiation hardenings, 18:26631 (RA;UA;In Russian)

Helium atoms behaviours in aluminium and its alloys, 18:26634 (RA;UA;In Russian)

Hydrogen interaction with radiation defects of Fe and Mo, 18:27920 (RA;UA;In Russian)

Hydrogen permeability of constructor materials during ion bombardment, 18:26638 (RA;UA;In Russian)

Hydrogen permeation in austenite steels under neutron irradiation, 18:26673 (RA;UA;In Russian)

Hydrogen permeation in stainless steel type 12 Cr18Ni10T under neutron -and gamma - irradiation conditions, 18:26661 (RA;UA;In Russian)

In-reactor creep of steels and alloys with various Fe-Cr-Ni bases in the BN-350 commercial fast reactor, 18:26668 (RA;UA;In Russian)

Influence of helium and hydrogen on the embrittlement of construction materials with fcc- and bcc-lattices, 18:26632 (RA;UA;In Russian)

Influence of irradiation with 20 MeV hydrogen and helium ions on the structure and properties of construction materials and semiconductors, 18:26633 (RA;UA;In Russian)

Influence of neutron irradiation and self-irradiation on crystal structure of Pu-Al and Pu-Ga δ-phase alloys, 18:26667 (RA;UA;In Russian)

Investigation and prediction of cladding materials deformation behaviour under rapid heating, 18:26696 (RA;UA;In Russian)

Investigation of kinetics of nucleation and propagation crack in 0Kh16Ni15M3B austenite stainless steel specimens after annealing and irradiation, 18:26670 (RA;UA;In Russian)

Investigation of positron interaction with defects of the molybdenum irradiated by fast neutrons, 18:27917 (RA;UA;In Russian)

Investigation of proton-irradiated platinum by Moessbauer spectroscopy, 18:27918 (RA;UA;In Russian)

Investigation of quench induced faults in the hcp crystalline structure of zirconium alloys, 18:26678 (RA;UA;In Russian)

Investigation of the radiation creep bcc-materials with the help of anisotropic diffusion vacancy simulation in nuclei edge dislocations, 18:26647 (RA;UA;In Russian)

Irradiation effect on corrosion cracking of WWER reactors fuel element claddings ion iodium and cesium iodide medium, 18:26679 (RA;UA;In Russian)

Irradiation property changes in the structural graphites at 1500-2000^{0}C, 18:26800 (RA;UA;In Russian)

Low activated chromium-base alloys, 18:26698 (RA;UA;In Russian)

Magnetic state of $Fe_{69.5}Ni_{30.5}$ alloy with bcc-fcc transitions induced by ion irradiation, 18:26654 (RA;UA;In Russian)

Microstructural evolutions in ferritic-martensitic Kh12MVFR-type steel during irradiation and the effect of these evolutions on its radiation resistance capability, 18:26665 (RA;UA;In Russian)

On kinetics of accumulation of He and H simultaneously implanted in metal, 18:26644 (RA;UA;In Russian)

On the structural-phase change of transition metals implanted by interstitial element ions, 18:26640 (RA;UA;In Russian)

Phase stability of ordered alloys under irradiation, 18:26623 (RA;UA;In Russian)

Phase structural changes in nickel alloys in the process of thermal ageing and under irradiation, 18:26621 (RA;UA;In Russian)

Phase structure and microhardness of zirconium irradiated with carbon, nitrogen and boron ions, 18:26645 (RA;UA;In Russian)

Phase transitions in the transient metal oxides under electron irradiation, 18:26657 (RA;UA;In Russian)

Physical nature of strengthening of chromium under irradiation, 18:26687 (RA;UA;In Russian)

Positron spectroscopy of radiation defects of vanadium, 18:26614 (RA;UA;In Russian)
Processes of high-energy electron interaction with oriented single crystals, 18:27916 (RA;UA;In Russian)
Processes of primary radiation defect formation near dislocations and dislocation loops, 18:27919 (RA;UA;In Russian)
Quality improvement of radiation-resistant steels by filtration, 18:26688 (RA;UA;In Russian)
Radiation damage of boron containing materials, 18:26801 (RA;UA;In Russian)
Radiation deactivations of the long-life lived radioactive wastes with the help of median energy protons, 18:25715 (RA;UA;In Russian)
Radiation effects in thin films on the conducting materials surface, 18:26617 (RA;UA;In Russian)
Radiation growth of zirconium alloys, 18:26684 (RA;UA;In Russian)
Radiation materials science. V. 5, 18:26610 (R;UA;In Russian, English)
Radiation materials science. V. 6, 18:26628 (R;UA;In Russian, English)
Radiation materials science. V. 7, 18:26652 (R;UA;In Russian, English)
Radiation materials science. V. 8, 18:26677 (R;UA;In Russian, English)
Radiation stability or absorbing compositions with a pyrocarbon binder, 18:26798 (RA;UA;In Russian)
Radiation-acoustic studies of materials with non-linear thermoelastic properties, 18:26626 (RA;UA;In Russian)
Radiative effects and properties of refractory metals with the bcc and hcp, 18:26658 (RA;UA;In Russian)
Resistance to destruction of zirconium tubes in technological channels with account of radiation creeping and delayed hydrogen failure, 18:26695 (RA;UA;In Russian)
Second phase inclusion effect on the mechanism of irradiation nodula corrosion of the unswelling alloys, 18:26691 (RA;UA;In Russian)
Some characteristics properties of structure of stainless steel pipe blanks produced by vacuum centrifugal casting for nuclear power, 18:26664 (RA;UA;In Russian)
Space and time dissipation structures in impurity crystals under irradiation, 18:26611 (RA;UA;In Russian)
Sputtering of graphite, niobium and niobium carbide by neutron bombardment. Computer simulation, 18:26660 (RA;UA;In Russian)
Stacking fault density as engineering criterion for resistance to radiation swelling of alloys' FCC- and BCC-lattice, 18:26624 (RA;UA;In Russian)
Strain release of helium from irradiated metals and alloys, 18:26639 (RA;UA;In Russian)
Strength of technological channel tubes, 18:26683 (RA;UA;In Russian)
Structural damages of metal hafnium during reactor irradiation, 18:26694 (RA;UA;In Russian)
Structural state in ion irradiated metal systems, 18:26622 (RA;UA)
Structure and properties of the aluminium alloy SAW-1 after long-term reactor irradiation, 18:26693 (RA;UA;In Russian)
Studies of radiation effect on shape memory alloys, 18:26655 (RA;UA;In Russian)
Study of crack initiation and propagation mechanism on SCC of Zr-1%Nb VVER fuels, 18:26692 (RA;UA;In Russian)
Study of swelling and radiation creeping in construction materials of fuel assembly wrappers at BN-350 reactor on results of their form changes, 18:26699 (RA;UA;In Russian)
Study of swelling copper alloys irradiated by heavy ions, 18:26625 (RA;UA;In Russian)
Surface damage by emission of target atoms under ion bombardment, 18:26659 (RA;UA;In Russian)
Tensile properties of high nickel-base alloys Kh18N40M3B and nimonic PE-16 irradiated to neutron damage level of 60 dpa, 18:26672 (RA;UA;In Russian)
The accumulation and annealing of radiation defects in iron-chromium alloys, 18:26642 (RA;UA;In Russian)
The comparative investigation of the embrittlement of the irradiated steels and alloys with volume-centered and face-centered cubic lattices, 18:26651 (RA;UA;In Russian)
The creep of zirconium and Zr-1%Nb alloy under non-stationary irradiation by helium ions, 18:27924 (RA;UA;In Russian)
The effect of noble gas implantation of corrosion of metals and alloys, 18:26663 (RA;UA;In Russian)
The effect of radiation-induced segregation on shape and growth rate of vacancy voids, 18:26629 (RA;UA;In Russian)
The effect of the tensile stress on the swelling and microstructure of the stainless steels irradiated to high neutron fluence, 18:26675 (RA;UA;In Russian)
The influence of different factors on sputtering of metallic alloys under ion bombardment, 18:26648 (RA;UA;In Russian)
The influence of implanted helium on nickel radiation resistance under conditions simulating plasma flux disruption in nuclear fusion reactor, 18:26662 (RA;UA;In Russian)
The mechanism and mathematical model of nodule (spot) corrosion of zirconium alloys, 18:26690 (RA;UA;In Russian)
The mechanism of cascade vacancy loop nucleation in HCP zirconium, 18:26613 (RA;UA;In Russian)
The modification of some steel properties under helium implantation, 18:27923 (RA;UA;In Russian)
The structural-phenomenological description of plastic anisotropy of H-1 and H-2.5 alloys, subjected to reactors irradiation, 18:26685 (RA;UA;In Russian)
Theory of the void nucleation in crystals under intensive irradiation, 18:26619 (RA;UA)
Use of median energy proton beams in radiation damage physics and in radiation material science, 18:27922 (RA;UA;In Russian)
Vacancy and impurity complexes in the Ni-Sc system and their influence on the radiation swelling, 18:26627 (RA;UA;In Russian)
Void swelling of hexagonal wrappers of BN-600 sub-assemblies, 18:26676 (RA;UA;In Russian)
X-ray effects and swelling of some non-metallic materials after neutron irradiations, 18:26797 (RA;UA;In Russian)

Diet-meat and diet-milk transfer of ^{137}Cs in cattle: Values of dynamic model and values obtained in field, 18:27611 (R;IT)
Boston Univ., MA (United States). Dept. of Chemistry
Scintillation mechanism in stoichiometric cerium compounds, 18:26775 (R;US)
Brookhaven National Lab., Upton, NY (United States)
A γ_t-jump scheme for the Brookhaven AGS, 18:26992 (R;US)
A new formulation of longitudinal coherent instabilities, 18:26982 (R;US)
A particle bed reactor based NTP in the 112,500 N thrust class, 18:26203 (R;US)
A simulation study of linear coupling effects and their correction in RHIC, 18:27154 (R;US)
Aging assessments: A strategy for today and the future, 18:26345 (R;US)
An assessment of acid fog, 18:27271 (R;US)
An assessment of the use of CARS for remote sensing, 18:26893 (R;US)
Analysis of accidents during the mid-loop operating state at a PWR, 18:26343 (R;US)
Application of in situ scanning x-ray fluorescence to study the concentration of metal ions in simulated pits, 18:26572 (R;US)
Axial variations in the magnetic field of superconducting dipoles, 18:27038 (R;US)
Baryon distributions in heavy ion collisions at AGS energies: An experimental overview, 18:27831 (R;US)
Bioremediation of soils, sludges, and materials contaminated with toxic metals or radionuclides, 18:25681 (R;US)
BNL volume H^- sources, 18:27043 (R;US)
Broadband impedance of azimuthally symmetric devices in RHIC, 18:26989 (R;US)
Canted magnetic moments at the Gd(0001) surface, 18:26575 (R;US)
Comparison of aperture determinations on RHIC for single particles tracked 10^6 turns and 100 particles, having randomly generated initial coordinates, tracked for 1000 turns, 18:26990 (R;US)
Confinement and stability of a Crystal Beam, 18:26987 (R;US)
Crystallographic and metallurgical characterization of radiation detector grade cadmium telluride materials, 18:27171 (R;US)
Desorption measurements of copper and copper alloys for PEP-II, 18:27155 (R;US)
Development of distributed ion pumps for g-2 beam vacuum system, 18:27153 (R;US)
Development of guidelines to review advanced human-system interfaces, 18:26251 (R;US)
Disposal Unit Source Term (DUST) data input guide, 18:27435 (R;US)
Doubly strange hypernuclei, 18:27812 (R;US)
Dynamic soil pressures on rigid cylindrical vaults, 18:25850 (R;US)
Early baryon and meson spectroscopy culminating in the discovery of the Omega minus SU(3) and quarks, 18:27768 (R;US)
Evaluation of an x-ray fluorimeter for measuring lead in paint, 18:27170 (R;US)
Fifteenth combustion research conference, 18:26884 (R;US)
Generation of neutronic thermal data in support of space nuclear propulsion, 18:26202 (R;US)
Greenland Sea observations, 18:27474 (R;US)
Human Factors Engineering Review Model for advanced nuclear power reactors, 18:26344 (R;US)
In situ studies of passive film chemistry using x-ray absorption spectroscopy, 18:26571 (R;US)
Instability due to a two recirculation pump trip in a BWR using RAMONA-4B computer code with 3D neutron kinetics, 18:26117 (R;US)
Local environment about O atoms in Pr-Y-Ba-Cu-O films studied by O K-edge XAFS, 18:27907 (R;US)
Longitudinal impedance and stability thresholds of the AGS Booster, 18:26986 (R;US)
Magnetic effects in anomalous dispersion, 18:27908 (R;US)
Materials irradiation subpanel report to BESAC neutron sources and research panel, 18:26279 (R;US)
MCNP benchmark analyses of critical experiments for the Space Nuclear Thermal Propulsion program, 18:26205 (R;US)
Measurement of the spin of a particle using undulator radiation, 18:26984 (R;US)
Meson interferometry in relativistic heavy ion collisions, 18:27832 (R;US)
Monitoring and trace detection of hazardous waste and toxic chemicals using resonance Raman spectroscopy, 18:26835 (R;US)
New York MARKAL: An evaluation of carbon dioxide emission control strategies in New York State, 18:27272 (R;US)
Nuclear fusion of protons with ions of boron, 18:26988 (R;US)
Nuclear fusion of protons with ions of boron, 18:28030 (R;US)
Nuclear Thermal Propulsion engine based on Particle Bed Reactor using light water steam as a propellant, 18:26204 (R;US)
On the high intensity aspects of AGS Booster proton operation, 18:27039 (R;US)
Operation of the Brookhaven AGS with the Booster, 18:26963 (R;US)
Passive oxide films on well-defined nickel surfaces: An examination of film growth on Ni(100) with ex situ scanning tunneling microscopy, 18:26570 (R;US)
PHENIX Conceptual Design Report: An experiment to be performed at the Brookhaven National Laboratory Relativistic Heavy Ion Collider, 18:27745 (R;US)
Physics at the AGS with a relativistic cascade, 18:27833 (R;US)
Polarization and color transparency, 18:27767 (R;US)

Potential transients, transmission and electrochemical corrosion detection, 18:26573 (R;US)
Preliminary studies on a magneto-optical procedure for aligning RHIC magnets, 18:27042 (R;US)
Purpose of the trip was to hold discussions with several institutions in Russia on their prospective collaboration with the PHENIX experiment at the BNL Relativistic Heavy Ion Collider (RHIC): Foreign trip report, March 29, 1992–April 4, 1992, 18:27834 (R;US)
Randomized unannounced inspections at any time, 18:28094 (R;US)
Resonances in the ΣNN system, 18:27791 (R;US)
Results from the AGS Booster transverse damper, 18:27041 (R;US)
Ring diagnostics and consistency test of the model for the AGS Booster, 18:27040 (R;US)
Safety aspects of forced flow cooldown transients in Modular High Temperature Gas-Cooled Reactors, 18:26364 (R;US)
Sensitivity analysis and benchmarking of the BLT low-level waste source term code, 18:25732 (R;US)
Software development with two port calibration techniques for RHIC impedance measurements, 18:26991 (R;US)
Space reactor fuel element testing in upgraded TREAT, 18:26206 (R;US)
Spin polarized photoemission studies of interfacial and thin film magnetism, 18:26574 (R;US)
Status of nuclear safety R&D in the US, 18:26342 (R;US)
Strange particle nuclear physics: Workshop summary, 18:27811 (R;US)
Stripping efficiencies for 277 MeV/amu gold beam on copper foils, 18:27886 (R;US)
Summary of the η-meson sessions, 18:27801 (R;US)
Summing up: The physics of NCT, 18:27521 (R;US)
The application of infrared synchrotron radiation to the study of interfacial vibrational modes, 18:26856 (R;US)
The development and evaluation of guidelines for the review of advanced human-system interfaces, 18:26250 (R;US)
The E2 N→Δ transition from polarized Compton scattering, 18:27766 (R;US)
Theoretical status of J/ψ suppression, 18:27769 (R;US)
Time domain solutions for a coasting beam with impedance feedback, 18:26985 (R;US)
Travel to England for meeting on Global Environmental Change: Foreign trip report, June 2, 1992–June 6, 1992, 18:27274 (R;US)
Two-phase flow instability and dryout in parallel channels in natural circulation, 18:26919 (R;US)
Ultra-soft x-ray absorption spectroscopy: A bulk and surface probe of materials, 18:26836 (R;US)
US Department of Energy interim mixed waste inventory report: Waste streams, treatment capacities and technologies: Volume 5, Site specific-Tennessee through Washington, 18:25693 (R;US)
Wake-field and space charge effects on high brightness beams calculations and measured results for the laser driven photoelectrons at BNL-ATF, 18:26993 (R;US)
Wiggler as spin rotators for RHIC, 18:26983 (R;US)
[Greenhouse gases and national energy options]: Foreign travel trip report, October 24–November 4, 1992, 18:27275 (R;US)
[Participation in United Nations environmental projects]: Foreign trip report, September 9–14, 1992, 18:27384 (R;US)
[Travel to Russia to define research needs to improve description of cloud processes influencing atmospheric transport and transformation of pollutants]: Foreign trip report, September 28–October 5, 1991, 18:27273 (R;US)

Brown Univ., Providence, RI (United States). Div. of Engineering
Characterization of porosity via secondary reactions: Quarterly technical progress report, 1 January 1993–31 March 1993, 18:26791 (R;US)
Reactivity of young chars via energetic distribution measurements: Quarterly technical progress report, 15 March 1992–30 June 1992, 18:25534 (R;US)
Reactivity of young chars via energetic distribution measurements: Quarterly technical progress report, 1 July 1992–30 September 1992, 18:25535 (R;US)

Automatization of the neutron activation analysis method in the nuclear analysis laboratory, 18:26837 (R;CU;In Spanish)

INTERA, Inc., Las Vegas, NV (United States)
A comparative application of the Repository Integration Program (RIP) to Total System Performance Assessment, 1991, 18:25698 (R;US)

International Atomic Energy Agency, Vienna (Austria)
A modular implementation of G2 on a solvent extraction process, 18:25711 (RA;XA)
A personal computer program for emergency operating procedures support, 18:26260 (RA;XA)
A simple fission gas release/gaseous swelling model, 18:26149 (RA;XA)
A situation related, mnemonic tool for expert tasks, 18:26261 (RA;XA)
Agricultural production - Phase 2. Indonesia. Sources and sinks of nitrogen-E phosphorus-based nutrients in cropping systems: Technical report. Report prepared for the Government of the Republic of Indonesia, 18:27588 (R;XA)
An approach to modelling fuel behaviour using data from some international high burnup fuel programmes, 18:26150 (RA;XA)
Application of isotopes and radiation to increasing agricultural production - Phase 2. Indonesia. Project findings and recommendations: Terminal report. Report prepared for the Government of the Republic of Indonesia, 18:27589 (R;XA)

Behaviour of endosulfan in a model rice-fish ecosystem, 18:27542 (RA;XA)
Decision aid software development for nuclear reactors, 18:26115 (RA;XA)
Distribution and effect of ^{14}C-endosulfan in a rice paddy-fish microecosystem, 18:27545 (RA;XA)
ERB - Graphic knowledge base editor, 18:26259 (RA;XA)
Evaluation of measured high burnup fuel temperature at Riso project phase 3, 18:26148 (RA;XA)
Experimental assessment of a temperature threshold for thermally induced fission gas release in transient tested water reactor fuel with extended burnup, 18:26136 (RA;XA)
Experimental techniques and results related to high burn-up investigations at the OECD Halden Reactor Project, 18:26141 (RA;XA)
Expert system application and neural network development for nuclear safety improvement, 18:26257 (RA;XA)
Fate of chlorpyrifos in a model rice-fish ecosystem, 18:27548 (RA;XA)
Fate of endosulfan in a rice-fish ecosystem, 18:27543 (RA;XA)
Fate of trypanocidal drugs in cattle (chemotherapy of trypanosomiasis). Kenya: Terminal report. Report prepared for the Government of Kenya, 18:27590 (R;XA)
FBOLES: An expert system for fault diagnoses of nuclear power plants, 18:26258 (RA;XA)
FGR model improvement for high burnup fuel analysis, 18:26147 (RA;XA)
Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992, 18:26246 (R;XA)
Fission gas release and fuel temperature during power transients in water reactor fuel at extended burnup, 18:26134 (RA;XA)
Fission gas release behavior of high burnup fuels during power ramp tests, 18:26247 (RA;XA)
Fission gas release below 20 kWm^{-1} in transient tested water reactor fuel at extended burnup, 18:26135 (RA;XA)
Fission gas release enhancement at extended burnup: Experimental evidence from French PWR irradiation, 18:26138 (RA;XA)
Fission gas release from high burnup PWR fuels under transient conditions, 18:26139 (RA;XA)
Fission gas release of high burnup fuel, 18:26137 (RA;XA)
Fission product behaviour and fuel rod chemistry at extended burnup: Results, models and programmes of analytical experiments carried out at the CEA, Grenoble, 18:26140 (RA;XA)
Fission-gas release in fuel performing to extended burnups in Ontario Hydro nuclear generating stations, 18:26168 (RA;XA)
Fission-product release kinetics from CANDU and LWR fuel during high-temperature steam oxidation experiments, 18:26169 (RA;XA)
FP gas release behaviour of high burn-up MOX fuels for thermal reactors, 18:25640 (RA;XA)
Fuel performance modeling of high burnup fuel, 18:26151 (RA;XA)
Generic intervention levels for protecting the public in the event of a nuclear accident or radiological emergency: Interim report for comment, 18:27612 (R;XA)
Guidelines for IAEA International Regulatory Review Teams (IRRTs), 18:28216 (R;XA)
Hot cell fission gas release studies on UO_2, 18:26145 (RA;XA)
Impact of systematic stoichiometry differences among BWR rods on fission gas release, 18:26121 (RA;XA)
Improvement of ELESIM CANDU fuel performance analysis code: Fission product gas release, fuel densification and neutron flux depression, 18:26171 (RA;XA)
Intergranular fission gas bubbles and solid precipitates in UO_2 irradiated at high burnup in various conditions, 18:26146 (RA;XA)
Metabolism of ^{14}C-endosulfan in carp (Cyprinus carpio L)., 18:27546 (RA;XA)
Methodology of in-pile experiments including experimental studies of WWER-1000 refabricated fuels at the MIR research reactor, 18:26143 (RA;XA)
Modeling CANDU-type fuel behaviour during extended burnup irradiations using a revised version of the ELESIM code, 18:26172 (RA;XA)
Nuclear and conventional baseload electricity generation cost experience, 18:26446 (R;XA)
Nuclear safety. Romania. Defective fuel performance evaluation: Technical report. Report prepared for the Government of Romania, 18:26173 (R;XA)
Research on fate of fenitrothion in a rice/fish/azolla ecosystem, 18:27549 (RA;XA)
Residues of ^{14}C-endosulfan in plant, soil, and water of a rice ecosystem, 18:27544 (RA;XA)
Residues of ^{14}C-fenitrothion in a model paddy-fish ecosystem, 18:27550 (RA;XA)
Residues of monocrotophos in a simulated model system, 18:27547 (RA;XA)
Review of Studsvik's international fuel R and D projects, 18:26142 (RA;XA)
Rim effect observations from the Third Riso Fission Gas Project, 18:26122 (RA;XA)
ROMADIS - A rotating machinery diagnosis system, 18:26232 (RA;XA)
Some experimental results of investigations on the nuclide composition and burnup fraction of WWER-1000 standard fuel, 18:26144 (RA;XA)
Study on residues of ^{14}C-Fenitrothion in a model rice-fish ecosystem and in a field rice-fish ecosystem, 18:27551 (RA;XA)
The effect of fuel pellet variants on fission gas release following power ramps, 18:26120 (RA;XA)
The energy dilemma, 18:26445 (RA;XA)
The potential of knowledge based systems in nuclear installations: Report of a specialists' meeting/workshop held in Erlangen, Germany, 21-25 September 1992, 18:26256 (R;XA)
The role of neural networks in nuclear power plant safety systems, 18:26116 (RA;XA)
Thermal conductivity and gas release from SIMFUEL, 18:26170 (RA;XA)

International Centre for Theoretical Physics, Trieste (Italy)

1992 Trieste lectures on topological gauge theory and Yang-Mills theory, 18:27736 (R;XA)
2D supergravity and its connection to integrable models, 18:27755 (R;XA)
A general solution of the BV-master equation and BRST field theories, 18:27735 (R;XA)

Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland)

A review of the seismotectonics of Finland, 18:27472 (R;FI)

Actinides and beta emitters in the process water and ion exchange resin samples from the Loviisa power plant, 18:26162 (R;FI)

Application of the continuously-yielding joint model for studying disposal of high-level nuclear waste in crystalline rock, 18:25844 (R;FI)

Final disposal of spent fuel in the Finnish bedrock: Technical plans and safety assessment, 18:25839 (R;FI;In Finnish)

Final disposal of spent nuclear fuel in the Finnish bedrock: Preliminary site investigations, 18:25840 (R;FI;In Finnish)

Hydraulic fracturing rock stress measurement at Haestholmen, Finland, 18:25838 (R;FI)

Long term corrosion tests of OFHC-coppers in simulated repository conditions: Final report, 18:25843 (R;FI)

Long-term durability experiments with concrete-based waste packages in simulated repository conditions, 18:25841 (R;FI)

Microearthquakes in the Baltic shield: Seismotectonic analysis for nuclear power plant in the Loviisa area, South-eastern Finland, 18:26397 (R;FI)

Modelling of water-rock interaction at TVO investigation sites: Summary report, 18:27512 (R;FI)

Review of the sorption of radionuclides on the bedrock of Haestholmen and on construction and backfill materials of a final repository for reactor wastes, 18:27471 (R;FI)

Saline groundwater in crystalline bedrock: A literature survey, 18:27511 (R;FI)

SIMFUEL dissolution studies in granitic groundwater leaching experiments at VTT, 18:25836 (R;FI)
Sorption of uranium on rocks in anaerobic groundwater, 18:25837 (R;FI)
The dissolution of unirradiated UO_2 fuel pellets under simulated disposal conditions, 18:25842 (R;FI)
TVO-Flowmeter, 18:27513 (R;FI)

O

Oak Ridge K-25 Site, TN (United States)
Electroosmotic decontamination of concrete, 18:25722 (R;US)
Multiphoton ionization studies of WF_6 and UF_6, 18:27894 (R;US)
Standards on computers in document processing and related communication: Foreign trip report, November 13–23, 1992, 18:28166 (R;US)

Oak Ridge National Lab., TN (United States)
1990 Nationwide Truck Activity and Commodity Survey selected tabulations: Summary report, 18:26520 (R;US)
A natural language generation system for a heterogeneous distributed database system, 18:28176 (RA;US)
A preliminary engineering assessment of the ITER CDA ECH launcher, 18:28034 (R;US)
A reexamination of grain boundary fracture in Ni_3Al: Environmental and alloying effects, 18:26599 (R;US)
A self-learning Bayesian Expert System, 18:27529 (RA;US)
Acidification of freshwater ecosystems: Foreign trip report, September 25–October 19, 1992, 18:27356 (R;US)
Active density control in DIII-D H-mode plasmas, 18:27993 (R;US)
Active probing of plasma edge turbulence and feedback studies on the Texas Experimental Tokamak (TEXT), 18:27947 (R;US)
Addressing the susceptibility of digital systems to electromagnetic interference, 18:26254 (R;US)
An application of rough sets in knowledge synthesis, 18:28182 (RA;US)
An inventory of wells of Oak Ridge National Laboratory 1992, 18:27449 (R;US)
An optical technique for characterizing the liquid phase of steam at the exhaust of an LP turbine, 18:26092 (R;US)
Analysis of anomalous data produced by Harshaw Model 8801 thermoluminescent dosimeter cards, 18:27205 (R;US)
Annual report on the Background Soil Characterization Project on the Oak Ridge Reservation, Oak Ridge, Tennessee: Results of Phase 1 investigation, 18:27398 (R;US)
Application of Z-contrast imaging to obtain column-by-column spectroscopic analysis of materials, 18:26838 (R;US)
Approximate methods for derivation of covariance data, 18:27827 (R;US)
Auxiliary feedwater system aging study, 18:26347 (R;US)
Belted kingfishers as ecological monitors of contamination: A review, 18:27501 (R;US)
Biological markers and indicators of marine ecosystem health: Foreign trip report, November 21–28, 1992, 18:27500 (R;US)
Broadcasting on linear arrays and meshes, 18:28174 (R;US)
Calculation of the thermopower of Ni-P amorphous alloys, 18:26588 (R;US)
Chemical and displacement atomic pair correlations in crystalline solid solutions recovered by anomalous x-ray scattering in Fe-Ni alloys, 18:26586 (R;US)
Chemical vapor deposition of Ta_2O_5 corrosion resistant coatings, 18:26738 (R;US)
Comparison of three field screening techniques for delineating petroleum hydrocarbon plumes in groundwater at a site in the southern Carson Desert, Nevada, 18:27447 (R;US)
Competence-switching managed by intelligent systems, 18:27530 (RA;US)
Corrosion kinetics and mechanisms for nuclear grade graphites, 18:26779 (R;US)
Covariance matrix of model parameters and uncertainties of calculated neutron cross sections on ^{19}F, 18:27837 (R;US)
Crystallization of grain boundary phases in silicon nitride with low additive contents by microwave annealing, 18:26746 (R;US)
Current distribution tomography for determination of internal current density distributions, 18:27652 (R;US)
Decentralized control of uncertain systems via sensitivity models, 18:28134 (R;US)
Deformation studies in the extremely neutron-deficient praseodymium, neodymium and promethium isotopes, 18:27813 (R;US)
Design of a cruciform bend specimen for determination of out-of-plane biaxial tensile stress effects on fracture toughness for shallow cracks, 18:26598 (R;US)
Development and application of the automated Monte Carlo biasing procedure in SAS4, 18:27866 (R;US)
Development and commercialization status of Fe_3Al-based intermetallic alloys, 18:26600 (R;US)
Development and testing of ion exchangers for treatment of liquid wastes at Oak Ridge National Laboratory, 18:25739 (R;US)
Development of a constitutive model for creep and life prediction of advanced silicon nitride ceramics, 18:26744 (R;US)
Development of a zirconia-mullite based ceramic for recuperator applications: DOE/ORNL Ceramic Technology Project, 18:26533 (R;US)
Dynamical Ising model simulations of nucleation and growth in copper-cobalt alloys, 18:26589 (R;US)
Effects of alloying and temperature on the high-temperature oxidation of Cr-Cr_2Nb, 18:26596 (R;US)
Effects of depositon rate on $Bi_2Sr_2CaCu_2O_{8+x}$ and $Bi_2Sr_{1.6}La_{0.4}CuO_{6+x}$ epitaxial thin film growth by pulsed-laser ablation, 18:26747 (R;US)
Electric-utility DSM-program costs and effects, 1991 to 2001, 18:26554 (R;US)
Environmental contamination in Central and Eastern Europe: Foreign trip report, October 10–17, 1992, 18:27443 (R;US)
Environmental effects on iron aluminides, 18:26597 (R;US)
Environmental embrittlement in ordered intermetallic alloys, 18:26593 (R;US)
Environmental Restoration Program pollution prevention performance measures for FY 1993 and 1994 remedial investigations, 18:25865 (R;US)
Equilibrium reconstruction of the q-profile in tokamaks from motional Stark effect data, 18:27948 (R;US)
Evaluation of the utility and energy monitoring and control system installed at the US Army, Europe, 409th Base Support Battalion, Military Community at Grafenwoehr, Germany, 18:26497 (R;US)
Evolving surface cusps during strained-layer epitaxy, 18:26595 (R;US)
Executive conference on energy technology policy for sustainable development: Comparing long-term approaches: Foreign trip report, December 6–17, 1991, 18:26412 (R;US)
Experimental investigations of superconductivity in quasi-two-dimensional epitaxial copper oxide superlattices and trilayers, 18:27931 (R;US)
Extraction of a alkali metal cations using a lipophilic lariat ether having a c-pivot carboxylic acid sidearm, 18:26840 (R;US)
Eye-gaze and intent: Application in 3D interface control, 18:28135 (R;US)
Fast-ICCD photography and gated photon counting measurements of blackbody emission from particulates generated in the KrF-laser ablation of BN and YBCO, 18:26739 (R;US)
Final irradiation report for the HFR-B1 experiment and postirradiation examinations for HFR-B1: Foreign trip report, October 12–December 30, 1991, 18:26276 (R;US)
Folded waveguide designs for tokamaks, 18:28033 (R;US)
Forest management for fixing and sequestering carbon, 18:27315 (R;US)
Formalization of an ontology of ceramic science in Classic, 18:26766 (RA;US)
Full scale dynamic fracture testing of degraded pipe, 18:26280 (R;US)
General order characteristic methods for solving neutron transport problems, 18:27865 (R;US)
High spin states in neutron rich nuclei from spontaneous fission, 18:27836 (R;US)
High-resolution Z-contrast imaging and hole concentration mapping of YBCO thin films, 18:26748 (R;US)

Hybrid pattern recognition system capable of self-modification, 18:28133 (R;US)
Identification and assessment of BWR in-vessel severe accident mitigation strategies, 18:26348 (R;US)
Implications in vivid logic, 18:28175 (RA;US)
In situ grouting of low-level burial trenches with a cement-based grout at Oak Ridge National Laboratory, 18:25737 (R;US)
Insights into semiconducting materials and growth phenomena through Z-contrast STEM, 18:26781 (R;US)
Integrating Natural Resource Damage Assessment and environmental restoration activities at DOE facilities, 18:26421 (R;US)
Investigation of the organic matter in inactive nuclear tank liquids: Environmental Restoration Program, 18:25734 (R;US)
Investigations of low-temperature neutron embrittlement of ferritic steels, 18:26587 (R;US)
Ion cyclotron heating experiments and plans for the Advanced Toroidal Facility (ATF), 18:27945 (R;US)
Kinetics of photodeposition of superconducting films, 18:26741 (R;US)
Large-scale thermal-shock experiments with clad and unclad steel cylinders, 18:26127 (R;US)
Lattice site of helium implanted in Si and diamond, 18:26776 (R;US)
Linguistic tools for intelligent systems, 18:28181 (RA;US)
Literature review: Heat transfer through two-phase insulation systems consisting of powders in a continuous gas phase, 18:26502 (R;US)
Low-spin identical bands in rare earth nuclei, 18:27814 (R;US)
Management plan for the Oak Ridge Reservation Hydrology and Geology Study Groundwater Data Base, 18:27446 (R;US)
Materials and design bases issues in ASME Code Case N-47, 18:26216 (R;US)
Measurements with an unreflected uranium (93.2%) metal sphere, 18:25636 (R;US)
Modeling the thermal conductivity of fiber-reinforced ceramic composites, 18:26778 (R;US)
Modular High-Temperature Gas-Cooled Reactor COMEDIE Fission Product Transport Program: Foreign trip report, October 11–20, 1991, 18:26275 (R;US)
Monitoring and evaluation of the Guatemalan Mission's natural resources strategic objective: Foreign trip report, September 13–30, 1992, 18:27442 (R;US)
Multiaxial deformation and life prediction model and experimental data for advanced silicon nitride ceramics, 18:26745 (R;US)
Multiphoton ionization studies of WF_6 and UF_6, 18:27894 (R;US)
Multivariate discretization of continuous attributes for machine learning, 18:28180 (RA;US)
Negative ion formation in small carbon clusters, 18:26780 (R;US)
Nextel™/SiC composites fabricated using forced chemical vapor infiltration, 18:26783 (R;US)
Nonlinear gyrofluid models of shear Alfven instabilities in ignited and beam heated toroidal plasmas, 18:27946 (R;US)
Ocean uptake of carbon dioxide, 18:27477 (R;US)
Off-site contamination at Oak Ridge National Laboratory, 18:25851 (R;US)
On the potential for a CO_2 fertilization effect in forest trees: An assessment of 58 controlled-exposure studies and estimates of the biotic growth factor, 18:27385 (R;US)
Optical and infrared spectra of thermally annealed Pb implanted SiO_2 glasses, 18:26774 (R;US)
Overview of chemical vapor infiltration, 18:26782 (R;US)
Parallelization of a spherical S_N algorithm based on the spatial domain decomposition, 18:28096 (R;US)
Perennial species for optimum production of herbaceous biomass in the Piedmont (Management study, 1987–1991): Final report, 18:25944 (R;US)
Pipe break testing of primary loop piping similar to Department of Energy's New Production Reactor-Heavy Water Reactor: Final report, 18:26373 (R;US)
Purity and danger: Protection of Native American religious sites and knowledge in federal development, 18:26414 (R;US)
Qualification issues for advanced light-water reactor protection systems, 18:26253 (R;US)
Radioisotope production at Oak Ridge National Laboratory–past, present, and future, 18:25904 (R;US)
RApid Screening of Hazard analysis, 18:27646 (R;US)
Rare attributes in finite universe: Hypotheses testing specification and exact randomized upper confidence bounds, 18:28173 (R;US)
Recent advances in ordered intermetallics, 18:26594 (R;US)
Removal of uranium by biosorption, 18:27475 (R;US)
Rheology and microstructure of concentrated zirconia-alumina suspensions for gelcasting composites, 18:26743 (R;US)
Risk implications of approaches to setting soil remediation goals, 18:27386 (R;US)
Selective leaching of uranium from uranium-contaminated soils: Progress report 1, 18:27448 (R;US)
Simulation of barrier heterogeneity and preferential flow effects on the performance of shallow land burial facilities, 18:25738 (R;US)
Strategy acquisition by an artificial neural network: Experiments in learning to play a stochastic game, 18:28177 (RA;US)
Structural investigation of electrochemically etched silicon, 18:26777 (R;US)
Switchover software reliability estimate for Paducah Freezer/Sublimer computer systems, 18:25632 (R;US)
Synergism in the extraction of Cu(II) by polydentate thia ligands combined with didodecylnaphthalene sulfonic acid, 18:26839 (R;US)
Technical basis for acceptance criteria on the susceptibility of digital systems to electromagnetic interference, 18:26252 (R;US)
Testing and surveillance of corrosion for the steam generator (SG) materials of the New Production-Modular High-Temperature Gas-cooled Reactor program: Foreign trip report, August 31–September 5, 1992, 18:26167 (R;US)
The application of GIS and remote sensing technologies for site characterization and environmental assessment, 18:27388 (R;US)
The collaborative US/Japanese irradiation-effects investigations on material that has been removed from the pressure vessel of the Japanese Power Demonstration Reactor (JPDR): Foreign trip report, May 17–23, 1992, 18:26244 (R;US)
The corrosion behavior of 8001 Al under heat-transfer conditions in an aqueous loop system, 18:26714 (R;US)
The effect of aging at 343°C on the mechanical properties and microstructure of type 308 stainless steel weldments, 18:26591 (R;US)
The effect of irradiation on the mechanical properties of 6061-T651 aluminum, 18:26585 (R;US)
The effect of long-term aging on the impact properties of modified 9Cr-1Mo steel, 18:26590 (R;US)
The impact of using reduced capacity baskets on cask fleet size and cask fleet mix, 18:25653 (R;US)
The influence of microstructure on the mechanical behavior of silicon nitride ceramics, 18:26742 (R;US)
The influence of thermal aging on the microstructure and fatigue properties of modified 9Cr-1Mo steel, 18:26592 (R;US)
Thin Ni silicide formation by low temperature-induced metal atom reaction with ion implanted amorphous silicon, 18:26740 (R;US)
Trace contaminant determination in fish scale by laser ablation technique, 18:27476 (R;US)
Travel to attend a meeting in Austria to discuss issues related to criticality safety and overpacks in the transport of radioactive material: Foreign trip report, August 30–September 5, 1992, 18:26904 (R;US)
Travel to attend symposium on swift heavy ions in matter, a conference on electrostatic accelerators and associated boosters and a conference on applications of nuclear techniques: Foreign trip report, May 16–June 21, 1992, 18:27091 (R;US)
Travel to collect data on boiling water reactor (BWR) instability events in Sweden and Spain: Trip report, May 4–14, 1992, 18:26372 (R;US)
Travel to England and the Netherlands for a performance evaluation of scanning and electron microscopes equipped with field emission guns: Foreign trip report, April 27–May 5, 1993, 18:27220 (R;US)
Travel to France for a large experiment at the GANIL accelerator facility: Foreign trip report, June 10–24, 1992, 18:27092 (R;US)

Travel to Germany for conference on nuclei far from stability and conference on atomic masses and fundamental constants: Foreign trip report, July 18–26, 1992, 18:27826 (R;US)
Travel to Germany to attend the international conference on defects in insulating materials: Foreign trip report, August 14–31, 1992, 18:26765 (R;US)
Travel to Germany to work on off-site assignment at the Clinic for Nuclear Medicine at the University of Bonn, Germany, for a one-year period through support as a Senior American Scientist of the Alexander von Humboldt Foundation of Germany: Foreign trip report, June 10, 1991–June 4, 1992, 18:27528 (R;US)
Travel to Grenoble, France, to attend and present two papers at the 1992 IEEE international conference on robotics and automation, and to visit three French robotics research laboratories (INRIA, LAAS, and LIFIA): Foreign trip report, May 8–24, 1992, 18:26903 (R;US)
Travel to Japan for a performance evaluation of the Hitachi HF2000 cold field emission gun analytical electron microscope: Foreign trip report, May 16–22, 1993, 18:27221 (R;US)
Travel to Japan to participate in the international seminar on high-resolution STEM: Foreign trip report, June 9–16, 1992, 18:26851 (R;US)
Travel to London, England, to attend the sixth international conference on road traffic monitoring and control and to visit traffic control centers in Greater London area to assess their capabilities and operations: Foreign trip report, March 20, 1992–May 1, 1992, 18:26519 (R;US)
Travel to Luso, Portugal, to participate in the NATO Advanced research workshop on the use of biomarkers to assess human health and environmental impacts from exposure to chemical pollutants: Foreign trip report, May 30, 1992–June 9, 1992, 18:27650 (R;US)
Travel to The Netherlands for activities of the International Energy Agency's Heat Pump Centre: Foreign trip report, October 11–19, 1991, 18:26532 (R;US)
Travel to the Netherlands to participate in a workshop held by the World Inventory of Soil Emissions (WISE) project at the International Soil Reference and Information Centre (ISRIC): Foreign trip report, August 22–29, 1992, 18:27439 (R;US)
Travel to the United Kingdom and Italy to present keynote lectures and technical talks at two international meetings on the role of natural organic matter in the environment and to learn about recent advances in this area relevant to the traveler's research: Foreign trip report, September 10–26, 1992, 18:27440 (R;US)
Treatment of waste by the Molten Salt Oxidation process at the Oak Ridge National Laboratory, 18:25683 (R;US)
Utilization of the case-based reasoning method to resolve dynamic problems, 18:28179 (RA;US)
Viewpoints and selective inheritance in object-oriented modeling, 18:28178 (RA;US)
Waste management plan for the remedial investigation/feasibility study of Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee: Environmental Restoratin Program, 18:25735 (R;US)
[Environmental impact analyses on current and planned Antarctic operations and research activities]: Foreign trip report, October 19–November 20, 1992, 18:27444 (R;US)
[Life Management of Nuclear Power Plants]: Foreign trip report, February 15–22, 1992, 18:26243 (R;US)
[Rothamsted model for turnover of soil organic matter]: Foreign trip report, October 7–9, 1992, 18:27441 (R;US)
[Transportation/geologic repository interface requirements for high level radioactive waste and spent nuclear fuel]: Foreign trip report, November 7–24, 1992, 18:25736 (R;US)
[Travel to Bermuda to participate in the North Atlantic Treaty Organization (NATO) advanced research workshop on biogeochemical ocean-atmosphere transfers]: Foreign trip report, January 26–31, 1992, 18:27499 (R;US)
[Travel to Japan for collaborative research on DNA repair]: Foreign trip report, September 17–December 30, 1991, 18:27518 (R;US)
[Travel to Japan to attend the fifth international symposium on advanced nuclear energy research and to visit the new research reactor JRR-3M]: Foreign trip report, March 9–12, 1993, 18:25920 (R;US)
[Travel to US field stations in Antarctica in preparation for environmental impact studies]: Foreign trip report, January 4–February 22, 1993, 18:27445 (R;US)

Oak Ridge Y-12 Plant, TN (United States)
Large-scale testing of structural clay tile infilled frames, 18:26828 (R;US)
Phase 2 Sampling Plan for Chestnut Ridge Operable Unit 2 (Filled Coal Ash Pond/Upper McCoy Branch) at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee: Environment Restoration Program, 18:25696 (R;US)
RCRA closure plan for the Bear Creek Burial Grounds B Area and Walk- In Pits at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee, 18:25695 (R;US)

Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria)
Decontamination strategies in case of satellite crash, 18:27355 (R;AT;In German)
International Atomic Energy Agency co-ordinated research programme 'the safety assessment of near-surface radioactive waste disposal facilities (NSARS)', 18:27498 (R;AT)
Investigations on commercial semiconductor diodes as possible high dose rate radiation detectors, 18:27204 (R;AT;In German)
Lymphocytic subsets and low-dose exposure, 18:27630 (R;AT;In German)
Preliminary experiments for determining Kd values for cesium and strontium as part of site selection. Pt. 2: Experiments with clay materials, 18:26811 (R;AT;In German)
Preliminary experiments for measuring Kd values for cesium and strontium. To be used in site evaluations, 18:26810 (R;AT;In German)
Qualitative comparison of the so-called biotransfer model, 18:25846 (R;AT;In German)
Radiation surveyance actions following large-area contamination, 18:27437 (R;AT;In German)
Response of soil aggregate stability to storage time of soil samples, 18:25919 (R;AT;In German)
Sense and purpose of radiation protection training, 18:27629 (R;AT;In German)
The lysimeter device of the Austrian Research Centre Seibersdorf, 18:27436 (R;AT;In German)
The soil-to-plant transfer of radionuclides. Feasibilities and limits of the transfer concept, 18:27438 (R;AT;In German)
Transbios - a unified model for assessment of the effect of noxious materials in ground water to the biosphere. Compilation of the model, 18:25847 (R;AT;In German)

Officine Galileo SpA, Florence (Italy)
Environmental conservation by radiation technology: New Italian multi-purpose demonstration centre, 18:27046 (R;IT)

Ohio Coal Development Office, Columbus, OH (United States)
Ammonia regeneration for a combined lime/ammonia spray dryer for SO_2 control: Final report, 18:25554 (R;US)
Catalytic reduction of SO_x-NO_x in coal flue gas: Phase 1 report, 18:26109 (R;US)
Catalytic reduction of SO_x-NO_x in coal flue gas: Supplement to the final report, 18:26110 (R;US)
Design and development of a novel gas desulfurization process using hollow fiber membranes to stimulate the utilization of high sulfur Ohio coal: Final report, 18:25555 (R;US)

Ohio State Univ. Research Foundation, Columbus, OH (United States)
Synthesis and evaluation of boron compounds for neutron capture therapy of malignant brain tumors: Technical progress report No. 1, May 1, 1990–January 31, 1991, 18:27522 (R;US)

Ohio State Univ. Research Foundation, Columbus, OH (United States). Dept. of Welding Engineering
[Investigation of ultrasonic wave interaction with porous saturated rocks], 18:27662 (R;US)

Ohio State Univ., Columbus, OH (United States)
Photosynthetic electron transport in genetically altered chloroplasts: Progress report, June 15, 1992–June 15, 1993, 18:25997 (R;US)

Ohio State Univ., Columbus, OH (United States). Dept. of Microbiology
Structure and regulation of an archaebacterial promoter: An in vivo study: Progress report, August 1, 1991–March 31, 1993, 18:27516 (R;US)

Ohio Univ., Athens, OH (United States)
Electronic states in systems of reduced dimensionality: Progress report, October 15, 1992–October 14, 1993, 18:27898 (R;US)

Oklahoma State Univ., Stillwater, OK (United States)
Synthesis of 6-Methyl-9-n-propyldibenzothiophene-4-ol: Quarterly technical progress report No. 5, July 28–October 28, 1991, 18:26865 (R;US)

Oklahoma State Univ., Stillwater, OK (United States). Dept. of Chemistry
Synthesis of 6-Methyl-9-n-propyldibenzothiophene-4-ol: Quarterly technical progress report No. 3, February 25, 1991–April 25, 1991, 18:26863 (R;US)
Synthesis of 6-Methyl-9-n-propyldibenzothiophene-4-ol: Quarterly technical progress report No. 4, April 25–July 25, 1991, 18:26864 (R;US)
Synthesis of 6-Methyl-9-propyldibenzothiophene-4-ol: Quarterly technical progress report No. 1, July 25, 1990– October 25, 1990, 18:26862 (R;US)

Okresni Urad, Jihlava (Czech Republic)
Anti-radon provisions by Building Offices, 18:25903 (RA;CS;In Czech)
Conference on provisions against radon: Proceedings, 18:27332 (R;CS;In Czech, Slovak)
Contribution of the building material to the radiation burden in buildings, 18:27621 (RA;CS;In Czech)
Controlled overpressure airing as an efficient anti-radon system in existing buildings, 18:27615 (RA;CS;In Czech)
Detailed survey of buildings as a targeted system of test procedures, 18:27339 (RA;CS;In Czech)
Effect of radon on human health, 18:27614 (RA;CS;In Czech)
Evaluation of radon risk from the subsoil, 18:27335 (RA;CS;In Czech)
Existing experience with anti-radon provisions in the Jihlava district, 18:27617 (RA;CS;In Czech)
Physics underlying the searching for radon sources in houses, 18:27338 (RA;CS;In Czech)
Practical experience with the implementation of remedial actions, 18:27618 (RA;CS;In Czech)
Problems of 'START' type houses, 18:27620 (RA;CS;In Czech)
Radioactivity of rocks, 18:27427 (RA;CS;In Czech)
Radon in the interior of building structures and the sick building syndrome, 18:27340 (RA;CS;In Slovak)
Radon monitoring in general, 18:27334 (RA;CS;In Czech)

Interface configurations of $Al_xGa_{1-x}As/GaAs$ quantum wells probed by photoluminescence spectroscopy, 18:26815 (RA;US)
Interface roughness and x-ray reflectivity, 18:27927 (RA;US)
Introduction, 18:26374 (RA;US)
Ionospheric effects on a wide-bandwidth, polarimetric, space-based, synthetic-aperture radar, 18:27723 (R;US)
Isolation of a piezoresistive accelerometer used in high acceleration tests, 18:26933 (R;US)
ITS Version 3.0: The Integrated TIGER Series of coupled electron/photon Monte Carlo transport codes, 18:27878 (R;US)
JAC3D – A three-dimensional finite element computer program for the nonlinear quasi-static response of solids with the conjugate gradient method: Yucca Mountain Site Characterization Project, 18:25752 (R;US)

Large-scale brine inflow data report for room Q prior to November 25, 1991, 18:25754 (R;US)
Locally non-uniform finite-difference time domain with application to stealth, crosstalk, and narrow apertures, 18:28186 (R;US)
Making the connection between information modeling and implementation, 18:28214 (R;US)
Microstructural mechanisms that enhance electromigration resistance in Al–Cu thin films, 18:26718 (R;US)
Modeling ignition chemistry, 18:26890 (R;US)
Molten fuel-coolant interactions, 18:26378 (RA;US)
Multi-Site Project seismic verification experiment and assessment of site suitability, 18:25614 (R;US)
Multiphase equation of state for iron, 18:26717 (R;US)
Neural network hardware and software solutions for sorting of waste plastics for recycling, 18:26555 (R;US)
Non-scanned LADAR imaging and applications, 18:27228 (R;US)
NPR/FCI EXO-FITS experiment series report, 18:26382 (R;US)
Observations of broad-band micro-seisms during reservoir stimulation, 18:25597 (R;US)
Parachute system design, analysis, and simulation tool: Status report, 18:27239 (R;US)
PATRAM '92: 10th international symposium on the packaging and transportation of radioactive materials, 18:25652 (R;US)
Physics of gas breakdown for ion beam transport in gas, 18:28060 (R;US)
Portable acoustic wave sensor systems for real-time monitoring of volatile organic compounds, 18:27459 (R;US)
Predicting the vibrations of a spinning inflated membrane, 18:27724 (R;US)
Preliminary nuclear safety assessment of the NEPST (Topaz II) space reactor program, 18:26384 (R;US)
Prevention and mitigation of core debris interactions with concrete, 18:26377 (RA;US)
Problems and opportunities in microwave joining of ceramics, 18:26770 (R;US)
Progress in the Concentrator Initiative Program, 18:26027 (R;US)
Proposed guidelines for reporting performance of a solar dish/Stirling electric generation system, 18:26000 (R;US)
Quantitative STM and AFM studies of the evolution of interface roughness, 18:26907 (RA;US)
Rapid acquisition of high resolution full wave-field borehole seismic data, 18:27668 (R;US)
Rapid deployment access delay system (RAPADS), 18:27249 (R;US)
Recent advances in outdoor performance evaluation of PV systems, 18:26006 (R;US)
Refining and defining the Program Dependence Web, 18:28187 (R;US)
Revisiting the BCS, a measurement system for characterizing the optics of solar collectors, 18:26026 (R;US)
Room Q data report: Test borehole data from April 1989 through November 1991, 18:25753 (R;US)
Roughness at chemical heterointerfaces: Definition and measurement, 18:26816 (RA;US)
Sandia Access Delay Technology Program, 18:25898 (R;US)
Sidewall thermometry perturbations to nonlinear heat transport near the λ transition in ^{4}He, 18:26818 (R;US)
Simulation of orbital debris impacts on bumper shields, 18:26931 (R;US)
Solution chemistry optimization of sol-gel processed PZT thin films, 18:26769 (R;US)
Status of lost circulation research, 18:26048 (R;US)
Tactical Automated Security System (TASS), 18:25897 (R;US)
Test plan: Heated axisymmetric pillar, 18:25685 (R;US)
Test plan: Small scale seal performance tests: Test Series B, 18:26897 (R;US)
Test/analysis correlation and model updating of the STARS I & II missile systems, 18:27240 (R;US)
The effects of latex additions on centrifugally cast concrete for internal pipeline protection, 18:25608 (R;US)
The growth of $InAs_{1-x}Sb_x$/InAs strained-layer superlattices by metal-organic chemical vapor deposition, 18:26814 (R;US)
Thermal stress analyses of a header plate with a 51-PIN electrical feed-thru, 18:26947 (R;US)
Three-dimensional shock wave physics simulations with MIMD PAGOSA on massively parallel computers, 18:26906 (R;US)
US Department of Energy interim mixed waste inventory report: Waste streams, treatment capacities and technologies: Volume 5, Site specific-Tennessee through Washington, 18:25693 (R;US)
Variance reduction unique to coupled electron/photon Monte Carlo transport, 18:27877 (R;US)
Vibration suppression by modulation of elastic modulus using shape memory alloy, 18:26891 (R;US)
Waste minimization/pollution prevention at R&D facilities: Implementing the SNL/NM Process Waste Assessment Program, 18:26436 (R;US)
[Travel to Guatemala to discuss plans to incorporate renewable energy technologies into rural electrification programs]: Foreign trip report, September 16, 1992–October 7, 1992, 18:26003 (R;US)
[Travel to New Zealand for studies in electromagnetic inversion applied to the earth and its relevance to environmental remediation]: Foreign trip report, August 23–September 12, 1992, 18:27664 (R;US)
[Travel to Russia and the UK concerning mining and heat extraction technology]: Foreign trip report, September 11–24, 1992, 18:26039 (R;US)
[Travel to the UK concerning semiconductor research]: Foreign trip report, 16 July–4 August 1992, 18:26789 (R;US)

Sandia National Labs., Livermore, CA (United States)
A trip to Hungary to present a paper on bioremediation and to attend the international symposium on environmental contamination in central and eastern Europe: Foreign trip report, October 10–October 19, 1992, 18:26439 (R;US)
Process Waste Assessment, Mechanics Shop, 18:26538 (R;US)
[Travel to France to the IAEA technical committee meeting on atomic and molecular data for fusion reactor technology]: Foreign trip report, October 9–18, 1992, 18:28036 (R;US)

Savoie Univ., 73 - Chambery (France)
Determination of nucleon structure functions on the assumption of diquark presence, 18:27807 (R;FR;In French)

Science Applications International Corp., Idaho Falls, ID (United States)
Technical and regulatory review of the Rover nuclear fuel process for use on Fort St. Vrain fuel, 18:25705 (R;US)

Science Applications International Corp., Las Vegas, NV (United States)
Current plans to characterize the design basis ground motion at the Yucca Mountain, Nevada Site, 18:25682 (R;US)

Science Applications International Corp., McLean, VA (United States)
The economics of proliferation and counterproliferation: Final report, 18:26564 (R;US)
[A meeting in Belgium on solar retrofitting]: Foreign trip report, August 31–September 2, 1992, 18:26009 (R;US)

Scientific and Applied Research Center (SARC), Doha (Qatar)
Some improvement of charcoal measurement techniques used for indoor radon measurements in Qatar, 18:27341 (R;QA)

Secretariat d'Etat a la Recherche, Algiers (Algeria)
Decontamination of black pepper and red pepper by gamma radiation, 18:27591 (R;DZ;In French)
Pretreatment of industrial phosphoric acid by Algerian filter-aids, 18:26796 (R;DZ;In French)
The extraction of titanium, chromium and cadmium from phosphoric acid solutions by para (1,1,3,3 tetramethyl butyl) phenyl phosphoric acid in kerosene diluent, 18:26866 (R;DZ)

Self (William) Associates, Orinda, CA (United States)
Documentation and assessment of the history of the Lawrence Livermore National Laboratory Livermore facility, and site CA-SJO-173H, the Carnegie town site at Lawrence Livermore National Laboratory Site 300, Alameda and San Joaquin Counties, California, 18:27460 (R;US)

Senior Thermal Engineering Ltd., Wakefield (United Kingdom)
Development of a chain grate stoker for d-RDF combustion, 18:25965 (R;GB)

Service Central de Protection contre les Rayonnements Ionisants, 78 - Le Vesinet (France)
Monthly results of measurements; January 1993, 18:27368 (R;FR;In French)

Shoshone-Bannock Tribe, Fort Hall, ID (United States)
Columbia River coordinated information system report on information needs, 18:25989 (R;US)

Siemens AG Unternehmensbereich KWU, Erlangen (Germany)
Assessment of RELAP5/MOD3/V5M5 against the UPTF Test No. 11 (countercurrent flow in PWR hot leg), 18:26160 (R;US)

Skidaway Inst. of Oceanography, Savannah, GA (United States)
Biological processes in the water column of the South Atlantic Bight: Phytoplankton response: Final progress report, 18:27478 (R;US)

South Carolina Univ., Columbia, SC (United States)
Characterization of the mammalian DNA polymerase gene and protein: Annual progress report, 18:27517 (R;US)
[Workshop for coordinating South Carolina's pre-college systemic initiatives in science and mathematics], 18:28072 (R;US)

South Carolina Wildlife and Marine Resources Dept., Columbia, SC (United States)
Wildlife management assistance report: Progress report, July 1, 1991–June 30, 1992, 18:27399 (R;US)

Southern Co. Services, Inc., Birmingham, AL (United States)
Run 263 with Black Thunder Mine subbituminous coal and dispersed molybdenum catalysts: Technical progress report, 18:25533 (R;US)

Southern Electric International, Inc., Wilsonville, AL (United States)
Run 263 with Black Thunder Mine subbituminous coal and dispersed molybdenum catalysts: Technical progress report, 18:25533 (R;US)

Southern States Energy Board, Norcross, GA (United States)
Alternative routes for highway shipments of radioactive materials and lessons learned from state designations, 18:25660 (R;US)
An examination of the Hazardous Materials Transportation Uniform Safety Act (HMTUSA): A southern perspective, 18:25656 (R;US)
Lessons learned by southern states in transportation of radioactive materials, 18:25654 (R;US)
Lessons learned by southern states in designating alternative routes, 18:25663 (R;US)
Radiological transportation emergency response training course funding and timing in the southern states, 18:25657 (R;US)
Rail abandonments in the South and their effect on NWPA rail shipments, 18:25666 (R;US)
Report on state liability for radioactive materials transportation incidents: A survey of laws, 18:25669 (R;US)
Southern routes for high-level radioactive waste: Agencies, contacts, and designations, 18:25661 (R;US)
Southern state radiological emergency preparedness and response agencies, 18:27658 (R;US)
Southern state radiological emergency preparedness and response plans: A collection of matrices, 18:25852 (R;US)
Southern State Radiological Transportation Emergency Response Training Course Summary, 18:25664 (R;US)
Southern states radiological emergency response laws and regulations, 18:25853 (R;US)
Southern states radiological emergency response laws and regulations, 18:25854 (R;US)
Southern states radiological emergency response laws and regulations, 18:25659 (R;US)
Southern States' Routing Agency Report, 18:25662 (R;US)
Southern states' routing agency report, 18:25670 (R;US)
Southern States' Routing Agency Report, 18:25658 (R;US)
Spent fuel and high-level radioactive waste transportation report, 18:25665 (R;US)
Spent Fuel and High-Level Radioactive Waste Transportation Report, 18:25655 (R;US)
Spent fuel and high-level radioactive waste transportation report, 18:25668 (R;US)
State alternative route designations, 18:25899 (R;US)
The rail abandonment process: A southern perspective, 18:25667 (R;US)
Transportation infrastructure upgrades in the South: A compilation of state plans for construction near nuclear reactor sites, 18:25671 (R;US)

SRI International, Menlo Park, CA (United States)
Coal structure and behavior: Interfacial chemistry in coal, 18:25545 (R;US)
Low severity conversion of activated coal: Final report, 18:25526 (R;US)
Use of dispersed catalysts for coal liquefaction, 18:25478 (R;US)

Stanford Linear Accelerator Center, Menlo Park, CA (United States)
An historical review of lepton proton scattering, 18:27799 (R;US)
Broadband impedance of the B factory, 18:27017 (R;US)
Bunch-by-bunch feedback for PEP II, 18:27167 (R;US)
Chemical approaches to zero blowdown operation (TP93-05), 18:26973 (R;US)
Design of laser-Compton spot size monitor, 18:27093 (R;US)
Design of the detuned accelerator structure, 18:27098 (R;US)
Experience with a radio frequency gun on the SSRL Injector Linac, 18:27094 (R;US)
Nuclear dynamical diffraction using synchrotron radiation, 18:27912 (R;US)
Overview of the Scalable Coherent Interface, IEEE STD 1596 (SCI), 18:28190 (R;US)
Photoemission study of diamond (100) surface, 18:26819 (R;US)
Proposal for a feasibility study of very large aperture quadrupole magnets, 18:27097 (R;US)
Pulse modulator developments in support of klystron testing at SLAC, 18:27095 (R;US)
Requirements for linear collider instrumentation, 18:27096 (R;US)
The Final Focus Test Beam laser referene system, 18:27099 (R;US)

Stanford Univ., CA (United States)
Ecology for a changing earth: Final report, 18:26423 (R;US)

Stanford Univ., CA (United States). Systems Optimization Lab.
A sequential quadratic programming algorithm using an incomplete solution of the subproblem, 18:28191 (R;US)

State Univ. of New York, Alfred, NY (United States). Coll. of Ceramics
Combustion synthesis and engineering of nanoparticles for electronic, structural and superconductor applications: Annual progress report, December 1, 1992–May 31, 1993, 18:26749 (R;US)

State Univ. of New York, Stony Brook, NY (United States). Dept. of Chemistry
[Phase transition in polymer blends and structure of ionomers and copolymers]: [Annual report, April 1, 1989–June 30, 1993], 18:26785 (R;US)

State Univ. of New York, Stony Brook, NY (United States). Dept. of Physics
Research in theoretical nuclear physics: Progress report, 18:27747 (R;US)
The theory of relativistic heavy ion collisions: Progress report, 18:27828 (R;US)

Stevens Inst. of Tech., Hoboken, NJ (United States). Dept. of Physics and Engineering Physics
Investigations of transitions from order to chaos in dynamical systems: Annual progress report, 18:27914 (R;US)

STI Optronics, Bellevue, WA (United States)
Travel to Japan to collaborate on kinetic stability of FRC: Foreign trip report, March 7–26, 1992, 18:27951 (R;US)

Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)
Lower operating temperature in district heating networks - field and laboratory measurements of the properties of cellular concrete insulation, 18:26820 (R;SE;In Swedish)
The effect of chlorine on CFB furnace wall tubes, 18:26719 (R;SE;In Swedish)

Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires
Folding model analysis of $^{58}Ni + {}^{64}Ni$ elastic and inelastic scattering at E_{lab}=203.8 and 219.2 MeV, 18:27840 (R;FR)
Multi-dimensional analysis of high resolution γ-ray data, 18:28136 (R;FR)
Preequilibrium to evaporation residues: dynamical approach to intermediate energy nucleus-nucleus collisions, 18:27838 (R;FR)
Resonant and nonresonant behavior of the heavy-ion reaction $^{14}C + {}^{12}C$, 18:27839 (R;FR)
Stochastic analysis of synchroscan operations of a streak camera, 18:27177 (R;FR)
Temporal and spectral analysis of the synchronization of synchroscan streak cameras, 18:27175 (R;FR)

Towards jitter free synchronization of synchroscan streak cameras by noisy periodic laser pulses, 18:27176 (R;FR)

Strathclyde Univ., Glasgow (United Kingdom)
Wind turbine control systems modelling and design. Phase I and II: Main report, 18:26080 (R;GB)

Studsvik Material AB, Nykoeping (Sweden)
The effect of chlorine on CFB furnace wall tubes, 18:26719 (R;SE;In Swedish)

Superconducting Super Collider Lab., Dallas, TX (United States)
3D-Flow processor for a programmable Level-1 trigger (feasibility study), 18:27206 (R;US)
A digital approach for phase measurement applied to delta-t tuneup procedure, 18:27139 (R;US)
A parallel implementation of particle tracking with space charge effects on an INTEL iPSC/860, 18:27019 (R;US)
A quasi-3D model to predict temperature distribution in SSC magnets due to 3D heat loads, 18:27107 (R;US)
A study of structural integrity of the SSC magnet six-strut support system, 18:27106 (R;US)
Accelerator physics issues at the SSC, 18:26979 (R;US)
Accelerator Readiness Review process for the SSC Linac, 18:27137 (R;US)
An ASD Physics Education Program, 18:27670 (R;US)
An engineering design study of the support platform assembly for the SSC SDC detector, 18:27208 (R;US)
An engineering design study of the transfer bridge for the SSC SDC detector, 18:27130 (R;US)
An optimized formulation for Deprit-type Lie transformations of Taylor maps for symplectic systems, 18:28140 (R;US)
Beam instrumentation and precision timing equipment for the SSC accelerator complex, 18:27114 (R;US)
Beam loss handling at the SSC, 18:27128 (R;US)
Building the repositories to serve, 18:27123 (R;US)
Bunch Shape Monitor for SSCL linac, 18:27141 (R;US)
Business opportunities in the SSCL Global Control System, 18:26975 (R;US)
Collider bypass diode thermal simulations and measurements for the SSCL, 18:27136 (R;US)
Comparisons of processes and performance of SSC-VQP material, 18:27125 (R;US)
Computer simulation and cold model testing of CCL cavities, 18:27146 (R;US)
Conceptual design studies for a He II cooled Low Beta Quad IR Magnets, 18:27122 (R;US)
Conductor design for the GEM Detector Magnet, 18:27132 (R;US)
Cryogenic characteristics of the SSC Accelerator Systems String Test (ASST), 18:27113 (R;US)
Current design of the SSC Interaction Regions, 18:27022 (R;US)
Data acquisition and controls for the SSCL ASST, Phase 1, 18:27108 (R;US)
Databases for analysis of superconducting cable manufacturing, 18:27120 (R;US)
Dealing with abort kicker prefire in the Superconducting Super Collider, 18:27129 (R;US)
Decoupling schemes for the SSC Collider, 18:27023 (R;US)
Design and analysis of the Collider SPXA/SPRA spool piece vacuum barrier, 18:27115 (R;US)
Design and performance of a new 50 mm quadrupole magnet for the SSC, 18:27100 (R;US)
Design and results of the radio frequency quadrupole RF system at the Superconducting Super Collider Laboratory, 18:27109 (R;US)
Design of a model dipole magnet for the SSC High Energy Booster, 18:27118 (R;US)
Dynamic analysis of six-strut supporting system for accelerator magnet, 18:27119 (R;US)
Echo effect in accelerators, 18:27020 (R;US)
Effect of power supply ripple on emittance growth in the collider, 18:27029 (R;US)
Electron beam emittance monitor for the SSC, 18:27134 (R;US)
Emittance growth due to dipole ripple and sextupole, 18:27025 (R;US)
Experimental strength verification of SSC cryogenic transfer line internal suspension system, 18:27103 (R;US)
FDDI experience at the SSCL, 18:27110 (R;US)
General programmable Level-1 trigger with 3D-Flow assembly system for calorimeters of different sizes and event rates, 18:27207 (R;US)
Heat leak measurements and thermal modeling of a mechanical support for a SSC beam tube liner, 18:27104 (R;US)
Integrating PAW, a graphical analysis interface to Sybase, 18:27102 (R;US)
Issues of the transverse feedback systems design at the SSC, 18:27147 (R;US)
Longitudinal instabilities in the MEB, 18:27024 (R;US)
Mechanical integration of an RF volume source and einzel lens LEBT to the SSC RFQ, 18:27144 (R;US)
MTL distributed magnet measurement system, 18:27112 (R;US)
On coupling impedances of pumping holes, 18:27127 (R;US)
Optical measurement of SSC ARC quadrupole cold mass location, 18:27121 (R;US)
Overview and status of beam instrumentation at the SSC, 18:27131 (R;US)
Overview of the superconducting magnet subsystem for the GEM detector at the SSC, 18:27209 (R;US)
Preliminary results from a study of collar lamination variation in SSC Prototype Dipole Magnets, 18:27111 (R;US)
Preliminary testing of the LEB to MEB transfer kicker modulator prototype, 18:27138 (R;US)
Proton-proton scattering contribution to emittance growth, 18:27027 (R;US)
RF cavity for the Medium Energy Booster (MEB) for SSCL, 18:27142 (R;US)
RF systems engineering for the SSC collider rings, 18:27140 (R;US)
Second order chromaticity of the interaction regions in the collider, 18:27028 (R;US)
Simulation studies of the transverse dipole mode multibunch instability for the SSC Collider, 18:27018 (R;US)
SSC High Energy Booster resonance corrector and dynamic tune scanning simulation, 18:27026 (R;US)
Status of the SSC, 18:26977 (R;US)
Status of the SSC LEB rf cavity, 18:27135 (R;US)
Systematic error analysis of rotating coil using computer simulation, 18:27124 (R;US)
Technical status of SSC RF amplifier and accelerating cavity systems, 18:27116 (R;US)
The accelerator systems string test: Objectives, problems, results, anecdotes, and reflections, 18:27101 (R;US)
The design and development of a single piece, sandwhich tube coldmass support post for the SSC Collider Dipole Magnets, 18:27117 (R;US)
The effect of global survey misalignment on the SSC, 18:26978 (R;US)
The provision of IP crossing angles for the SSC, 18:27021 (R;US)
The SSC RFQ-DTL matching section buncher cavities, 18:27143 (R;US)
The SSCL LINAC Control System, 18:27133 (R;US)
The SSCL RFQ system integration, 18:27145 (R;US)
The Superconducting Super Collider: A status report, 18:26974 (R;US)
The thermal behavior of an SSC magnet in an unconditioned outdoor environment, 18:27105 (R;US)
Thermal analysis of the SSC beam scraper, 18:27126 (R;US)
What the quality philosophy brings to a research and development environment like the SSC, 18:26976 (R;US)

Svensk Energi Utveckling AB, Stockholm (Sweden)
Operating experiences from small and medium sized wind power plants 1989-1991: Final report, 18:26064 (R;SE;In Swedish)

Tennessee Valley Authority, Muscle Shoals, AL (United States)
- Environmental realities in the 90's: Proceedings, 18:26539 (R;US)
- Utilization of by-product ammonium sulfate, 18:26540 (R;US)

Texas A and M Univ., College Station, TX (United States)
Standard model tests in muon decay with the MEGA detector: Progress report, July 16, 1992–May 31, 1993, 18:27773 (R;US)

Texas A and M Univ., College Station, TX (United States). Dept. of Mechanical Engineering
DEPOSITION: Software to calculate particle penetration through aerosol transport systems: Final report, 18:27353 (R;US)

Texas Univ., Austin, TX (United States). Center for Particle Physics
The geometric phase in quantum physics, 18:27671 (R;US)

Texas Univ., Austin, TX (United States). Center for Petroleum and Geosystems Engineering
Consolidated Research Program, United States Gulf Coast Geopressured-Geothermal Program: First quarterly report, January 1, 1993–March 3, 1993, 18:26044 (R;US)

Texas Univ., Austin, TX (United States). Fusion Research Center
Active probing of plasma edge turbulence and feedback studies on the Texas Experimental Tokamak (TEXT), 18:27947 (R;US)

Tills (Jack) and Associates, Inc., Albuquerque, NM (United States)
Containment loads scoping calculations for severe nuclear reactor accidents, 18:26383 (R;US)

Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study
A new cooling and focusing device for ion guide, 18:27060 (R;JP)
Report of an INS two-day meeting on roles of Pauli principle in few-body problems: Discussions with Prof. V.I. Kukulin, 18:27820 (R;JP)

Toledo Univ., OH (United States). Dept. of Chemical Engineering
Design and development of a novel gas desulfurization process using hollow fiber membranes to stimulate the utilization of high sulfur Ohio coal: Final report, 18:25555 (R;US)

TRW Energy Development Group, McLean, VA (United States)
ICOP: Financial Model Industrial Cogeneration, 18:28156 (CM;US)

TRW Space and Technology Group, Redondo Beach, CA (United States). Applied Technology Div.
Molten-Caustic-Leaching (Gravimelt) System Integration Project, Phase 2: Topical report for test circuit operation, 18:25539 (R;US)
Molten-Caustic-Leaching (Gravimelt) System Integration Project, Phase 2: Topical report for test circuit maintenance, refurbishment, modification, and off-line operation, 18:25540 (R;US)

Tullis Engineering Consultants, Logan, UT (United States)
Cavitation guide for control valves, 18:26242 (R;US)

Tuskegee Univ., AL (United States). Dept. of Chemical Engineering
Liquid chromatographic analysis of coal surface properties: Quarterly progress report, January–March 1993, 18:25546 (R;US)

U

Union Electrica, SA, Madrid (Spain)
Assessment of the turbine trip transient in Cofrentes NPP with TRAC-BF1, 18:26370 (R;US)

UNISOR, Oak Ridge, TN (United States)
Deformation studies in the extremely neutron-deficient praseodymium, neodymium and promethium isotopes, 18:27813 (R;US)

United Nations Development Programme
Agricultural production - Phase 2. Indonesia. Sources and sinks of nitrogen-E phosphorus-based nutrients in cropping systems: Technical report. Report prepared for the Government of the Republic of Indonesia, 18:27588 (R;XA)
Application of isotopes and radiation to increasing agricultural production - Phase 2. Indonesia. Project findings and recommendations: Terminal report. Report prepared for the Government of the Republic of Indonesia, 18:27589 (R;XA)
Fate of trypanocidal drugs in cattle (chemotherapy of trypanosomiasis). Kenya: Terminal report. Report prepared for the Government of Kenya, 18:27590 (R;XA)
Nuclear safety. Romania. Defective fuel performance evaluation: Technical report. Report prepared for the Government of Romania, 18:26173 (R;XA)

United Nations Economic Commission for Europe (ECE), Geneva (Switzerland)
Contribution to the ministerial conference "environment for Europe", Lucerne, Switzerland, 28-30 April 1993. As adopted by the Senior Advisers to ECE Governments on Environmental and Water Problems on 19 March 1993, 18:26425 (R;XU)
Contribution to the ministerial conference "environment for Europe", Lucerne, Switzerland, 28-30 April 1993. Proposals for inclusion in the ministerial declaration: Transmitted by the Senior Advisers to ECE Governments on Environmental and Water Problems to the Expert Group for the Conference pursuant to the decision taken at their sixth session (ECE/ENVWA/29, para. 18), 18:26426 (R;XU)

United Technologies Research Center, East Hartford, CT (United States)
A proposed mechanism for the pyrolysis of diborane, 18:26885 (R;US)

Universal Oil Products Co., Des Plaines, IL (United States)
Fundamental reaction pathways during coprocessing, 18:25527 (R;US)

University of Southwestern Louisiana, Lafayette, LA (United States). Acadiana Research Lab.
A study of hydrocarbons associated with brines from DOE geopressured wells: Final report, 18:26051 (R;US)

University of Wales Coll. of Cardiff (United Kingdom). Welsh School of Architecture
Solar building study. Final report: Albert Hall Memorial Housing, Coalville, Leicestershire, 18:26018 (R;GB)

USDOE Albuquerque Field Office, NM (United States). Uranium Mill Tailings Remedial Action Project Office
Remedial action plan and site design for stabilization of the inactive uranium mill tailings sites at Rifle, Colorado: Final report: Volume 3, Appendix F, Final design, specifications, and drawings, 18:25862 (R;US)

USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States)
Geothermal Reservoir Technology Research Program: Abstracts of selected research projects, 18:26038 (R;US)
Utility emissions associated with electric and hybrid vehicle (EHV) charging, 18:26560 (R;US)

USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health
Eleventh DOE workshop on personnel neutron dosimetry, 18:27632 (R;US)
Industry/Department of Energy workshop on chemical safety: Summary and highlights, 18:26420 (R;US)

USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). RCRA/CERCLA Div.
RCRA corrective action program guide (Interim), 18:25900 (R;US)

USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States)
DOE methods for evaluating environmental and waste management samples: Revision 1, 18:25687 (R;US)
Radioactive waste management and environmental restoration issues in England: Foreign trip report, January 24–29, 1993, 18:26424 (R;US)
Status report on roadmap headquarters issue resolution activities, 18:25684 (R;US)

USDOE Bartlesville Project Office, OK (United States)
Contracts for field projects and supporting research on enhanced oil recovery: Progress review No. 71, quarter ending June 30, 1992, 18:25584 (R;US)

USDOE Bonneville Power Administration, Portland, OR (United States). Div. of Fish and Wildlife
Integrated hatchery operations team: Existing policy affecting hatcheries in the Columbia River Basin: Combined reports: Annual report, 1992, 18:25984 (R;US)
Integrated hatchery operations team: Operation plans for anadromous fish production facilities in the Columbia River Basin: Annual report 1992, Volume 3, 18:25985 (R;US)
Integrated hatchery operations team: Operation plans for anadromous fish production facilities in the Columbia River Basin: Annual report 1992, Volume 4, 18:25986 (R;US)

Operation plans for anadromous fish production facilities in the Columbia River Basin: Volume 2: Idaho Department of Fish and Game Hatcheries, Annual report 1992, 18:25987 (R;US)
Redfish Lake sockeye salmon captive broodstock rearing and research: Annual report, 1992, 18:25983 (R;US)

Office of Inspector General semiannual report to Congress, October 1, 1992–March 31, 1993, 18:26411 (R;US)
Semiannual report to Congress on Inspector General audit reports for the period October 1, 1992 to March 31, 1993, 18:26407 (R;US)

USDOE Office of Inspector General, Washington, DC (United States). Capital Regional Audit Office
Review of DOE's personnel security clearance program, 18:25887 (R;US)

USDOE Office of Inspector General, Washington, DC (United States). Office of Inspections
Inspection of management of excess personal property at Rocky Flats, 18:28077 (R;US)

USDOE Office of Procurement, Assistance and Program Management, Washington, DC (United States)
Department of Energy listing of awardee names active awards, 18:28078 (R;US)

USDOE Office of the Associate Deputy Secretary for Field Management, Washington, DC (United States)
DOE real property: A yearly statistical handbook, Fiscal year 1992, 18:28074 (R;US)

USDOE Pittsburgh Energy Technology Center, PA (United States)
Flow of granular materials down an inclined plane, 18:26922 (R;US)
The Coal Tech Advanced Cyclone Combustor Demonstration Project: A DOE assessment, 18:25561 (R;US)
Transformations of inorganic coal constituents in combustion systems: Volume 1, sections 1–5: Final report, 18:25571 (R;US)
Transformations of inorganic coal constituents in combustion systems: Volume 2, Sections 6 and 7: Final report, 18:25572 (R;US)
Transformations of inorganic coal constituents in combustion systems: Volume 3, Appendices: Final report, 18:25573 (R;US)
Travel to attend the International Energy Agency carbon dioxide symposium at Oxford, United Kingdom: Foreign trip report, March 27–April 3, 1993, 18:25588 (R;US)
[A trip to Krakow, Poland to investigate their clean fossil fuels and energy efficiency program]: Foreign trip report, November 6–15, 1992, 18:27321 (R;US)

USDOE Richland Field Office, WA (United States)
300-FF-1 physical separations CERCLA treatability test plan: Revision 1, 18:25861 (R;US)
Annual report for RCRA groundwater monitoring projects at Hanford Site Facilities for 1992, 18:27487 (R;US)
Sampling and analysis of 100 Area springs, 18:27486 (R;US)
Semiworks source aggregate area management study report, 18:25860 (R;US)

USDOE Savannah River Operations Office, Aiken, SC (United States)
Establishment of a viable population of red-cockaded woodpeckers at the Savannah River Site: Annual report, FY1992, 18:27514 (R;US)

USDOE Yucca Mountain Site Characterization Project Office, Las Vegas, NV (United States)
Yucca Mountain Site Characterization Project Technical Data Catalog, 18:25697 (R;US)

USDOE, Washington, DC (United States)
Environment, safety and health progress assessment of the Lawrence Livermore National Laboratory, 18:25855 (R;US)
Environment, safety and health progress assessment of the Brookhaven National Laboratory (BNL), 18:26422 (R;US)
Travel to Korea to attend the Eight US-Korea Joint Workshop on coal Utilization Technology and to conduct preliminary design review of the KIER Combustion Facility: Foreign trip report, August 16–28, 1992, 18:25559 (R;US)

Utah Univ., Salt Lake City, UT (United States). Dept. of Chemistry
Thermochemistry of transition metal clusters: Technical progress report, 18:26860 (R;US)

Utah Univ., Salt Lake City, UT (United States). Dept. of Fuels Engineering
Sequential low-temperature depolymerization and liquefaction of US coals: Progress report No. 1, October 1–December 31, 1986, 18:25537 (R;US)

Utah Univ., Salt Lake City, UT (United States). Dept. of Physics
F center-molecular ion couples in alkali halides: Magneto-optics study (part two). Spin lattice relaxation time and electron spin memory, 18:26794 (R;IT;In Italian)

V

Valtion Teknillinen Tutkimuskeskus, Helsinki (Finland). Nuclear Engineering Lab.
Assessment of RELAP5/MOD2 using the test data of REWET-II reflooding experiment SGI/R, 18:26155 (R;US)

Vanderbilt Univ., Nashville, TN (United States). Dept. of Physics
High spin states in neutron rich nuclei from spontaneous fission, 18:27836 (R;US)

Varian Associates, Inc., Palo Alto, CA (United States)
Long-pulse operation of a gyrotron with beam/rf separation, 18:28024 (R;US)

Vattenfall AB, Vaellingby (Sweden)
Ageing in embankment dams: Pilot study, 18:25993 (R;SE;In Swedish)
Biofuel-fired electricity and heat generation in a large district heating system - system studies using the Martes energy system model, 18:26448 (R;SE;In Swedish)
Biomass production in poplar plantations, 18:25941 (R;SE;In Swedish)
Chemical modelling of trace elements in pore water from PFBC residues containing ammonia, 18:27510 (R;SE)
Development study of a large wind turbine system, Third generation: Final report phase 1 - general conditions, 18:26090 (R;SE;In Swedish)
Environmentally adjusted oil and grease, 18:25991 (R;SE;In Swedish)
Fish barriers: Methods to divert fish (avoidance, attraction) at hydroelectric power installations, 18:25992 (R;SE;In Swedish)
Forest fuel reduces the nitrogen load, 18:25977 (R;SE;In Swedish)
Long-distance transport of bioenergy fuel to VEGA, 18:25972 (R;SE;In Swedish)
Mercury content in fish from newly impounded reservoirs, 18:27509 (R;SE;In Swedish)
Sweden's electric power supply 1992, 18:26468 (R;SE;In Swedish)
Treatment of peat bogs harvested by deep digging technique: A literature study, 18:25557 (R;SE;In Swedish)

Vermont Univ., Burlington, VT (United States)
The development of in vitro mutagenicity testing systems using T-lymphocytes: Research progress report, November 1, 1992–October 31, 1993, 18:27606 (R;US)

Vertical Axis Wind Turbines Ltd., Henel Hempstead (United Kingdom)
Integrated research programme for vertical axis wind turbine blade aerodynamics under environmental and wind tunnel conditions: Executive summary, 18:26079 (R;GB)

Vienna Univ. (Austria). Inst. fuer Theoretische Physik
General solution of Chew-Low equations for πN scattering in terms of θ-functions, 18:27800 (R;AT)
QCD condensate values from analytical structure of pion's form factor via sum rules methods, 18:27762 (R;AT)
Relative concavity of ground state energies as functions of a coupling constant, 18:27698 (R;AT)

Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). Dept. of Crop and Soil Environmental Sciences
Perennial species for optimum production of herbaceous biomass in the Piedmont (Management study, 1987–1991): Final report, 18:25944 (R;US)

Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). Dept. of Physics
[Study of electroweak interactions]: Final report [February 1, 1992–January 31, 1993], 18:27770 (R;US)
Viscoustech, Allison Park, PA (United States)
Stability of flows in fluidized beds: Final report, 18:25560 (R;US)

W

Warren Spring Lab., Stevenage (United Kingdom)
An emissions audit from a chain-grate stoker burning d-RDF, 18:25973 (R;GB)
An emissions audit of a biomass combustor burning treated wood waste, 18:25974 (R;GB)
An emissions audit of a chain grate stoker burning coal, 18:25577 (R;GB)
An emissions audit of a purpose built whole bale straw combustor, 18:25975 (R;GB)
Washington Dept. of Fisheries, Olympia, WA (United States)
Columbia River coordinated information system report on information needs, 18:25989 (R;US)
Integrated hatchery operations team: Operation plans for anadromous fish production facilities in the Columbia River Basin: Annual report 1992, Volume 4, 18:25986 (R;US)
Washington Univ., Seattle, WA (United States)
Diversity and richness of benthic insects in three cold desert spring-streams, 18:27504 (R;US)
Washington Univ., Seattle, WA (United States). Dept. of Applied Mathematics
Chaos and microbial systems: Final project report, July 1989–July 1992, 18:28141 (R;US)
Washington Univ., Seattle, WA (United States). Dept. of Physics
Many-body corrections in XAFS, 18:27867 (R;US)
Measuring strangeness in the nucleon, 18:27802 (R;US)
Recent developments in multiple-scattering calculations of XAFS and XANES, 18:27883 (R;US)
Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory
The fractional quantum hall effect and the rotation group, 18:27934 (R;US)
Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Physics
Construction of realistic superstring standard-like models, 18:27763 (R;IL)
Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div.
Waste Isolation Pilot Plant: Site environmental report for calendar year 1991, 18:25699 (R;US)
WIPP supplementary roof support system Room 1, Panel 1: Geotechnical field data analysis report, 18:25700 (R;US)
Westinghouse Hanford Co., Richland, WA (United States)
A strategy for resolving high-priority Hanford Site radioactive waste storage tank safety issues, 18:25790 (R;US)
Action plan for responses to abnormal conditions in Hanford Site radioactive waste tanks with high organic content, 18:25768 (R;US)
An approach for sampling solid heterogeneous waste at the Hanford Site waste receiving and processing and solid waste projects, 18:25800 (R;US)
Assay development status report for total cyanide, 18:25777 (R;US)
Assessment of gas accumulation and retention – Tank 241-SY-101, 18:25773 (R;US)
BAKEOUT: A computer program for predicting diffusive outgassing from stainless steel, 18:26734 (R;US)
Case study: Managing potentially contaminated records, 18:25881 (R;US)
Characterization of past and present solid waste streams from the plutonium finishing plant, 18:25774 (R;US)
Characterization of past and present solid waste streams from the Plutonium-Uranium Extraction Plant, 18:25778 (R;US)
Characterization of past and present solid waste streams from 231-Z, 18:25782 (R;US)
Co-disposal of mixed waste materials, 18:25809 (R;US)
Design of the Waste Receiving and Processing Module 2A Facility, 18:25799 (R;US)
Developing waste separations technologies in the Underground Storage Tank – Integrated Demonstration Program, 18:25808 (R;US)
Facility effluent monitoring plan for 242-A Evaporator facility: Revision 1, 18:25769 (R;US)
Ferrocyanide safety program: Credibility of drying out ferrocyanide tank waste by hot spots, 18:25779 (R;US)
Ferrocyanide waste simulant characterization, 18:25776 (R;US)
FT-IR analyses of the oxidative decomposition products of cyanoferrate wastes, 18:25789 (R;US)
Hanford Site radioactive mixed waste thermal treatment initiative, 18:25807 (R;US)
High heat tank safety issue resolution program plan, 18:25771 (R;US)
In situ electrochemical characterization of grouted radioactive waste, 18:25788 (R;US)
Long-term climate change assessment study plan for the Hanford Site Permanent Isolation Barrier Development Program: Revision 1, 18:25772 (R;US)
Low specific activity and surface-contaminated objects determinations key to managing low-level wastes, 18:25676 (R;US)
Low-level radioactive mixed waste land disposal facility – Permanent disposal, 18:25801 (R;US)
Low-level waste disposal - Grout issue and alternative waste form technology, 18:25795 (R;US)
Maintenance Implementation Plan for B Plant: Revision 1, 18:25810 (R;US)
Managing Hanford Site solid waste through strict acceptance criteria, 18:25783 (R;US)
Master Safety Analysis Report (SAR) approach for solid waste treatment, storage, and disposal facilities, 18:25806 (R;US)
Mobile inspection and repackaging unit, 18:25786 (R;US)
Moisture monitoring of ferrocyanide tanks: An evaluation of methods and tools, 18:25781 (R;US)
Nondestructive assay of boxed radioactive waste, 18:25784 (R;US)
Nuclear Criticality Technology and Safety Project parameter study database, 18:26916 (R;US)
Operator involvement in plant decision making and self-assessment, 18:26329 (R;US)
Organizational impacts to conduct of operations, 18:25803 (R;US)
Parametric study of radionuclide characterization – Low-level waste: Draft, 18:25780 (R;US)
Performance audit, 18:25883 (R;US)
Preliminary standard review guide for Environmental Restoration/Decontamination and Decommissioning safety analyses, 18:25882 (R;US)
Quarterly report on Defense Nuclear Facilities Safety Board Recommendation 90-7 for the period ending December 31, 1992, 18:25770 (R;US)
Radioactive mixed waste disposal, 18:25785 (R;US)
Recent results from characterization of ferrocyanide wastes at the Hanford Site, 18:25794 (R;US)
Recycling and surplus chemical programs, 18:26541 (R;US)
Resolving the safety issue for radioactive waste tanks with high organic content, 18:25791 (R;US)
Sampling and analysis of 100 Area springs, 18:27486 (R;US)
Tank 101-SY Window E core sample: Interpretation of results, 18:25775 (R;US)
Tank farm surveillance and waste status summary report for October 1992, 18:25765 (R;US)
Tank farm surveillance and waste status summary report for November 1992, 18:25766 (R;US)
Tank farm surveillance and waste status summary report for December 1992, 18:25767 (R;US)
Tank waste chemistry: A new understanding of waste aging, 18:25792 (R;US)
Tank waste pretreatment issues, alternatives and strategies for resolution, 18:25805 (R;US)
The evolving roles of technical communicators within a government project: The Hanford Site, 18:28215 (R;US)
The impact of safety analyses on the design of the Hanford Waste Vitrification Plant, 18:25796 (R;US)

The United States Department of Energy process for performance assessment for disposal of low-level radioactive waste, 18:25804 (R;US)
Thulium heat sources for space power applications, 18:26208 (R;US)
Time and motion simulation of the WRAP Module 1 Facility, 18:25802 (R;US)
Tolerancing requirements for remote handling at the Hanford Waste Vitrification Plant, 18:25797 (R;US)
Travel to United Kingdom and Germany to transfer foreign landfill barrier and stabilization technologies both to and from the US Department of Energy complex sites: Foreign trip report, March 4–June 30, 1992, 18:25857 (R;US)
Use of the USQ process with an operating SAR for the shutdown/terminal cleanout of the PUREX facility, 18:25651 (R;US)
Vadose zone characterization of highly radioactive contaminated soil at the Hanford Site, 18:25787 (R;US)
Waste separations and pretreatment technology development in the Underground Storage Tank–Integrated Demonstration Program, 18:25798 (R;US)
[Travel to Belarus and Russia to engage in bilateral discussions on a broad range of human resources topics]: Foreign trip report, April 13–26, 1992, 18:26415 (R;US)

Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States)
ICCP Environmental Monitoring Report CY-1992, 18:27378 (R;US)
ICPP Waste Management Technology Development Program, 18:25811 (R;US)
Implementation of the hazardous debris rule, 18:26542 (R;US)
NO_x Abatement Pilot Plant 90-day test results report, 18:25848 (R;US)
Noble gas, a potential nuclear proliferation indicator, 18:26566 (R;US)
Robotic systems for the high level waste tank farm replacement project at INEL, 18:25812 (R;US)
SHEAN (Simplified Human Error Analysis code) and automated THERP, 18:26386 (R;US)
Summary of meeting on disposal of LET&D HEPA filters, 18:25813 (R;US)
Technical specifications manual for the MARK-1 pulsed ionizing radiation detection system: Volume 1, 18:26567 (R;US)

Westinghouse Savannah River Co., Aiken, SC (United States)
A comparison of response spectrum and direct integration analysis methods as applied to a nuclear component support structure: Revision 1, 18:26387 (R;US)
Acceptance criteria for reactor coolant pumps and valves, 18:26331 (R;US)
Ammonium generation during SRAT cycle, 18:25827 (R;US)
An investigation of Inventory Differences, 18:25819 (R;US)
Assessment of radiocarbon in the Savannah River Site Environment, 18:27379 (R;US)
Canonical correlation of waste glass compositions and durability, including pH, 18:25823 (R;US)
Carbon-14 removal for disposal of reactor deionizer resins, 18:25831 (R;US)
Comparison of a constraint directed search to a genetic algorithm in a scheduling application, 18:25642 (R;US)
Composite refraction-reflection stack sections: Tracing faults in the Atlantic coastal plain sediments, 18:27464 (R;US)
Conditions for precipitation of copper phases in DWPF waste glass: Revision 1, 18:25817 (R;US)
Cooler and particulate separator for an off-gas stack, 18:27357 (PA;US)
Data qualification summary for 1985 L-Area AC Flow Tests, 18:26209 (R;US)
Demonstration of a utility industry horizontal drilling system: Horizontal well AMH-5 installation report, 18:25885 (R;US)
Demonstration of risk-based decision analysis in remedial alternative selection and design, 18:27465 (R;US)
Design rules under development by ASME B and PV Subgroup on Containment Systems for Spent Fuels and High Level Waste Transport Packagings, 18:26917 (R;US)
Development of exposure scenarios for CERCLA risk assessments at the Savannah River Site, 18:25814 (R;US)
Development of flaw evaluation and acceptance procedures for flaw indications in the cooling water system at the Savannah River Site K Reactor, 18:26332 (R;US)
DWPF recycle stream corrosion tests, 18:25835 (R;US)
DWPF saltstone study: Effects of thermal history on leach index and physical integrity: Part 2, Final report: Revision 1, 18:25825 (R;US)
Effect of power on demand surface and flow instability for annular geometry fuel elements with upflow of coolant, 18:26333 (R;US)
Electrochemical processing of nitrate waste solutions: Phase 2, Final report, 18:25834 (R;US)
F-Area Acid/Caustic Basin groundwater monitoring report: Fourth quarter 1992 and 1992 summary, 18:27468 (R;US)
Functional Analysis and Thermal-Hydraulics Program Plan, 18:26389 (R;US)
Further code validation of Technical Specification Bases, 18:26336 (R;US)
GAM-HEAT: A computer code to compute heat transfer in complex enclosures: Revision 2, 18:26392 (R;US)
Ion exchange technology assessment report, 18:25826 (R;US)
K-Area Acid/Caustic Basin groundwater monitoring report: Fourth quarter 1992 and 1992 summary, 18:27469 (R;US)
Materials compatibility of hydride storage materials with austenitic stainless steels, 18:26883 (R;US)
Materials performance in prototype Thermal Cycling Absorption Process (TCAP) columns, 18:25912 (R;US)
Measurement of cesium and mercury emissions from the vitrification of simulated high level radioactive waste, 18:25815 (R;US)
Monosodium titanate particle characterization, 18:25833 (R;US)
Pilot scale vitrification studies on hazardous and mixed wastes, 18:25822 (R;US)
Preliminary site selection report for the new sanitary landfill at the Savannah River Site, 18:27466 (R;US)
Probabilistic treatment of a long-term shutdown event with peak xenon and failed rods: Task: PRA, 18:26391 (R;US)
Projected tritium releases from F & H Area Seepage Basins and the Solid Waste Disposal Facilities to Fourmile Branch, 18:27467 (R;US)
Radiolytic hydrogen production from process vessels in HB line - production rates compared to evolution rates and discussion of LASL reviews, 18:25828 (R;US)
Reactor safety research section probability of heat exchanger leaks, 18:26335 (R;US)
RELAP5/MOD2.5 simulation results for the Separate Effects Test experiment series, Phase 1, 18:26305 (R;US)
RELAP5/MOD3 analysis of a heated channel in downflow, 18:26330 (R;US)
Relationship between borosilicate glass composition, structure, and durability test response (SRS), 18:25816 (R;US)
Results of the second quarter tritium survey of the F- and H-Area seeplines, September 1992, 18:27470 (R;US)
Reviews of computing technology: Object-oriented technology, 18:28205 (R;US)
Revisions to the hydrogen gas generation computer model, 18:25832 (R;US)
Risk assessment for nuclear processes at the Savannah River Site: Revision 1, 18:25884 (R;US)
Savannah River Site disaggregated seismic spectra, 18:25886 (R;US)
Savannah River Site TIER TWO report 1992: Emergency and Hazardous Chemical Inventory report, 18:25830 (R;US)
Seismic II over I Drop Test Program results and interpretation, 18:26396 (R;US)
